

## Chapter 2 Proposed RMP

*Wild Horses on BLM Public Lands*

## Proposed RMP Development.

BLM resource specialists; representatives of organizations, public interest groups, Indian tribes, and Federal, State, and local agencies; and members of the general public identified the following planning issues and management concerns during scoping for the Challis RMP/EIS:

### Issues

**Range Management** - Rangeland management actions affecting forage allocations have the potential for conflict among competing users. Other rangeland issues, such as riparian area grazing and watershed management, have the potential for conflict over the use of resources, as well as conflict with legal requirements such as those contained in the Endangered Species Act and the Clean Water Act. Related management concerns are *Fire Management, Livestock Grazing, Noxious Weed Infestations, Rangeland Vegetation Treatment Projects, Upland Watershed, Wild Horses and Burros, and Wildlife Habitat.*

**Water Related Resource Management** - Important fish habitat for anadromous and resident fish species found in the Challis Resource Area is of concern because of its biological, recreational, traditional cultural, and economic values. Scarcity of some anadromous fish species (Snake River spring-summer chinook salmon, Snake River sockeye salmon, and Snake River steelhead rainbow trout) and resident fish species (bull trout) has resulted in their listing as threatened or endangered under the Endangered Species Act. Recovery strategies for listed species, water quality requirements prescribed by the Clean Water Act, and protection of identified beneficial uses may impact future uses of the public lands. These new emphases have the potential to create substantial public concern about the use of a resource value and possible economic impacts resulting from compliance with legal requirements. Related management concerns include *Fisheries, Floodplain/Wetland Areas, Minimum Streamflow, Riparian Areas, and Water Quality.*

**Land Tenure and Access** - Public and private lands are interspersed within the boundaries of the Challis Resource Area. Geologic landforms in the area, along with the interspersed ownership patterns, have contributed to unauthorized agricultural and occupancy use. Removal of the unauthorized use, land exchanges, or public sales of parcels of land are methods sometimes used to resolve unauthorized use conflicts. In addition, specific parcels of public land may be identified for exchange for private parcels containing important resource values. Such actions can result in public concern relating to the use or preservation of a resource, loss of a resource or environmental value, conflict over the use of resources, and concern over the increase or decrease of the public land base. The related management concern is *Land Tenure and Access.*

**Special Management Areas** - Special management designations vary according to the resource needs being addressed. Two kinds of special designations are being considered for the Challis RA: (1) additional Areas of Critical Environmental Concern needed to address

critical elk and bighorn sheep habitats, cultural resources, sensitive plants, and fish habitat values; and (2) suitability findings which may result in Congressional designation of Wild, Scenic, or Recreational Rivers (as defined by the Wild and Scenic Rivers Act). Designating, or not designating, may lead to substantial public concern over the special management of these resource values. Related management concerns are *Areas of Critical Environmental Concern*, *Wilderness Study Areas - Management if Released from Wilderness Review*, and *Wild and Scenic Rivers*.

### **Additional Management Concerns**

The following additional management concerns identified during the scoping process are also discussed in the Challis PRMP/FEIS, in order to provide complete disclosure and analysis of resources, programs, and land uses in the Challis Resource Area: *Air Quality*, *Biological Diversity*, *Cultural Resources*, *Forest Resources*, *Hazardous Materials Management*, *Minerals*, *Off-highway Vehicle Use*, *Paleontological Resources*, *Recreation Opportunities and Visitor Use*, *Special Status Species*, *Transportation*, *Tribal Treaty Rights*, and *Visual Resources*.

The Challis Draft RMP/EIS described and analyzed five alternative Resource Management Plans (including the option of no action) which addressed the identified planning issues and management concerns (see Draft RMP/EIS, Volume 2). Three additional alternatives were considered during Draft RMP development, but eliminated from detailed study (see Draft RMP/EIS, p. 23).

During the public comment period for the Draft RMP/EIS, the BLM received written comments from Federally recognized tribes, State agencies, various committees, businesses, and organizations, and members of the general public (see PRMP/FEIS, Volume 2, Chapter 5). Based on these written comments and internal BLM recommendations, the BLM revised the Preferred Alternative (Alternative 2) described in the Draft RMP/EIS. The BLM considered one additional alternative (no timber harvest) during development of the PRMP, but eliminated this option from detailed study.

The BLM made the following changes to the Preferred Alternative when developing the Proposed RMP:

- Off-highway vehicle use limitations were expanded, in order to reduce the surface disturbance and other impacts of off-road vehicle travel on vegetation, soils, wildlife, cultural, fisheries, and other resources. The PRMP limits OHV use on the entire Resource Area to existing roads, vehicle ways and trails, unless more restrictive area limitations or closures apply.
- Various decisions were revised to (a) clarify the BLM's intent, (b) improve the BLM's ability to measure and implement the actions consistently, and (c) provide an overall increase in protection of upland, riparian, and aquatic habitats.
- Emphasis on watershed assessment as a component of integrated resource activity planning and site-specific project planning was incorporated as a standard operating procedure.

## Amendment of the Little Lost - Birch Creek MFP.

The Challis Proposed RMP proposes to designate approximately 4,714 acres managed by the Big Butte Resource Area - BLM as part of the Donkey Hills Area of Critical Environmental Concern (ACEC). ACEC designation can only be pursued during the land use planning process, and proposed designations must be evaluated through an environmental impact statement (EIS). For this reason, the Challis PRMP/FEIS discusses (1) how proposed designation of the Donkey Hills ACEC would amend the current land use plan for the 4,714-acre affected area; and (2) the expected environmental consequences of ACEC designation in the affected area.

The acreage proposed as part of the Donkey Hills ACEC lies adjacent to the Challis Resource Area in T10N, R25E (see *Map 4: ACECs - General Location* and *Map 8: ACECs - Summit Creek ACEC/RNA and Donkey Hills ACEC*). The resources and land uses on these 4,714 acres are presently managed according to the Little Lost-Birch Creek Management Framework Plan (MFP) (USDI-BLM June, 1981). If designated as an ACEC, the 4,714-acre portion of the Big Butte RA would continue to be managed according to the Little Lost-Birch Creek MFP, *except* the decisions stated in the PRMP, ACECs - Donkey Hills ACEC, #6-12, pp. 32-33 would amend the Little Lost-Birch Creek MFP.

**Affected Environment:** Several resources are present and several land uses are allowed within the proposed ACEC designation area in the Big Butte Resource Area. According to information provided by the Big Butte Resource Area (USDI-BLM January 29, 1996), the Donkey Hills area is crucial big game winter range. Logging in the Donkey Hills area is deferred, because helicopter logging is currently not economically feasible and conventional logging methods would produce adverse impacts on the steep terrain. The affected area contains approximately 886 acres of productive forest land; the principal tree species is Douglas-fir. Most of the forest land is on slopes ranging from 40 to 60 percent, which limits logging opportunities by conventional methods (Lowe; personal communication March 1, 1996, and memorandum March 5, 1996). Livestock grazing is permitted in the area, but livestock use is light because of slope considerations and a lack of water. The area is open to off-highway vehicle use yearlong; however, OHV use in the area is light and only about half of OHV visits in the area are for off-road use (Boggs, personal communication, February 1, 1996). The area is open to minerals exploration and development, but minerals potential is low (Horsburgh, personal communication, Feb. 15, 1996). Fire suppression strategy is to aggressively suppress all wildfires (Martin, G. personal communication, Feb. 16, 1996). Land exchanges to acquire State-owned sections in the Little Lost Valley are a priority.

**Environmental Consequences:** Designating the ACEC for elk habitat values would ensure that elk habitat values are a priority consideration in land use decisions. Changing the OHV use designation from "open" yearlong to a seasonal (winter) closure and yearlong limitation to existing roads and vehicle ways would have the impacts stated below; however, these impacts are likely to be minor, since the area has historically received very little off-road or on-road vehicle use.

- (a) Seasonal OHV use limitations would reduce the potential for disturbance of wintering big game animals and adverse effects from stress.

(b) Seasonal and yearlong OHV limitations may affect OHV use for recreational purposes and OHV use to access public lands for forest management, livestock management, and minerals exploration and development.

No other impacts to livestock management or minerals exploration and development would be expected. Logging in the Big Butte portion of the ACEC would continue to be deferred. Should helicopter logging become economically feasible, timber harvest stipulations would help maintain big game cover values, but put some constraints on harvest methods. Continued livestock use should not conflict with the maintenance of ACEC values, since livestock use is light. Full suppression of wildfires and general guidance for wildfire suppression tactics would help ensure maintenance of forage and cover values on big game winter habitat.

## Comparison of the Proposed RMP and Preferred Alternative.

The Proposed RMP is very similar to the Preferred Alternative (Alternative 2) described and analyzed in the Draft RMP/EIS. However, the PRMP increases the level of protection to aquatic, riparian, and upland resources by limiting off-highway vehicle use to existing roads, vehicle ways, and trails throughout the Resource Area. The PRMP also clarifies numerous decisions, and thereby improves the BLM's ability to implement effective management in order to address resource concerns and improve resource conditions. Finally, the PRMP includes an emphasis on integrated resource activity planning and watershed assessment, in order to ensure that individual project proposals are considered within the context of broader landscapes. As a result of these modifications to the Preferred Alternative, the BLM believes the Proposed RMP would more rapidly and effectively improve resource conditions, while still providing for consumptive resource uses such as timber harvest, minerals exploration and development, and livestock grazing.

The following paragraphs summarize the environmental consequences of implementing the Proposed RMP. These impacts may be compared with the Summary of Environmental Consequences and Comparison of Alternatives stated in the Draft RMP/EIS (see Draft RMP/EIS, pp. 25-42).

The BLM's analysis of impacts indicates Proposed RMP decisions would have the following impacts on resources and land uses in the Challis Resource Area:

- **Resource Values Maintained:** PRMP decisions would maintain the following resource values which are already in good condition: Air quality; visual quality; unique resource values on approximately 14,290 acres of existing Areas of Critical Environmental Concern (ACECs); primitive values in suitable portions of the Jerry Peak and Burnt Creek WSAs, if released from wilderness review; and wild horse populations.
- **Protection of Resource Values Increased:** PRMP decisions would increase the level of consideration and protection provided to known and possible cultural and paleontological resources, biological diversity, special status species, visual resources, unique resource values on about 73,916 acres of new ACECs, and Wild and Scenic Rivers values on 15 segments identified as eligible for further study or suitable for designation.

