Comments on DEIS, of August 2007

I find no discussion in this document about the coming problems with climate change (global warming) that will affect the region.

How will climate change affect the region, the wildlife & botanical habitats?

How will management evolve with climate changes as they occur over the coming decades?

How will tree harvesting be affected by climate change & will harvesting levels be re-evaluated based on climate change actions & results.

How will streams be affected by climate change so as to protect & promote trout & other fish populations?

Climate change is a significant scientific reality, so I find it very odd & distinctly un-scientific that it is not discussed in detail.

Thank-you, Michael J Mawinny