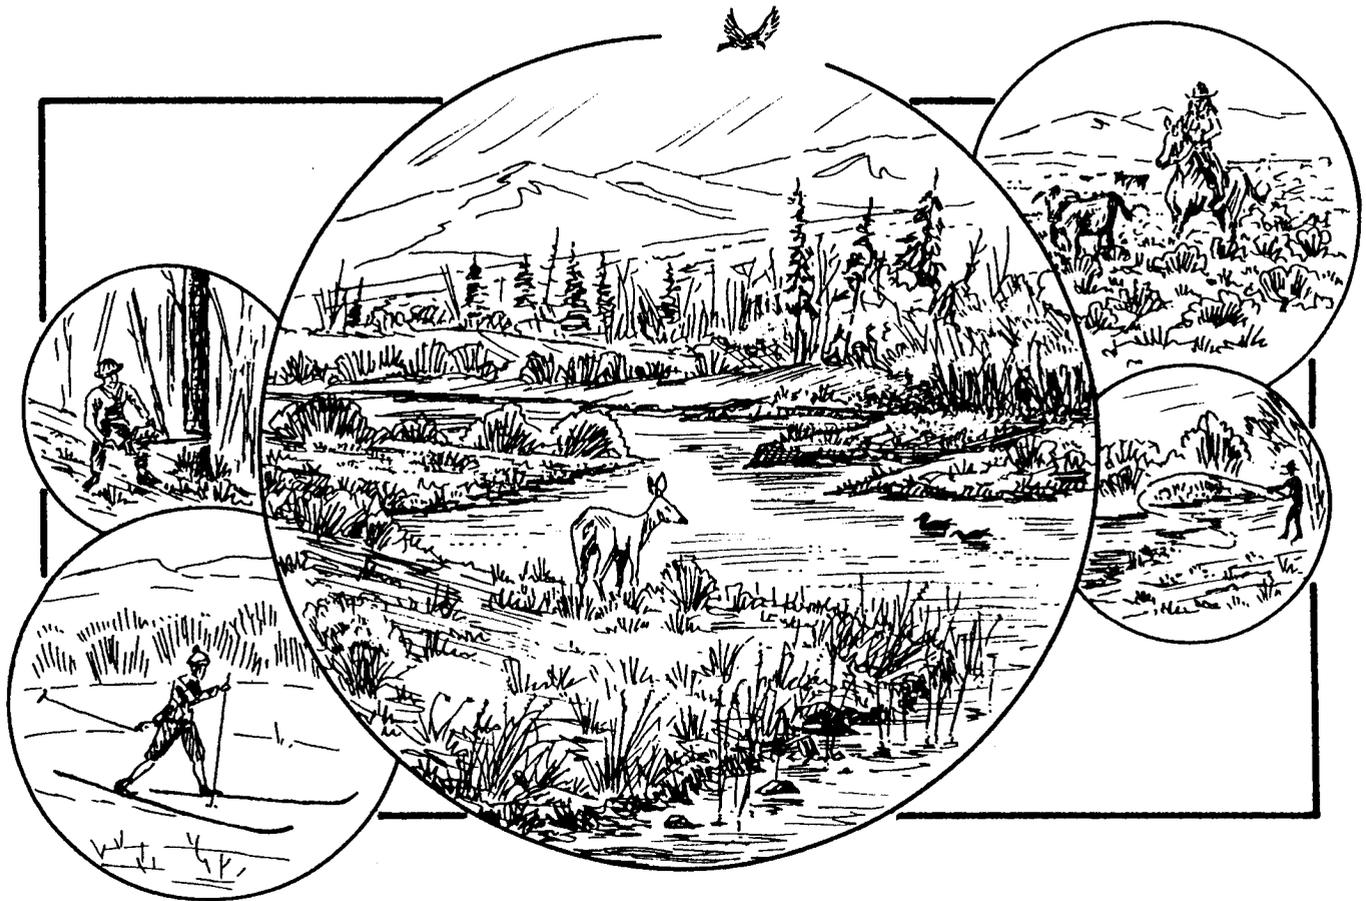

- **Resource Conditions Improved:** PRMP decisions would improve degraded and maintain satisfactory condition riparian and aquatic habitats, with resulting benefits to riparian soils, water quality, fisheries habitat, and riparian-dependent wildlife species. PRMP decisions would also improve the condition of upland vegetation communities, with beneficial impacts to soils, upland watersheds, most wildlife habitats, and wild horse habitat within the Herd Management Area. Decisions related to forest resource management would improve long term sustained productivity and forest health on most sites. Developed recreation opportunities would improve, as would the quality of primitive recreation experiences.
- **Social and Economic Impacts:** The availability and quality of trust resources of importance to Federally recognized tribes would improve. The Fort Hall Indian Reservation's economy and society may be positively affected by increased opportunity for tribal members to utilize resources to provide for personal subsistence, to obtain raw materials (to make value-added products) and to fulfill cultural needs. Within the Custer-Lemhi counties' economy, reductions in some resource and land uses would, over the long term, improve and sustain the condition of resources which support activities related to the regional economy and society. Although the estimated quantitative impacts to the Custer-Lemhi counties' economy would not be significant (less than 1% decrease in sales, earnings, and population), the impacts to individual livestock permittees and subregions dependent on agriculture could be greater, depending on the resource values and conditions within a given allotment.
- **Land Uses Reduced:** Off-highway vehicle use limitations would essentially eliminate off-road vehicle travel throughout the Resource Area. PRMP decisions may result in up to a 25% decrease in estimated annual livestock use, depending on permittees' efforts to manage livestock use and distribution. Restrictions on mineral materials sales may limit the availability of new, easily accessible and low cost mineral material sites to meet public demand.
- **Residual (Unmitigated) Resource Impacts:** The analysis of environmental consequences indicates that cultural resources loss, disturbance, or damage may still occur in localized areas, due to (a) unauthorized collection and vandalism, or (b) land sales/transfers or surface disturbing activities on sites which were not identified during Class III intensive inventories. Some surface disturbing activities, such as road construction or campground development, would cause an irreversible and irretrievable commitment of the soil resource on a localized basis. Primitive values may decline in some portions of WSAs, if released from wilderness review; this loss of values may be irreversible and irretrievable.

## **Challis Proposed Resource Management Plan.**

The following two sections contain the Challis Proposed Resource Management Plan and Attachments. The PRMP identifies the BLM's proposed resource condition objectives, land use allocations, and management actions and direction for guiding resource management of public lands within the Challis Resource Area during the next 15 to 20 years.

# Challis Proposed RMP

## Air Quality

**Goal 1:** Prevent deterioration of air quality by BLM authorized actions within the Challis Resource Area (RA).

**Rationale:** Under the Clean Air Act (as amended in 1977), BLM-administered lands were classified Class II. This classification allows moderate deterioration of air quality with moderate, well controlled population and industrial growth.

1. Mitigation to minimize air quality degradation would be incorporated into project proposals as necessary.
2. Air quality monitoring may be implemented by the BLM where necessary.
3. Burn plans which include incident and cumulative air quality considerations would be developed for all prescribed burn treatments.
4. The BLM would not authorize activities which would be likely to adversely affect the Class II classification of public lands within the Challis RA, or the Class I designations of the Yellowstone or Grand Teton National Parks or the Selway-Bitterroot, Sawtooth, Craters of the Moon, or Red Rock Lakes Wilderness Areas.

---

## Areas of Critical Environmental Concern/Research Natural Areas

**Goal 1:** Maintain and protect important biological, cultural, scenic, and other natural systems or processes by highlighting management of areas containing these resources.

**Rationale:** The Federal Land Policy and Management Act directs the BLM to "protect and prevent irreparable damage to important historic, cultural, scenic, fish, and wildlife resources or other natural systems or processes, and to protect life and safety from natural hazards" through designation of Areas of Critical Environmental Concern (ACECs).

### Management Decisions Common to All ACECs:

1. Require plans of operation for development of any new or existing mining claims.
2. Review any new right-of-way application to see if the proposal would negatively affect the values for which the area was designated. If so, deny the application.
3. Tracts of public land within an ACEC, if identified as available for disposal, may be exchanged for private or State lands within or adjacent to the ACEC, provided the acquired lands are of equal or greater benefit to the integrity and management of the associated ACEC.

4. Develop a land use activity plan to manage ACEC values in coordination with other resource uses and values in the ACEC, unless management would be addressed through an existing activity plan (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103).
5. Encourage studies and research, if consistent with protection of ACEC values.
6. Manage other land uses within the ACEC to reduce or eliminate negative impacts to ACEC values.

*For additional decisions regarding management of ACECs/RNAs, also see Minerals, Goal 1, #5, Goal 2, #4, and Goal 3, #4 (pp. 64-66).*

**Additional Management Decisions, by ACEC:**

***Antelope Flat ACEC/RNA***

*Values:* Unusual plant communities.

*Relevance and Importance:* The plant communities occurring on the Antelope Flat area are uncommon, occurring only in east central Idaho.

1. Retain designation of 588 acres as an Area of Critical Environmental Concern (ACEC) and Research Natural Area (RNA) (see *Map 5: ACECs - Antelope Flat ACEC/ RNA*).
2. Limit motorized vehicle use to existing roads and vehicle ways.

***Birch Creek ACEC***

*Values:* Crucial winter range and lambing habitat for bighorn sheep. Rare plants.

*Relevance and Importance:* The area provides crucial habitat for a remnant herd of approximately 50 bighorn sheep. The area is vulnerable to adverse change due to mineral development, human disturbance from motorized vehicle use, and competition with livestock for forage. Two populations of wavy leaf thelypody, a special status plant species, and one population of Lemhi milkvetch, another rare species, have been found in the area.

1. Designate 8,649 acres as an ACEC (see *Map 6: ACECs - Birch Creek ACEC*).
2. Motorized vehicle use would be prohibited during the winter/spring period between December 16 and April 30, inclusive, and limited to existing roads, vehicle ways, and trails between May 1 and December 15, inclusive.

3. Manage bighorn sheep habitat in the Birch Creek area as described in Wildlife Habitat, Goal 1, #6, p. 95.
4. Pursue acquisition of State lands within the ACEC.
5. Monitor rare plant populations.

***Cronk's Canyon ACEC/RNA***

*Values:* Relict bighorn sheep population; pristine natural plant communities.

*Relevance and Importance:* Yearlong habitat for a small relict bighorn sheep population. Since topographic constraints have precluded livestock use on a portion of the area, this area represents pre-grazing vegetative conditions and functions as an important comparison site.

1. Retain designation of 1,496 acres as an ACEC, of which 366 acres would be managed as an RNA (see *Map 7: ACECs - Cronk's Canyon ACEC/RNA and Dry Gulch ACEC/RNA*).
2. Continue to close the ACEC/RNA to livestock grazing.
3. Monitor plant communities.
4. Continue to close 314 acres of forest land to woodland product sales.
5. Limit motorized vehicle use to existing roads and vehicle ways.

***Donkey Hills ACEC***

*Values:* Crucial elk habitat.

*Relevance and Importance:* Winter range and calving habitat for 850 elk. Regionally significant hunting opportunities. Habitat essential to long term survival and viability of elk populations from several regional IDFG hunt units.

1. Designate 29,706 acres as an ACEC, including approximately 4,714 acres in the Big Butte Resource Area - BLM (see *Map 8: ACECs - Summit Creek ACEC/RNA and Donkey Hills ACEC*).

*Donkey Hills ACEC Management Applying to the Designated Acreage in the Challis Resource Area*

2. Prohibit motorized vehicle use in the Donkey Hills ACEC during the winter/spring period between December 16 and April 30, inclusive, and limit motorized vehicle use to existing roads, vehicle ways, and trails between May 1 and December 15, inclusive. Accommodate access to private lands in the ACEC. See *Map 33: OHV Use*.
3. Consult the IDFG and appropriate Federally recognized tribes about stipulations to protect elk habitat quality prior to authorization of any actions that may affect elk habitat. Timber would be harvested in accordance with the following stipulations, to protect elk habitat quality: (a) timber would be removed by helicopter or cable logging to existing roads only - no new roads would be constructed, (b) Douglas-fir would be harvested by shelterwood or group selection cuts only, (c) clearcuts in lodgepole pine would be 10 acres or smaller, and (d) a 200-foot uncut buffer zone would be left around the edges of all harvest units. Uncut buffer zones may be harvested when cut units have regenerated sufficiently to meet elk habitat requirements.
4. Pursue acquisition of State and private lands in the ACEC, with emphasis on land exchanges and cooperative efforts with conservation organizations such as the Rocky Mountain Elk Foundation.
5. Manage elk habitat in the Donkey Hills area as specified in Wildlife Habitat, Goal 1, #6, p. 95.

*Donkey Hills ACEC Management Applying to the Designated Acreage in the Big Butte Resource Area (Upper Snake River District - BLM) Note: Actions #6 through 12 would amend the Little Lost-Birch Creek MFP (USDI - BLM 1981).*

6. Designate approximately 4,714 acres currently managed by the Big Butte Resource Area - BLM as part of the Donkey Hills ACEC (see *Map 8: ACECs - Summit Creek ACEC/RNA and Donkey Hills ACEC*).
7. Implement management decisions common to all areas designated as ACECs (see pp. 29-30).
8. Aggressively suppress all wildfires in the Donkey Hills area to meet allowable burn acreage as follows: No fires larger than 200 acres based on values at risk. Resource advisors would be consulted on all wildfires. Design wildfire suppression tactics to minimize (a) impacts to visual, vegetative, and other resource values, and (b) expenditures of public funds.

9. Prohibit motorized vehicle travel from December 16 through April 30, and limit motorized vehicle travel the remainder of the year to existing roads and vehicle ways. Temporary exceptions to this limitation (e.g., travel off-road to retrieve downed big game, cut firewood, access a campsite, park, turn around, pass another vehicle, or for emergency purposes) would be authorized as specified in Off-highway Vehicle Use, Goal 1, #1b and 1c (p. 69).
10. Participate with Challis Resource Area staff in development of a joint land use activity plan to manage elk habitat values in coordination with other resource uses and values in the ACEC (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103).
11. Pursue acquisition of State and private lands in the ACEC, with emphasis on land exchanges and cooperative efforts with conservation organizations such as the Rocky Mountain Elk Foundation.
12. Continue to defer timber harvest in the Donkey Hills area because conventional logging is not possible, due to the terrain (adverse impacts on resource values), and helicopter logging is economically unfeasible. Should timber harvest by helicopter logging become economically feasible, apply the following stipulations to protect elk habitat quality: (a) timber would be removed by helicopter logging to existing roads only - no new roads would be constructed; (b) Douglas-fir would be harvested by shelterwood or group selection cuts only; (c) clearcuts in lodgepole pine would be 10 acres or smaller; and (d) a 200-foot uncut buffer zone would be left around the edges of all harvest units.

#### ***Dry Gulch ACEC/RNA***

*Values:* Unusual plant communities; several rare plant populations.

*Relevance and Importance:* This area contains the most northern known populations of three rare Challis endemic plant species. Protecting populations on the fringe of the species' distribution is important in protecting the genetic diversity of the species.

1. Designate 539 acres as an ACEC/RNA (see *Map 7: ACECs - Cronk's Canyon ACEC/RNA and Dry Gulch ACEC/RNA*).
2. Fence and maintain the northwestern spring as a natural spring (undeveloped) .
3. Maintain current slope conditions in habitat areas of sensitive plant species.
4. Limit motorized vehicle use to the existing boundary roads.
5. Monitor plant populations.

***East Fork Salmon River Bench ACEC/RNA***

*Values:* Remnant pristine vegetation.

*Relevance and Importance:* Although this site is small, it has a variety of plant communities in pristine condition. Livestock have been precluded from using this area because of topographic constraints. Thus, this area represents pre-grazing condition and functions as an important comparison site.

1. Retain designation of 78 acres as an ACEC/RNA (see *Map 9: ACECs - East Fork Salmon River Bench ACEC/RNA*).
2. Continue to close the area to livestock grazing.
3. Monitor plant communities.
4. Close the ACEC/RNA to motorized vehicle use.

***Herd Creek Watershed ACEC/RNA***

*Values:* Riparian recovery and demonstration area; presence of rare plants; variety of high elevation range and forest plant communities; known spawning and rearing habitat for special status steelhead trout, bull trout, and chinook salmon; roadless/primitive and scenic values.

*Relevance and Importance:* Approximately one mile of public land on lower Herd Creek has been fenced since 1980 as a recovery, demonstration, and control area for riparian management. Three populations of wavy leaf thelypody are known to occur in the Herd Creek watershed, the most southern edge of the species' range. The peripheral location and the range of occupied habitats make this an important area to protect and manage for the species' genetic diversity. The upper Lake Creek area also contains most of the forest habitat types common to central Idaho, as well as several range site types. A diversity of aspect and elevations within a small area create a diversity of communities, thus capturing a representation of much of the biodiversity of the Resource Area. Herd Creek is designated critical habitat for chinook salmon and important habitat for bull trout. Historically, the stream contributed more than 30% of the East Fork Salmon River's production of chinook salmon. The watershed is a wilderness study area (the Jerry Peak WSA) because of its naturalness, roadlessness, and outstanding scenic values.

1. Designate 17,943 acres as an ACEC, of which 1,055 acres would be retained as an RNA (formerly known as the Lake Creek ACEC/RNA) (see *Map 10: ACECs - Herd Creek Watershed ACEC/RNA*).
2. Maintain the existing riparian enclosure on lower Herd Creek and explore options for enlarging the enclosure.

3. Improve riparian areas along Lake Creek to proper functioning condition within 5 years (see *Attachment 1*, pp. 101-102).
4. Maintain current slope conditions in habitat areas of the wavy leaf thelypody.
5. Monitor high elevation range and forest plant communities in the upper Lake Creek area.
6. Continue to withdraw 57 acres of suitable commercial forest land in the upper Lake Creek area (T9N, R20E) from the commercial timber base. Also see management of the Jerry Peak WSA, if released from wilderness review, described in Forest Resources, Goal 1, #23, p. 52.
7. Continue to close 948 acres of forest land in the upper Lake Creek area (T9N, R20E) to woodland product sales.
8. Manage the Herd Creek watershed to reduce sediment delivery to spawning areas along Herd Creek and the East Fork Salmon River.
9. Designate the existing trail below Herd Lake and road above Herd Lake "closed" to motorized vehicle use; maintain these routes as trails for non-motorized use only. Limit motorized vehicle use in the remainder of the Herd Creek Watershed ACEC/RNA to existing roads and vehicle ways (see *Map 33: OHV Use*).

### ***Lone Bird ACEC***

*Values:* Numerous and unique cultural resources. Rare plants.

*Relevance and Importance:* The area contains a number of prehistoric sites, identified quarry sites, and excellent flakable material. Many of the prehistoric sites have evidence of deeply stratified cultural deposits and several are listed on the National Register of Historic Places. The prehistoric sites are threatened by intensive erosion, vandalism, and destructive casual use. The area is also of local and regional significance to the Shoshone-Bannock Tribes for its socio-cultural values. One population of wavy leaf thelypody, a special status plant species, and populations of two other Challis endemic plant species are found in the area.

1. Designate 9,969 acres as an ACEC (see *Map 11: ACECs - Lone Bird ACEC*).
2. Retain the existing road closure and physically close the existing road from the NE 1/4, NE 1/4 Section 13, T12N R19E to the NW 1/4, SE 1/4 Section 19, T12N R20E to prevent unauthorized use. The remainder of the ACEC would also be signed and closed to motorized vehicle use.
3. Develop management to protect cultural values.

4. Monitor populations of rare plants.
5. Close the Lone Bird ACEC to rockhounding, collection of mineral materials, and mineral material sales.

***Malm Gulch/Germer Basin ACEC/RNA***

*Values:* Concentration of rare plants; unusual plant communities; petrified forest; fragile soils.

*Relevance and Importance:* The Malm Gulch/Germer Basin area contains a high concentration of rare Challis endemic plant species. The paleontological values are regionally unique. Most of the area contains fragile soils that require special management consideration.

1. Retain designation of 7,823 acres as an ACEC, of which 2,643 acres would be retained as an RNA (see *Map 12: ACECs - Malm Gulch/Germer Basin ACEC/RNA*).
2. Continue to close the area to livestock grazing, except for a semi-annual one-day trailing permit.
3. Monitor wild horse use in Malm Gulch, and remove wild horses as necessary to protect the fragile watershed.
4. To reduce the hazard of erosion, limit motorized vehicle use in the ACEC to the existing road from Highway 93 to a point of closure in the NW 1/4 of Section 28, T12N, R19E.
5. Continue to withdraw 270 acres of commercial forest land from the commercial timber base.
6. Continue to close 1,136 acres of non-commercial forest land to woodland product sales.
7. Close the area to rockhounding, collection of mineral materials, and mineral material sales.
8. Monitor plant communities.
9. Provide a wayside along Highway 93 to interpret paleontological values and promote their preservation. Protect significant paleontological localities by not identifying their specific location or otherwise promoting public use of the resource.

***Peck's Canyon ACEC/RNA***

*Values:* Excellent condition plant communities.

*Relevance and Importance:* The area contains a large mountain mahogany stand in excellent condition. Due to the steep topography of the area, most of the other plant communities in this ACEC are also in excellent condition.

1. Retain designation of 782 acres as an ACEC/RNA (see *Map 13: ACECs - Peck's Canyon ACEC/RNA*).
2. Completely inventory the ACEC for rare plants.
3. Monitor plant communities.
4. Limit motorized vehicle use to existing roads and vehicle ways.

***Pennal Gulch ACEC***

*Values:* Rare plants; unique riparian area; unique and representative vegetation.

*Relevance and Importance:* Populations of the wavy leaf thelypody in the Pennal Gulch area are representative of those found in the north central portion of the species' range. The Pennal Gulch area contains four known population areas of this species, and habitat for additional populations. An unusual cottonwood community with a unique understory composition is present along a portion of the drainage channel. The area also contains many of the Challis endemic sensitive plant species, typical Challis area plant communities, and unusual associations containing rare plant species.

1. Designate 5,832 acres as an ACEC (see *Map 14: ACECs - Pennal Gulch ACEC*).
2. Limit motorized vehicle use to the existing road.
3. Monitor populations of rare plants.

***Sand Hollow ACEC/RNA***

*Values:* Fragile watershed, rare plant populations; geological area of interest.

*Relevance and Importance:* Soils in the Sand Hollow area are fragile and require special management consideration. The area contains a concentration of Challis endemic rare plant species. At the upper end of the Sand Hollow area are the Paint Pots, a regionally significant area that provides excellent representation of the Challis volcanics.

1. Designate 3,332 acres as an ACEC/RNA (see *Map 15: ACECs - Sand Hollow ACEC/RNA*).
2. Monitor populations of rare plants.
3. Continue to close the Sand Hollow watershed to livestock grazing and motorized vehicle use (see *Map 27: Grazing Closures* and *Map 33: OHV Use*).
4. Monitor wild horse use in the Sand Hollow watershed, and remove wild horses as necessary to protect the fragile watershed.

#### ***Summit Creek ACEC/RNA***

*Values:* Unique wetland system, rare plants, special recreation values.

*Relevance and Importance:* This wetland system contains unique plant communities and associated rare species. The alkaline primrose, a special status plant species, is found in only two other locations administered by the Challis and Lemhi Resource Areas. Other plant species on the site are very rare within Idaho. The site also has values for waterfowl, fishing, and recreation. As the oldest riparian enclosure in the Resource Area, the Summit Creek RNA is of important scientific value. The site has served as a research site for several studies.

1. Retain designation of 304 acres as an ACEC, of which 230 acres would be an RNA (see *Map 8: ACECs - Summit Creek ACEC/RNA and Donkey Hills ACEC*).
2. Limit motorized vehicle use in the Summit Creek ACEC/RNA to the Howe-May road, the area south of the existing campground road, and the access route to Barney Hot Springs.
3. To mitigate impacts on special status plant species, move the Summit Creek campground facilities to the southwest side of the existing campground road. The creek and riparian area would be fenced and closed to camping and vehicle traffic, and signs would explain the reasons for the closures.
4. Encourage continued use of the area for research.
5. Develop an interpretive display identifying the unique values of the area to recreationists and explaining restrictions on use.
6. Close the ACEC to livestock grazing, and maintain fencing to exclude livestock.
7. Maintain or increase the size of occupied population areas of the five known special status plant species. Monitor populations.

8. Continue to allow noxious weed control in and around the enclosure area. Any weed control program would be done in a manner that would protect rare plant species.

### ***Thousand Springs ACEC/RNA***

*Values:* Unique wetland ecosystem; high value for waterfowl.

*Relevance and Importance:* This wetland system is unique in its plant communities, hydrology, and the habitat associated with these features. It contains regionally significant waterfowl values.

1. Retain designation of 843 acres as an ACEC, of which 233 acres would be an RNA. The isolated tract on the south side of the Trail Creek Road (53 acres) would no longer be part of the ACEC and would be identified for potential exchange for lands with comparable resource values that would enhance the integrity of the ACEC. Designate an additional 322 acres of recently acquired lands as part of the ACEC, for a total of 1,165 acres in the ACEC. (See *Map 16: ACECs - Thousand Springs ACEC/RNA*).
2. Monitor plant communities.
3. Continue to manage the ACEC in accordance with the current Chilly Slough Wetland Conservation Project Plan (see *Attachment 11*, p. 144) and the current Thousand Springs/ Chilly Slough HMP. These plans may be updated or revised as necessary (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103). Adjacent private lands with wetland values may be acquired from willing sellers, if available.
4. Livestock use may be authorized after resource objectives have been met, if agreed upon by all members of the Chilly Slough Working Group (see *Attachment 11*, p. 144). Fences would be built in cooperation with adjacent private landowners, to control livestock use on all areas of the ACEC.
5. Condemnation authority would not be used to acquire access across private lands to any part of the ACEC.
6. Limit motorized vehicle travel to existing (and newly constructed, if applicable) roads, vehicle ways, trails, and parking areas (see *Glossary: existing roads, vehicle ways, and trails*, p. 172).

*For additional decisions regarding management of the Chilly Slough Wetlands Conservation Project Area, also see Recreation Opportunities and Visitor Use, Goal 1, #16, p. 76.*

## Biological Diversity

**Goal 1:** Maintain functional and repair non-functional ecological systems and processes to ensure continued sustained production of ecosystem products and values such as forage, timber, clean water, and wildlife and fisheries habitat.

**Rationale:** The long term ability of the ecosystem to provide products for human use and enjoyment requires maintenance of biological diversity at several scales: genetic, species, community, and landscape (see *Glossary: biological diversity*, p. 168). Management decisions to improve range and riparian condition are critical to the genetic, species, and community components of this goal, but are not reiterated here (see actions listed under the following sections of the PRMP: Fisheries, Floodplain/Wetland Areas, Livestock Grazing, Rangeland Vegetation Treatment Projects, Riparian Areas, Special Status Species, Upland Watershed, Water Quality, Wildlife Habitat). Pattern and processes at scales higher than communities (watershed, mountain ranges, regions) affect the dispersal, migration, and long term viability of organisms and the long term sustainable functioning of the natural ecosystem.

1. Include an analysis of direct, indirect, and cumulative effects to biodiversity as part of project and activity planning. The assessment would include, but is not limited to, the following: special status species; unusual or unique plant associations; potential natural, pristine, or good condition communities; important habitat for wildlife; and unique and important landscape patterns. Diversity would be assessed at the species, community, and landscape levels. Incorporate additional guidance as it becomes available.
2. Participate in the BLM's neotropical migratory bird project.
3. Assess patterns of diversity for wide-ranging species (e.g., wolves, bald eagles, golden eagles, goshawks, black bear, elk) in the Resource Area's ecosystems by identifying and mapping (a) areas of fragmented habitat, barriers, and important dispersal corridors, (b) areas of non-fragmented blocks of important habitat, and (c) areas affected by landscape level processes (e.g., fire, insect infestations, blow-downs). (See *Glossary* definitions: barrier, dispersal corridor, fragmented, landscape level processes; pp. 167, 170, 173, 175.)
4. Identify key ecosystem indicator species (see *Glossary*, p. 175) that require ecosystem level management.
5. During activity planning (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103), develop (a) ecosystem and biodiversity objectives, and (b) management strategies to meet the requirements for key ecosystem indicator species.
6. Develop cooperative projects with agencies and private landowners to assess and manage diversity at the landscape level across agency boundaries. Pursue partnerships with adjacent Federal agencies to develop regional goals for biodiversity management.

*For additional RMP decisions regarding management of unique or representative biological resources, also see Areas of Critical Environmental Concern, Goal 1, pp. 29-39.*

## Cultural Resources

**Goal 1:** Identify and manage cultural resources for a variety of values, including information potential, public values, and conservation.

**Rationale:** Cultural resource management responds directly to the National Historic Preservation Act of 1966, as amended, the Archaeological Resources Protection Act of 1979, as amended, and in general to the Federal Land Policy and Management Act. The BLM's **Adventures in the Past** initiative (1990) (see *Glossary*, p. 166) promotes the preservation of public land resources and encourages scientific study through research projects which have management benefits.

1. Within two years develop a cultural resource overview of all cultural resources identified within the Challis Resource Area.
2. When conducting a watershed assessment or when developing or revising activity plans (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103), fully integrate cultural resources by (a) taking into consideration the effects of all management actions within that planning area on cultural resources; and (b) providing opportunities to manage cultural resources independent from non-cultural resource related activities.
3. Provide a level of inventory which is commensurate with the level of activities/impacts that result from activity or project planning.
4. Continue monitoring and management of cultural resources. Update site information on those sites recorded prior to development of the IMACS (Intermountain Antiquities Computer System) survey form.
5. Conduct data recovery or stabilization at critically threatened sites (in imminent danger of destruction or damage) of high scientific value.
6. Retain public lands containing cultural resources eligible to be listed in, or listed in, the National Register of Historic Places (NRHP) (see *Glossary*, p. 176) on a case-by-case basis.
7. Continue the current use allocation of the Doublesprings Area for scientific use.
8. Close the Lone Bird ACEC to rockhounding, mineral material collection, and mineral material sales.
9. Manage OHV use as follows, in order to protect cultural resources (see *Map 33: OHV Use*):
  - (a) Close the Lone Bird ACEC to motorized vehicle use. Physically close the existing road in the Lone Bird ACEC from the NE 1/4, NE 1/4, Section 13, T12N R19E to the NW 1/4, SE 1/4, Section 19, T12N R20E to prevent unauthorized use. (See *Map 11: ACECs - Lone Bird ACEC*.)

- (b) Physically close approximately 1/2-mile of the Devil Canyon Road to help prevent vandalism of cultural resources.
  - (c) To protect cultural resources and for safety reasons, limit motorized vehicle travel on the Shay Line Trestle to vehicles with a 50-inch wheel base or less and weighing 1,500 pounds or less.
  - (d) Limit motorized vehicle use in the Antelope Flat area to existing roads and vehicle ways yearlong.
10. Conduct a minimum of 500 acres of Class III non-project intensive inventory (see *Glossary*: cultural resource inventory classes, p. 169) annually in areas with high potential for cultural resources.
  11. Prepare a patrol and surveillance plan within one year of RMP approval, for monitoring and law enforcement purposes.
  12. Areas of known concentrations of human burials would be closed to livestock grazing, withdrawn from locatable mineral entry and mineral material disposal, and stipulated no surface occupancy for the purposes of energy and non-energy leasing. All areas containing Native American burial areas would be retained in public ownership.
  13. Conduct a comprehensive study of rock art locations, including completion of data records, scale drawings, photographs, and descriptions.
  14. Develop management practices to protect cultural values in the Lone Bird area.

**Goal 2:** Increase public awareness, understanding, and appreciation of the significance and value of cultural resources.

**Rationale:** Public education and outreach promoting sound cultural resource management and protection will help decrease instances of vandalism as well as enhance public access to cultural resources. Public awareness activities are required through amendment to the Archaeological Resources Protection Act of 1979.

1. Manage interpretive efforts consistent with State and Federal law, protecting cultural resources from adverse impacts associated with interpretive sites and providing for data recovery.
2. Develop interpretive materials for cultural resources including, but not limited to, the following: Shay Line Trestle, Crystal Townsite, Challis Bison Jump, and Salmon River sites.
3. Participate in the BLM's Heritage Education program (see *Glossary*, p. 174).

4. Participate in Adventures in the Past (see *Glossary*, p. 166) initiatives to increase public awareness of the significance of and need to protect cultural resources located on public lands.

**Goal 3:** Identify and manage cultural resources with high Native American traditional cultural value.

**Rationale:** The BLM provides for management of cultural resources in consultation with Native American groups. The National Environmental Policy Act, the Federal Land Policy and Management Act, the American Indian Religious Freedom Act, the Archaeological Resources Protection Act, and the Native American Graves Protection and Repatriation Act (see *Appendix E, Item 1*, pp. 638-643) provide legal requirements for coordination with Native American groups and regarding cultural resources management.

1. Coordinate with appropriate Native American groups on cultural resource values.
2. Conduct and complete an ethnographic inventory project by FY 2005 to document current and historic traditional cultural use by Native American groups.

---

## Fire Management

**Goal 1:** Protect human life, property, and valuable resources from wildfire, and reduce the impacts of suppression activities. Use prescribed fire to protect property and valuable resources, improve range and timber resource conditions, and perpetuate the natural ecosystem.

**Rationale:** Wildfire can be a threat or a tool, depending on the potential for effects on human life, property, and resources. Unless carefully managed, suppression activities can cause greater and longer-lasting impacts on life, property, and resources than fire. Fire management guidance is provided in an annual fire management activity plan.

1. Provide initial attack and full suppression of natural and human-caused wildfires to protect life, property, and high value resources in the areas identified on *Map 23: Fire Control*.
2. Develop activity plans (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103) to direct fire suppression on a site-specific basis within the conditional suppression areas identified on *Map 23: Fire Control*. In the absence of an activity plan, provide initial attack and full suppression of natural and human-caused wildfires occurring within conditional suppression areas.
3. Design wildfire suppression tactics to minimize (a) impacts to visual, vegetative, and other resource values, and (b) expenditures of public funds.
4. Fully suppress all wildfires within mountain mahogany vegetation types to retain important bighorn sheep and other wildlife habitat. The areas supporting large blocks of this vegetation type are included as full suppression areas on *Map 23: Fire Control*.

5. When conducting fire management planning, or suppressing, controlling, or otherwise managing a wildfire or prescribed fire, design fuel treatment and fire suppression/control strategies, practices, and activities to accomplish the following objectives:
  - (a) ensure progress toward the riparian and aquatic habitat conditions described in *Attachment 15* (see p. 149);
  - (b) be in accordance with fire management-related SOPs (see *Attachment 5*, pp. 107-112) and suppression/rehabilitation specifications (see *Attachment 9*, pp. 124-134);
  - (c) protect natural resources, consistent with other decisions in this RMP, by adhering to the following:
    - (1) use motorized fire fighting equipment in accordance with the decisions listed in OHV Use, Goal 1, #1a and b, and #2-7, pp. 69-71, to the extent possible. As noted in OHV Use, Goal 1, #1c, temporary exceptions to the listed OHV limitations and closures may be granted.
    - (2) in Special Management Areas (see *Glossary*, pp 182-183), in areas of fragile soils, on slopes greater than 35%, and on slopes adjacent to (within 1/8-mile of) water courses, limit the use of heavy equipment in construction of fire lines to protection of property and facilities, important wildlife habitat, known cultural/historic resources, and high value timber.
    - (3) avoid retardant applications and fuel storage within 1/8-mile of riparian areas or within designated recreation sites.
    - (4) do not use tractors or other heavy motorized equipment within riparian habitats.

Under situations threatening life or property, these restrictions may be lifted by the authorized officer.

6. Fire management actions would be in accordance with "Minimum Impact Suppression Tactics" (USDA Forest Service - Northern Region 1993, or as revised) or similar fire suppression guidance (see *Attachment 9: Fire Suppression and Rehabilitation Specifications*, pp. 124-134). Locate incident bases, camps, helibases, staging areas, helispots, and other centers for incident activities outside of riparian areas (as defined in *Attachment 4*, pp. 105-106), unless a review and recommendation is made by a qualified resource advisor assigned to the incident. If the site of incident activity is located within riparian habitats (as defined in *Attachment 4*), fire activities should not hinder progress toward attaining desired riparian and aquatic habitat conditions (see *Attachment 15*, p. 149). During pre-suppression planning, utilize an ID team to predetermine suitable incident base and helibase locations sufficient to support major incidents.

7. Within conditional suppression areas, determine where resource management objectives would be met through the use of prescribed fire to enhance ecosystem health and function and biodiversity. Develop activity plans and fire prescriptions for these areas through an ID team planning process (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, pp. 103). For prescribed fire proposals in areas where cheatgrass invasion is potentially high, the ID team would physically examine the site to specifically analyze the risk of cheatgrass invasion prior to finalizing the project proposal.
8. Whenever riparian habitats within areas defined in *Attachment 4* (pp. 105-106) are significantly damaged by wildfire or prescribed burning, form an emergency ID team to develop a rehabilitation plan that will ensure progress toward the riparian and aquatic habitat conditions described in *Attachment 15* (see p. 149, and ensure that the fire rehabilitation specifications listed in *Attachment 9*, pp. 124-134, are followed. Address all other fire rehabilitation on a case-by-case basis (also see Upland Watershed, Goal 1, #8, p. 88).

---

## Fisheries

**Goal 1:** Ensure a natural abundance and diversity of aquatic habitats to support fisheries resources in a healthy and productive condition, to provide the continued opportunity for nonconsumptive and consumptive uses, and to ensure the viability of these species.

**Rationale:** The BLM is responsible for management of fish habitat on the Challis Resource Area's public lands to ensure that self-sustaining, healthy populations can be maintained. The Salmon BLM's *Fish and Wildlife 2000 Plan* (1993) provides guidance for management of fish habitat.

### Management Decisions Common to All Fisheries Resources:

1. The following would be priority fish species (see *Glossary*, p. 179):

#### Anadromous Fish Species:

Chinook Salmon	<i>(Oncorhynchus tshawytscha)</i>
Sockeye Salmon	<i>(Oncorhynchus nerka)</i>
Steelhead Rainbow Trout	<i>(Oncorhynchus mykiss)</i>

#### Resident Fish Species:

Bull Trout	<i>(Salvelinus confluentus)</i>
Westslope Cutthroat Trout	<i>(Oncorhynchus clarki lewisii)</i>
Brook Trout	<i>(Salvelinus fontinalis)</i>
Rainbow Trout	<i>(Oncorhynchus mykiss)</i>
Mountain Whitefish	<i>(Prosopium williamsoni)</i>

2. Define crucial habitats for priority fish species to include migration, spawning, rearing, and overwintering habitats.
3. Identify and monitor crucial habitats and determine distribution of priority fish species within the RA, with special emphasis on drainages within watersheds currently sustaining special status fish populations.
4. (a) For all fish-bearing streams (see *Map 2: Anadromous and Resident Fisheries Occupied Habitat*), develop management strategies and objectives through the ID team process, to maintain satisfactory condition aquatic and riparian habitats and improve 90% of nonfunctional and functional-at-risk condition aquatic and riparian habitats within riparian areas defined in *Attachment 4*, pp. 105-106 (also see *Attachment 1: Riparian-Wetland Area Function Classification*, pp. 101-102).  
  
(b) Develop strategies, through the ID team process, to meet or exceed the minimum riparian and aquatic habitat conditions described in *Attachment 15*, p. 149.
5. Authorize population enhancement activities for priority fish species through introduction of hatchery-reared fish, only when it can be documented that the population levels and the genetic integrity of endemic wild anadromous stocks or other resident fish populations will not be adversely impacted.
6. Provide opportunity and support to the IDFG, NMFS, USFWS, USFS, BPA, appropriate Federally recognized tribes, and other partners for the cooperative management of anadromous and resident fish resources in order to promote fisheries opportunities on BLM-administered public lands, while ensuring protection of priority salmonid fish resources.
7. Maintain a "no net loss" of salmon, steelhead trout, and bull trout habitat by limiting land exchanges of salmon, steelhead trout, and bull trout habitat to like habitat of equal or greater values. Riparian, wetland, and floodplain habitat could be exchanged, but only for areas containing riparian, wetland, or floodplain habitat with equal or greater values for recreation, access, wildlife, fisheries, and biodiversity. Such exchanges would have to balance similar resource values for each individual exchange, although both tracts of land would not have to be within the boundaries of the Challis Resource Area. Where possible, land exchanges would be made to facilitate recovery of threatened or endangered species.
8. Maintain the existing riparian habitat protective exclosures on Burnt Creek, Herd Creek, Road Creek, and Corral Basin Creek as reference areas to monitor and evaluate aquatic habitat conditions.
9. Where feasible on BLM public lands, within 7 years eliminate or modify natural or artificial barriers to upstream and downstream movement of priority fish species, where it will not impact other authorized or licensed uses (ditches or diversions).
10. In cooperation with the IDFG, seek adequate streamflows for channel maintenance and to sustain riparian habitat and priority fish populations on BLM-administered streams (see *Minimum Streamflow*, Goal 1, p. 67).

11. On a case-by-case basis, coordinate with appropriate Federally recognized tribes on fisheries management actions that may affect tribal treaty rights. Give priority consideration in the development of activity plans and improvement projects to provide benefits to fish species traditionally used for subsistence and non-subsistence purposes by Native American groups under treaty.

Management Decisions Common to Anadromous Fisheries Resources:

12. In cooperation with appropriate parties, inventory anadromous fish habitat on a watershed basis and determine current distribution of anadromous fish species within RA public lands. Watersheds include the East Fork Salmon River and its tributaries Herd Creek, Road Creek, and Big Boulder Creek; the Pahsimeroi River; and the Main Salmon River and its tributaries Morgan, Squaw, Cow, Bayhorse, Thompson, and Challis creeks.
13. Cooperate with the IDFG and appropriate Federally recognized tribes to reduce juvenile anadromous fish mortality due to stream diversion actions (also see Floodplain/Wetland Areas, Goal 2, #4, p. 48). Priority streams include the Main Salmon River, East Fork Salmon River, and the following creeks: Bayhorse, Challis, Eddy, Garden, Cow, Little Morgan, Lyon, McDonald, McKim, Morgan, Squaw, Fox, Thompson, Herd, Lake, and Road.

Management Decisions Common to Resident Fisheries Resources:

14. Within 7 years, develop and implement an activity plan for maintaining and enhancing fisheries habitat along the Big Lost River within the 5.7 miles of public lands extending from the USFS boundary downstream (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103).
15. In cooperation with the IDFG and appropriate Federally recognized tribes, evaluate the potential for re-introducing beaver into historic ranges to promote fish habitat; re-introduce beaver where appropriate (see *Wildlife Habitat*, Goal 4, p. 98).
16. In cooperation with appropriate parties, inventory bull trout and westslope cutthroat trout habitat on a watershed basis and determine the current distribution of bull trout and westslope cutthroat trout within RA public lands.

*For additional RMP decisions which relate to fisheries habitat protection and/or management, also see Minerals, Goal 1, #6, Goal 2, #6, and Goal 3, #5 (pp. 64 and 66); Attachment 5: Standard Operating Procedures, pp. 107-112; and Attachment 8: Design Specifications, pp. 120-123.*

## Floodplain/Wetland Areas

**Goal 1:** Maintain or improve the unique resource values of wetland and floodplain areas.

**Rationale:** Non-riverine wetland areas in the Resource Area are rare, limited to Summit Creek, Thousand Springs, and smaller spring-related wetlands. These areas provide important habitat for wildlife and unusual plants and plant communities.

1. Continue to implement the Chilly Slough wetland conservation project, as described in *Attachment 11: Summary of the Chilly Slough Wetland Conservation Project*, p. 144. (Also see Land Tenure and Access, Goal 1, #6, p. 54.)
2. Move the Summit Creek Campground campsites from the riparian area to the southwest side of the existing campground road to reduce impacts to wetland and rare plant values (see Special Status Species, Goal 2, p. 83).
3. Actions which would have direct or indirect adverse effects on floodplains or wetlands would not be authorized, in accordance with applicable Executive Orders.
4. Retain public lands under BLM administration unless the receiving parties agree to continue to maintain or to restore (if degraded) and permanently maintain floodplain and wetland functions.

**Goal 2:** Prevent loss of the resource values of springs and seeps which may occur through dewatering by spring development or trampling damage by livestock.

**Rationale:** Upland wetland sites provide valuable habitat for wildlife, fish, and plants, and help maintain secure and stable water supplies.

1. Waterholes developed from springs or seeps would normally be converted to headbox/pipeline/trough developments when reconstructed, rather than maintained as waterholes, unless constrained by other resource values. No new waterholes would be developed by blasting or excavation of springs or seeps.
2. New springs and seeps would be developed through headbox/pipeline construction and engineered to maintain water at the spring site (see *Attachment 8: Design Specifications - Rangeland Improvement*, #4 and 8, p. 123). Only those spring sources with an excess of water, as evidenced by surface flow from the site, would be developed. Moist sites, without water flowing from the site, would not be developed to extract water from the site.
3. Consistent with Idaho water laws, the BLM would take those actions necessary to protect Federal water interests on public lands. As much as possible, water being put to beneficial use on BLM lands would not be allowed to be licensed by private claimants.

4. New rights-of-way for water to be diverted from public land by a private claimant would only be granted if (a) the diversion facility is controllable, measurable, and/or designed to divert, at most, that amount of water permitted in the water right, and (b) the diversion would have no significant impact on existing resource values, and (c) granting the right-of-way would not adversely affect achievement of riparian management or aquatic objectives, and (d) when appropriate, the diversion facility is designed and constructed in accordance with the latest fish screening and bypass criteria. When renewing existing rights-of-way for water diversion, stipulate the renewed right-of-way to achieve (a), (b), (c) and (d) above, to the extent possible.
- 

## Forest Resources

**Goal 1:** Maintain the sustainable productivity of forest land by managing forests with an ecosystem approach.

**Rationale:** Recent emphasis in BLM policy is to manage forests as functional ecosystems that provide a sustained yield of ecosystem products such as clean water and wildlife habitat, as well as a sustained yield of forest products. FLPMA requires "a combination of balanced and diverse resource uses that takes into account the long-term needs of future generations." The BLM Public Domain Forest Policy Statement requires the BLM to "manage to maintain desired forest ecosystems."

1. Intensively manage 23,578 acres of commercial forest lands for multiple uses such as timber production, fish and wildlife habitat, and water quality enhancement (see *Map C: Suitable Commercial Timberlands*). Timber harvested per decade in the Challis Resource Area would not exceed the sustained yield average of 6.60 million board feet (MMBF).

Continue to withdraw the following suitable commercial forest lands from the commercial timber base:

- (a) 57 acres in the upper Lake Creek area (T9N, R20E within the Herd Creek Watershed ACEC/RNA); and
- (b) 270 acres in the Malm Gulch/Germer Basin ACEC.

In addition, withdraw the following suitable commercial forest lands from the commercial timber base:

- (a) 6,209 acres in existing Wilderness Study Areas (**Note:** about 2,787 acres in the suitable portions of the Jerry Peak WSA would continue to be withdrawn from the commercial timber base if the WSA is released from wilderness review (see Forest Resources, Goal 1, #23, p. 52)); and
- (b) about 980 acres in small, isolated forest stands (see Forest Resources, Goal 1, #22, p. 52).

2. Conduct an intensive forest inventory within 10 years; include old growth timber stands in this inventory. Adjust the maximum sustained yield harvest per decade based on growth and yield data resulting from this inventory.
3. Manage 22,205 acres of woodland for forest ecosystem values, wood products, and recreational uses (see *Map D: Forest Lands*). Continue to close the following areas to woodland product sales (see Glossary, p. 188):
  - (a) 948 acres of forest land in the upper Lake Creek area of the Herd Creek Watershed ACEC/RNA (T9N, R20E);
  - (b) 1,136 acres of non-commercial forest land in the Malm Gulch/Germer Basin ACEC;
  - (c) 314 acres of forest land in the Cronk's Canyon ACEC; and
  - (d) 9,769 acres of forest land in existing WSAs (includes 3,560 acres of woodland and 6,209 acres of commercial forest land). **Note:** Woodlands would be open to forest management, including woodland product sales, in any WSAs which are released from wilderness review, except where the ACEC closure stated in (a) above would apply.
4. All forest management planning and projects would be designed and analyzed by an interdisciplinary team.
5. Lodgepole pine stands would be harvested primarily by clearcutting. Clearcuts would be limited to 40 acres, except in the Donkey Hills ACEC, where clearcuts in lodgepole pine stands would be limited to 10 acres (see ACECs, Donkey Hills ACEC, #3, p. 32). Clearcuts would also be irregularly shaped to minimize wildlife escape distances and blend into the surrounding landscape.
6. Restrict clearcutting in Douglas-fir types as follows: (a) The need for and size limits of clearcuts for fire salvage would be analyzed by an interdisciplinary team; otherwise, (b) clearcuts would be limited to 10 acres, irregularly shaped to minimize wildlife escape distances and blend into the surrounding landscape, and only allowed for the purpose of controlling dwarf mistletoe infections and insect infestations or for other (non-fire) salvage purposes.
7. In Douglas-fir stands, design timber marking prescriptions to establish or enhance natural regeneration.
8. Natural regeneration would be the primary method of reforestation, except where an area has been heavily affected or depleted by insects, disease, fire, or other natural catastrophes.
9. Artificial regeneration would be completed with seedlings appropriate by seed zone, species, and elevation of site. Plantings would use genetically diverse stock.

10. If natural regeneration does not occur within five years after harvest in clearcut areas and within 15 years after harvest in shelterwood cut areas, priority would be given to artificial reforestation of these areas rather than timber sale preparation elsewhere.
11. Consider the needs of appropriate Federally recognized tribes for non-commercial use of forest products as provided by treaty.
12. All harvest units susceptible to livestock damage would be protected by grazing closures, fencing, or comparable measures until regeneration is established at proper stocking levels.
13. Firewood cutting permits would be issued, with the following exceptions:
  - (a) No firewood cutting (see *Glossary*, p. 172) would be allowed in riparian areas (see *Glossary*, p. 180). Exceptions would be considered through the ID team process as part of special vegetation management projects designed to encourage sprouting and regeneration of cottonwood/aspen stands.
  - (b) Firewood cutting and firewood gathering (see *Glossary*, p. 172) would be prohibited within designated recreation sites.
  - (c) Firewood cutting permits for standing trees would be denied within SRMAs, except where tree cutting meets the objectives stated in Forest Resources, #24, p. 52. Firewood gathering within SRMAs would be limited to dead-and-down material.
14. Forest stand management treatments would be timed to maximize the productivity of the timber resource, while promoting forest stand structure and diversity typical of all seral stages for the managed habitat type on a drainage basis.
15. Maintain all stream beds, springs, bogs, and streamside vegetation in an as near-natural state as possible. Timber harvest activities would not occur within riparian areas (as defined in *Attachment 4*, pp. 105-106, except as stated below. Logging or road construction activities would only be considered within riparian areas to (a) provide for necessary road crossings; (b) remove (via cable logging methods) or reduce insect or disease risk to the timber stand; or (c) skid timber on at least 12 inches of snow cover.
16. An additional 50-foot modified activity strip would be established along perennial streams to supplement the no activity buffer described in #15 above. Heavy equipment would be excluded from this 50-foot wide area, but timber may be removed by cable. Exceptions may be designed by an interdisciplinary team.
17. Seasonal harvest restrictions and road closures would be imposed to protect soils, watershed, and wildlife values during critical periods.

18. Consult the IDFG and appropriate Federally recognized tribes about stipulations to protect elk habitat quality in the Donkey Hills area, prior to authorization of any actions that may affect elk habitat. Harvest timber in accordance with the following stipulations, to protect elk habitat quality: (a) timber would be removed by helicopter or cable logging to existing roads only - no new roads would be constructed, (b) Douglas-fir would be harvested by shelterwood or group selection cuts only, (c) clearcuts in lodgepole pine would be 10 acres or smaller, and (d) a 200 foot uncut buffer zone would be left around the edges of all harvest units. Uncut buffer zones may be harvested when cut units have regenerated sufficiently to meet elk habitat requirements.
19. Allow logging on the Willow Creek Summit elk winter ranges, in accordance with the Willow Creek Summit elk HMP. Manage harvest to protect elk habitat quality. Coordinate design with the IDFG and appropriate Federally recognized tribes.
20. Allow only helicopter logging in the Lone Pine Peak area (see *Map C: Suitable Commercial Timberlands*), to protect watershed resources in Lone Pine Creek and retain the visual characteristics of the area.
21. Commercial timber harvest practices on BLM lands would exceed standards contained in applicable State approved BMPs for timber harvest.
22. Remove forty-one (41) small forest stands totalling about 980 acres (primarily old growth) from the commercial timber base to maintain wildlife cover in open areas (see *Map C: Suitable Commercial Timberlands*).
23. If released from wilderness review, WSAs would be open to forest management, including commercial timber harvest, with the following limitations and exceptions on commercial timber harvest: (a) In the nonsuitable portions of the Jerry Peak and Corral-Horse Basin WSAs, timber stands more than 1/2-mile from roads existing at the time of RMP approval (see *Glossary: "road," p. 181 and "existing roads, vehicle ways, and trails," p. 172*) would be available for harvest by helicopter logging only. (b) Suitable portions of the Jerry Peak WSA if released from wilderness review would remain closed to timber harvest to maintain old growth forest values and biodiversity associated with large undisturbed tracts of forest land.
24. Tree cutting (see *Glossary, p. 184*) in riparian areas would be allowed only to restore degraded riparian conditions resulting from catastrophic events, to meet aquatic resource objectives, or for safety hazard reduction.

*For additional RMP decisions regarding management of forest resources, also see "General" SOPs listed in Attachment 5, p. 107 and forest management-related design specifications listed in Attachment 8, pp. 120-123.*

## Hazardous Materials Management

**Goal 1:** Prevent the occurrence of hazardous materials/waste incidents on public lands. Minimize the human health threat and the risk to natural resources from hazardous materials contamination through access control, hazardous materials removal, containment, and remediation actions. Ensure protection of human health and the environment when using or transporting hazardous materials/wastes on public lands. Minimize wastes and prevent pollution generated on or released on public lands and BLM facilities.

**Rationale:** By law, the Bureau of Land Management must protect its employees, public health, and resources from contamination by hazardous materials.

1. No public lands would be leased or permitted for the storage, treatment, or disposal of hazardous waste, nor would public lands be leased for purposes of sanitary landfills. Lands may be sold or exchanged for these purposes under an appropriate lands action.
2. Eliminate the use or transportation of hazardous materials or toxic substances on public lands where feasible. Assess risks of authorized use through project and activity planning and modify actions to eliminate or reduce risk to acceptable levels.
3. Increase education and law enforcement actions in order to reduce illegal disposal of hazardous wastes on public lands.
4. Inventory abandoned mine sites, lease and permit sites, rights-of-way, and any other activities that may have produced a hazardous materials incident on public lands. As time and budget allow, prioritize and investigate sites potentially containing hazardous materials.
5. Develop special stipulations as part of permits, leases, or actions in order to safeguard human health and prevent environmental damage.

*For additional RMP decisions regarding management of hazardous materials, also see Attachment 5: Standard Operating Procedures - Hazardous Materials, p. 108.*

---

## Land Tenure and Access

**Goal 1:** Retain lands with significant resource values in public ownership. Seek to acquire additional lands having high public values, through lands actions such as exchange, donation, or willing-seller purchase.

**Rationale:** As described in FLPMA, Section 102(a)(1), it is the policy of the United States that the public lands be retained in Federal ownership, unless it is determined that disposal of a particular parcel will serve the national interest.

1. Retain approximately 729,500 acres of BLM lands within the Management Areas (see *Glossary*, p. 176) shown on *Map A: Adjustment/Management Areas* in public ownership

for the long term.

2. Priorities for land tenure adjustments would be the following: acquire lands with high resource values; consolidate public lands; resolve unauthorized use conflicts; provide for tribal treaty uses; pursue public access; and facilitate threatened/endangered species recovery.
3. Riparian, wetland, and floodplain habitat could be exchanged, but only for areas containing riparian, wetland, or floodplain habitat with equal or greater values for recreation, access, wildlife, fisheries, and biodiversity. Such exchanges would have to balance similar resource values for each individual exchange, although both tracts of land would not have to be within the boundaries of the Challis Resource Area. Where possible, land exchanges would be made to facilitate recovery of threatened or endangered species.
4. Lands acquired for special values, such as unique or fragile resources, would be retained in Federal ownership and managed to maintain or improve those special values for which they were acquired.
5. Retain the BLM adjustment parcel located at T14N, R22E, Sec. 21, S1/2NE, NESE (see *Map A: Adjustment/Management Areas*) in public ownership, unless exchanged for equivalent resource value Pahsimeroi River frontage.
6. Approximately 12,315 acres of BLM land have been identified for potential disposal only in exchange for private parcels located within the Chilly Slough Wetland Conservation Project area (see *Map 18: Chilly Slough Wetland Conservation Project Area and Map A: Adjustment/Management Areas*). An additional 2,962 acres would be available for either Chilly Slough or State of Idaho exchange only. Note: The exchange restrictions described herein do not apply to lands under existing agricultural or occupancy trespass or lands listed as sale parcels in *Attachment 17*, p. 151.
7. Public river frontage along the Main Salmon River and the East Fork Salmon River can be offered for disposal, provided that additional lands with greater or equal resource values (e.g., river frontage, public access and associated riparian values) are acquired concurrently on a case-by-case basis. Tracts meeting the definition of omitted lands and unsurveyed islands (see *Glossary*, pp. 178 and 185) would not be subject to this requirement. If opportunities arise, enhance public access through acquisition of additional lands.
8. Retain in public ownership all areas containing Native American burial areas (see *Cultural Resources*, Goal 1, #12, p. 42).
9. Retain public lands containing cultural resources eligible to be listed in, or listed in, the National Register of Historic Places (NRHP) (see *Glossary*, p. 176) on a case-by-case basis.
10. Prior to any land tenure adjustments, consult appropriate Federally recognized tribes to ensure protection of tribal treaty rights.

11. Retain public lands containing significant paleontological resources on a case-by-case basis.
12. Retain public lands under BLM administration unless the receiving parties agree to continue to maintain or to restore (if degraded) and permanently maintain floodplain and wetland functions.
13. Pursue acquisition of State and private lands in the Donkey Hills ACEC, with emphasis on land exchanges and cooperative efforts with conservation organizations such as the Rocky Mountain Elk Foundation.
14. Pursue acquisition of State lands within the Birch Creek ACEC.

**Goal 2:** Identify BLM public lands which may be available for disposal to achieve purposes such as (a) consolidating public lands to enhance management capability, (b) allowing agricultural entry, or (c) meeting other important public objectives.

**Rationale:** Consolidated land patterns would provide better land management and administration for both public and private landowners. FLPMA allows for sale or other disposal of public lands when specific criteria are met, including identification of those lands during the land use planning process.

1. Offer sufficient public lands for sale or exchange to mitigate loss of tax revenue to Custer or Lemhi counties that may occur as a result of BLM acquisitions of private land needed to meet important public resource objectives.
2. Only the BLM tracts within the adjustment areas shown on *Map A: Adjustment/Management Areas* (approximately 63,075 acres) would be made available for disposal under the Federal Land Policy and Management Act (FLPMA), except as follows: A parcel of land which is at issue in a long-standing water rights trespass situation may be considered for exchange only as a possible resolution to the water rights trespass issue, regardless of whether the parcel is located in an adjustment area or a management area, subject to all other land tenure adjustment requirements contained elsewhere in this PRMP. (See *Glossary: Adjustment Area; disposal tracts*, pp. 166 and 170).
3. Within the adjustment areas shown on *Map A: Adjustment/Management Areas*, a total of about 4,805.84 acres would be considered for sale under the following FLPMA authorities (see *Attachment 17*, p. 151):
  - (a) Approximately 3,324.63 acres would be considered for sale, because they are difficult and uneconomical to manage (FLPMA, Section 203(a)(1)).
  - (b) Approximately 1,481.21 acres would be considered for sale, because they meet public objectives such as community expansion and economic development (FLPMA Section 203(a)(3)).

4. Desert Land Entry applications would not be considered on lands determined to be nonsuitable for agricultural purposes. Lands suitable for transfer under agricultural authority must meet the following criteria (Desert Land Act of 1877) and be within the adjustment areas identified on *Map A: Adjustment/Management Areas*:
  - (a) suitable soils for agricultural development (NRCS classification - 40% class III soils or better for each 40 acre parcel) (see *Glossary: soil capability classes*, p. 182);
  - (b) slopes less than 20%; and
  - (c) elevation less than 6,300 feet above sea level.
5. Riparian areas, floodplains, and wetlands transferred out of public ownership would contain covenant language in the deed to protect the wetland resource values from degradation.
6. Proposals for disposal of tracts within the adjustment areas (see *Map A: Adjustment/Management Areas*) would be considered through the NEPA and ID team planning process.
7. Approximately 36, 915 acres of the 63,075 acres shown as adjustment areas on *Map A: Adjustment/Management Areas* would be available for exchange only with the State of Idaho for State managed lands
8. Tracts of public land within an ACEC may be exchanged for private or State lands within or adjacent to the ACEC, provided that the acquired lands are of equal or greater benefit to the integrity and management of the associated ACEC.
9. Prior to lease renewal, the BLM would offer to the State of Idaho, for sale or exchange, the tracts of land currently leased to the State of Idaho, Bureau of Aeronautics, for the May and Twin Bridges airports. The sale or exchange would contain covenant language that would require the tracts to continue to be used as public airstrips. The Twin Bridges airport (about 60 acres) is located in T7N, R20E, Sec. 9 SW<sup>4</sup> and Sec. 17 NE<sup>4</sup>. The May Airport (about 125 acres) is located in T15N, R22E, portions of Sec. 19, 20, and 29.
10. Public lands within an existing WSA which are identified as adjustment areas for potential disposal (see *Map A: Adjustment/Management Areas*) would be available for potential disposal only if the WSA is released from wilderness review.
11. The isolated tract on the south side of the Trail Creek Road (53 acres) which is proposed for removal from the Thousand Springs ACEC/RNA (see ACECs - Thousand Springs ACEC, #1, p. 39) would be identified for potential exchange for lands with comparable resource values that would enhance the integrity of the Thousand Springs ACEC.

**Goal 3:** Consider public needs for use authorizations, such as rights-of-way, leases, permits, and withdrawals.

**Rationale:** Required by law, regulations, and policy.

1. Except for restrictions in WSAs (see Goal 3, #2 below), allow rights-of-way in Special Management Areas (SMAs) (see *Glossary*, p. 182) only if it can be demonstrated that there would be no negative effect on the special values for which the SMA was designated. All other BLM lands would be considered for rights-of-way through site-specific analysis. No right-of-way leases, permits, or easements would be authorized in riparian areas (as defined in *Attachment 4*, pp. 105-106), that would hinder attainment of the riparian and aquatic habitat conditions described in *Attachment 15* (see p. 149).
2. Rights-of-way would be excluded from existing WSAs. Rights-of-way in WSAs released from wilderness review would be considered under normal BLM procedures.
3. Continue to authorize the following communications sites (see *Map 19: Communication Sites*): Willow Creek Summit, Challis, Saturday Mountain, Poverty Flat, Summit Creek, Mackay AT&T. Evaluate future proposals for communication site authorization on a case-by-case basis.
4.
  - (a) Pursue recommendations for release of Federal Energy Regulatory Commission (FERC) withdrawals as needed. Manage areas released from FERC withdrawal consistent with other decisions in this RMP.
  - (b) Consider applications for FERC projects on a case-by-case basis. Approval of hydropower rights-of-way would be contingent upon maintenance of sufficient instream flows to ensure progress toward desired riparian and aquatic habitat conditions (see *Attachment 15*, p. 149). Locate any new hydropower facilities associated with the right-of-way outside of riparian areas (as defined in *Attachment 4* (see pp. 105-106).
5. No new short term permits or long term leases would be issued for the following actions: (a) new public waste disposal sites; (b) new or existing private waste disposal sites; and (c) sites for storage or disposal of hazardous material. Accommodate public demand for these types of sites through the sale tracts shown in Land Tenure, Goal 2, #3, p. 55.
6. Lands currently under lease as a landfill would be sold, exchanged, or otherwise conveyed to Custer County or another qualified entity. An additional 280 acres of BLM lands adjacent to the existing landfill site would be considered for conveyance to Custer County as landfill expansion.
7. Prior to approval of any public demand land uses, consult appropriate Federally recognized tribes to ensure protection of tribal treaty rights.
8. New rights-of-way for water to be diverted from public land by a private claimant would only be granted if (a) the diversion facility is controllable, measurable, and/or designed to divert, at most, that amount of water permitted in the water right, and (b) the diversion would have no significant impact on existing resource values, and (c) granting the right-

of-way would not adversely affect achievement of riparian management or aquatic objectives, and (d) when appropriate, the diversion facility is designed and constructed in accordance with the latest fish screening and bypass criteria. When renewing existing rights-of-way for water diversion, stipulate the renewed right-of-way to achieve (a), (b), (c) and (d) above, to the extent possible.

**Goal 4:** Eliminate unauthorized use of public lands.

**Rationale:** Required by law, regulations, and policy.

1. Resolve long term agricultural or occupancy trespass through termination or through authorization by lease, sale, or exchange where such actions would meet other important public objectives. Terminate and rehabilitate new trespasses. Short term permits may be used to authorize agricultural or occupancy trespass while resolution is being pursued.
2. Unauthorized uses which are terminated and involved ground-disturbing activities would be seeded with an appropriate seed mix within 8 months (see *Attachment 8: Design Specifications, "General," #2-4*, pp. 120-121). Cost for reclamation of intentional trespass would be incurred by the violator.

**Goal 5:** Improve management of the public lands through increased access for public enjoyment, administrative needs, and pursuit of tribal treaty rights.

**Rationale:** Legal access across private, State, and other Federal lands is often necessary for management of public lands, and Section 205 of FLPMA authorizes the acquisition of access where necessary to better manage public lands.

1. Attempt to acquire legal access through purchase, exchange, or donation as follows:
  - (a) non-motorized, legal, public access to McDonald Creek, Fox Creek, Pine Creek, and Twin Bridges Creek;
  - (b) motorized, legal, public access to Mill Creek, Big Creek, the Donkey Hills, and Meadow Creek in the Pahsimeroi Valley;
  - (c) legal, public access in French Creek, Sullivan Creek, Allison Creek, Centennial Flat, and Lyon Creek and nonmotorized legal, public access in Cow Creek;
  - (d) legal, public access to Bady Creek/Harry Canyon and Navarre Creek; and
  - (e) the easements shown in *Attachment 22*, p. 158 would be pursued to ensure public access to BLM roads.
2. Maintain or improve public access to public lands through covenant language in all land tenure adjustments.

## Livestock Grazing

**Goal 1:** Manage livestock grazing levels in line with the long term capacity of the land, considering multiple use and climatic variability, to maintain, improve, or make significant progress toward improving ecological condition as follows: Increase the percent of stream riparian/wetland areas in proper functioning condition (as defined in *Attachment 1: Riparian-Wetland Area Function Classification*, pp. 101-102) from 35.8% (based on the most recent riparian functionality assessments) to 75% within 5 years. Increase rangelands in the late seral to Potential Natural Community (PNC) stage from 37.1% (based on the most recent range inventories) to 40% by 2009. Reduce the percentage of public rangelands in the early seral stage from 16.2% (based on the most recent range inventories) to 10% by 2009.

**Rationale:** Managing livestock grazing levels in line with the long term capability of the land is in accordance with FLPMA, Sec. 103 (c). The ecological condition goals are from *The State of the Public Rangelands 1990, The Range of Our Vision* (BLM 1990).

1. Manage livestock grazing activities to ensure achievement and maintenance of, or significant progress toward achieving, fundamentals of rangeland health, and standards for rangeland health and guidelines for livestock grazing management (per 43 CFR 4180).
2. Continue existing livestock grazing preference allocations of 51,069 AUMs for the short term. Conduct vegetative monitoring (e.g., utilization pattern mapping (UPM), ecological site inventory (ESI)) to determine appropriate long term stocking levels. Initial priority would be to establish stocking rates for the following allotments: Burnt Creek, Bear Creek, Bayhorse, Countyline, Dry Creek, Herd Creek, Lower Goldburg, Sage Creek, Mountain Springs (San Felipe), Upper Pahsimeroi, and Warm Springs.
3. Approximately 771,224 acres (97.3% of the Resource Area) would continue to be open to managed livestock grazing.

(a) The following areas would continue to be closed to livestock grazing::

Cronk's Canyon Bighorn Sheep Pasture	1,496 acres
Morgan Creek Bighorn Sheep Pasture	3,642 acres
Bruno Creek Allotment (mining)	2,378 acres
Sand Hollow Area (watershed)	3,332 acres
Malm Gulch Area (watershed)	9,136 acres
East Fork Salmon River Bench (ACEC)	78 acres
Summit Creek exclosure (plants)	<u>305 acres</u>
Total:	20,367 acres

- (b) In addition, close the south half of the Highway Allotment (976 acres) to livestock grazing (see Livestock Grazing, Goal 1, #12, p. 61). (Also see *Map 27: Grazing Closures.*)

4. Revise existing Allotment Management Plans (AMPs) as needed, through completion of a watershed assessment and development of an Integrated Resource Activity Plan (IRAP) (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103). For allotments without an existing AMP, consider livestock grazing management in the development of IRAPs for geographical areas which include those allotments. Priority would be given to those watersheds with special status fish species concerns, as shown in Fisheries, Goal 1, p. 45. Criteria for grazing riparian areas would be included: see Riparian Areas, Goal 1, #4 - 7, pp. 79-80; *Attachment 3: Component Practices for Grazing Management in Lieu of BMPs*, p. 104; and Fisheries, Goal 1, #4, p. 46.
5. Plan, design, and manage land use activities, including grazing management actions and range improvement projects, located on the (a) Morgan Creek, Cronk's Canyon, East Fork Salmon River, and Birch Creek/Mud Springs Gulch bighorn sheep winter ranges (see *Map 17: Bighorn Sheep Winter Ranges*) or the (b) Willow Creek Summit or Donkey Hills elk winter ranges (see *Map 21: Elk Winter Ranges and Donkey Hills Calving Area*) to ensure the continued viability of bighorn sheep and elk populations dependent on these key habitat areas. Fully analyze any potential for adverse effects on the viability of bighorn sheep or elk populations in appropriate site-specific NEPA documentation.
6. Develop vegetative monitoring to measure site-specific objectives. Prioritize monitoring of I category allotments (see *Glossary* definition: allotment categorization, p. 166). Use *Minimum Monitoring Standards* and other approved methods. Emphasize monitoring of perennial riparian systems with high potential for improvement. Climatic monitoring would consist of primarily National Oceanographic and Atmospheric Administration (NOAA) and remote area weather station (RAWS) site data. Base use adjustments on monitoring results.
7. Use the following utilization criteria (see *Glossary*: utilization; utilization criteria, p. 185) on key areas of upland sites (where an ID team has determined the key area and key species) to determine the proper time to move livestock to the next pasture in a grazing system or from the allotment:

<u>Season of Use</u> <sup>1</sup>	<u>Key Species</u>	<u>All Other</u>
	<u>Agsp</u> <sup>2</sup>	<u>Key Species</u>
Early: Prior to Boot	50%	50%
Critical: Boot to Flowering	40% <sup>3</sup>	50%
Late: After Flowering	60%	50%
Dormant: Dormant/winter	60%	60%

<sup>1</sup>See *Glossary* definition: season of use, p. 181.

<sup>2</sup>Agsp-*Agropyron spicatum*, bluebunch wheatgrass.

<sup>3</sup>On sites where an ID team has determined that the health and vigor of bluebunch wheatgrass are less than satisfactory, a lower utilization level or one or more years of rest would be initiated.

Knowledgeable and reasonable practices (see *Glossary*, p. 175) other than the utilization levels listed above (e.g., alternative stubble height criteria) may be used to determine the timing of livestock movements. Any alternative utilization levels other than those listed

above would be based on the following: (a) current scientific literature or other applicable study results which document the biological effects of the alternative levels of use on the key species; (b) the recommendations of an interdisciplinary team responsible for reviewing, interpreting and documenting the scientific literature or study results; and (c) a site-specific environmental assessment to document how the alternative criteria would help meet resource objectives.

8. Manage livestock grazing to ensure progress toward the riparian and aquatic habitat conditions described in *Attachment 15* (see p. 149). See the stubble height criteria, bank shearing criteria, and knowledgeable and reasonable practices described in Riparian Areas, Goal 1, #4-7 (see pp. 79-80).
9. Continue existing management (including periodic grazing) of the Anderson Ranch riparian pasture to ensure progress toward the riparian and aquatic habitat conditions described in *Attachment 15* (see p. 149). Develop riparian pastures and riparian study exclosures throughout the RA where an ID team identifies the opportunity.
10. Manage rangeland sites for late seral or Potential Natural Community to meet the objectives stated in Goal 1, unless an ID team determines during activity planning that some other Desired Plant Community would better achieve multiple use and meet the goals of rangeland health. Indicators of rangeland health would include (a) soil stability and watershed function, (b) distribution of nutrients and energy, (c) recovery mechanisms, and (d) riparian functioning condition.
11. In all fish-bearing streams, design grazing practices to be consistent with attainment of or progress toward the riparian and aquatic habitat conditions described in *Attachment 15* (see p. 149). When necessary, locate livestock handling and management facilities and activities outside riparian areas (see Upland Watershed, Goal 1, #2, p. 87).
12. Combine or split allotments as needed, to provide increased management flexibility in meeting riparian and upland objectives. For highway safety reasons, combine the north half of the Highway Allotment with the Little Morgan Creek Allotment and close the south half of the Highway Allotment.
13. Grazing privileges that are lost, retired, relinquished, canceled, or have base property sold without transfer would have attached AUMs held for watershed protection and wildlife habitat until allotment vegetative objectives are reached. Once vegetative objectives are reached, these AUMs would remain unallocated to any particular livestock permittee, but may be used to provide short term (less than three years) flexibility to permittees for vegetation treatments or other management actions affecting their base permit.
14. Manage all watersheds in the Resource Area to achieve 70% vegetative cover on uplands as measured prior to grazing, or, for sites not capable of achieving 70% cover, 90% of cover achievable under Potential Natural Community.
15. Coordinate with appropriate Federally recognized tribes on range practices and management that may affect pursuit of tribal treaty rights.

16. Allocate nonuse AUMs to watershed protection, wildlife habitat, plant maintenance, and improvement of ecological condition to meet related allotment objectives. Nonuse AUMs may be authorized for temporary nonrenewable use after an ID team has determined that related allotment objectives are being met.
17. Exclude livestock from the portions of developed recreation sites (see *Glossary*, p. 170) which receive intensive use and are listed below, as well as appropriate portions of recreation sites developed in the future.

Mackay Reservoir  
Pinto Creek Recreation Site (Garden Creek)  
Upper East Fork Campground (Little Boulder Creek)  
Jimmy Smith Lake Campground  
East Fork Recreation Site  
Summit Creek Recreation Site  
Bayhorse Creek Recreation Site  
Deadman Hole Recreation Site  
Wood Creek Recreation Site (Dugway)  
Round Valley Recreation Site (Challis Bridge)  
Morgan Creek Recreation Site  
Herd Lake Campground  
Herd Lake Overlook  
Bison Jump Recreation Site  
Cottonwood Recreation Site

18. Exclude livestock from areas of known human burial concentrations.

**Goal 2:** Improve livestock distribution to meet resource management objectives and improve overall range conditions.

**Rationale:** Managing livestock movements is necessary to achieve RMP and activity plan objectives.

1. Continue to require permittees to maintain range improvements (to current BLM standards) that are under cooperative agreement or permit. Livestock would not be allowed in a pasture until range improvements under cooperative agreement or permit are functional and properly maintained. The BLM would continue to maintain exclosures as needed.
2. Prescribed burns and seedings would be done to promote a variety of resource objectives, including ecosystem health and diversity. See Rangeland Vegetation Treatment Projects, Goal 1, #2 (p. 73) for further criteria.
3. Use land treatments, range improvements, and improved grazing management as tools to achieve multiple resource objectives. Evaluate existing seedings for re-treatment before any new seedings are done within a given allotment. Authorize permanent increases in livestock preference as a result of range improvement projects only after an ID team has performed an allotment analysis and determined that resource management objectives for the allotment have been met.

4. Continue to use allotment categorizations (see *Glossary*, p. 166) to help establish priority for rangeland monitoring and installation of range improvements. See *Appendix F, Item 1: Allotment Summary*, pp. 644-645.

For additional decisions regarding management of livestock grazing, **also see** applicable standard operating procedures in *Attachment 5* (pp. 107-112) and applicable design specifications in *Attachment 8* (pp. 120-123).

---

## Minerals

Management Decisions Which Apply to Development of All Types of Minerals: (see *Glossary*: Leasable Minerals, p. 175, Locatable Minerals, p. 176, and Saleable Minerals, p. 181)

1. Apply "minerals" design specifications (*Attachment 8*, p. 122) and "general" standard operating procedures (*Attachment 5*, p. 107) as appropriate.
2. Areas of known concentrations of human burials would be withdrawn from locatable mineral entry and mineral material disposal, and stipulated no surface occupancy for the purposes of energy and non-energy mineral leasing (see Cultural Resources, Goal 1, #12, p. 42).
3. Coordinate and consult with appropriate Federally recognized tribes on proposed mineral developments which may affect Indian trust resources and pursuit of tribal treaty rights.
4. Wild and Scenic River segments which are found suitable or have a suitability finding deferred until a later coordinated suitability study (see WSR, pp. 98-100) would be open to mineral development (energy mineral development would be subject to standard stipulations -- see Goal 1, "Note" below), if consistent with the maintenance of WSR values (see WSR, Goal 1, #1, p. 98) and management of mineral development in riparian areas (see Minerals, Goal 1, #6, Goal 2, #6 and Goal 3, #5, pp. 64 and 66).

**Goal 1:** Manage the Federal mineral estate in the Resource Area for oil, gas, and geothermal exploration and development, while minimizing adverse impacts to other resource values (see *Glossary*: leasable minerals, p. 175).

**Rationale:** Federal regulations provide for management of leasing and development to prevent unnecessary adverse effects on other resource values.

**Note:** The following phrases have specific meanings where they are used in decisions in this section:

*Subject to standard lease stipulations* - Some or all of the 10 lease stipulations listed in *Attachment 10*, pp. 135-143 (including the no surface occupancy (NSO) stipulation - #3) **may** be applied on a case-by-case basis when

an Application for Permit to Drill (APD) is received by the BLM from a company intending to conduct exploratory drilling.

*Subject to the no surface occupancy (NSO) stipulation* - In addition to other standard lease stipulations, the special no surface occupancy stipulation listed in *Attachment 10* (Stipulation 3, p. 138) **may** be applied to APDs on a site-specific basis on areas less than 40 acres in size or 1/4-mile in width to protect important resource values.

*Mandatory no surface occupancy stipulation* - In addition to other standard lease stipulations, the special no surface occupancy stipulation listed in *Attachment 10* (Stipulation 3, p. 138) **would apply, without exception**, to that portion of the lease area which overlaps the area identified in the management decision.

1. Approximately 650,856 acres (82.1% of the Challis Resource Area) would be open for oil, gas, and geothermal leasing, with discretionary or mandatory lease stipulations to protect resource values as shown in #3-7 below (see *Attachment 10: Leasable Minerals Stipulations*, pp. 135-143).
2. The existing campgrounds and recreation sites listed in *Attachment 21*, pp. 156-157 (1,450.76 acres) and existing WSAs (140,260 acres), unless released from wilderness review (see Goal 1, #4 below), would continue to be closed to oil, gas, and geothermal energy development.
3. Special Recreation Management Areas (SRMAs) (see *Map 40: SRMAs*) would be open to oil, gas, and geothermal leasing, subject to the no surface occupancy stipulation to protect recreational and scenic values (see *Attachment 10*, Stipulation 3, p. 138).
4. If released from wilderness review, suitable WSAs (38,930 acres) would be open to oil, gas, and geothermal leasing, subject to the no surface occupancy stipulation; unsuitable WSAs (101,330 acres) would be open to oil, gas, and geothermal leasing, subject to standard stipulations (see *Map 42: WSAs*). (Currently, all WSAs are closed to oil, gas, and geothermal leasing.)
5. ACECs (88,206 acres) (see *Map 4: ACECs - General Location*) would be open to oil, gas, and geothermal leasing, subject to standard stipulations to protect resource values.
6. In riparian areas not within fish-bearing streams, oil, gas, and geothermal lease activities would be reviewed and modified on a case-by-case basis to protect riparian and aquatic habitats. A mandatory NSO stipulation would apply to energy mineral leases on riparian areas in salmon, steelhead trout, and bull trout watersheds. Energy mineral activities in riparian areas along all fish-bearing streams would be designed, constructed, and operated so as not to hinder attainment of the riparian and aquatic habitat conditions described in *Attachment 15*, p. 149.

**Goal 2:** Provide saleable and non-energy leasable minerals to meet local demand, while minimizing adverse impacts to other resource values (see *Glossary*: saleable minerals, p. 181; leasable minerals, p. 175).

**Rationale:** Federal law allows for sale, lease, and some free use of certain mineral materials to meet local needs, subject to applicable regulations.

**Note:** The following phrases have specific meanings where they are used in decisions in this section:

*Subject to standard lease stipulations* - Some or all of the 10 lease stipulations listed in *Attachment 10*, pp. 135-143 (including the no surface occupancy stipulation - #3) **may** be applied to non-energy mineral leases on a case-by-case basis to protect important resource values.

*Mandatory no surface occupancy stipulation* - In addition to other standard lease stipulations, the no surface occupancy stipulation listed in *Attachment 10* (Stipulation 3, p. 138) **would apply, without exception**, to that portion of the non-energy mineral lease area which overlaps the area identified in the management decision.

1. Approximately 632,284 acres of public lands (79.8% of the RA) would be open to mineral materials disposal. Approximately 650,856 acres of public lands (82.1% of the RA) would be open to non-energy mineral leasing, with discretionary or mandatory lease stipulations for protection of other resource values.
2. The campgrounds and recreation sites listed in *Attachment 21*, pp. 156-157 (1,450.76 acres) and existing WSAs (140,260 acres), unless released from wilderness review (see Goal 2, #5 below), would continue to be closed to mineral materials disposal and non-energy mineral leasing.
3. Mineral material disposals and leasing of non-energy minerals would be allowed in SRMAs when the actions are determined through the ID team and NEPA process to be consistent with maintenance of Special Management Area values. To maintain recreational and scenic values in the Upper Salmon River and Upper Big Lost River SRMAs, mineral material disposals and non-energy leasing would be limited to existing sites and sites not visible from the Salmon River or upper Big Lost River or the following roads: Trail Creek Road, East Fork Road, Highway 75, and Highway 93 South, unless a site-specific scenic quality assessment determines there would be no significant impact to SRMA resources (see *Map 40: SRMAs*).
4. Mineral material disposals and non-energy mineral leasing would be allowed in ACECs when the actions are determined through the ID team and NEPA process to be consistent with maintenance of ACEC values. The Lone Bird and Malm Gulch/Germer Basin ACECs (17,792 acres) would be closed to rockhounding, collection of mineral materials, and mineral material sales (see *Map 11: ACECs - Lone Bird ACEC* and *Map 12: ACECs - Malm Gulch/Germer Basin ACEC*).

5. If released from wilderness review, suitable WSAs (up to 38,930 acres) would remain closed to non-energy minerals leasing and mineral material sales; nonsuitable WSAs would be opened to mineral material sales and non-energy minerals leasing, subject to standard stipulations. (Currently, all WSAs are closed to non-energy minerals leasing and mineral material sales.)
6. In riparian areas not within fish-bearing streams, mineral material and non-energy leasing activities would be reviewed and modified on a case-by-case basis to protect riparian and aquatic habitats. Riparian areas in salmon, steelhead trout, and bull trout watersheds would be closed to mineral material sale and extraction and non-energy leasing, and ancillary mineral facilities would not be permitted. Mineral material and non-energy leasing activities in fish-bearing streams outside salmon, steelhead trout, and bull trout watersheds would be designed, constructed and operated so as not to hinder attainment of the riparian and aquatic habitat conditions described in *Attachment 15*, p. 149.

**Goal 3:** Maintain the availability of public lands for locatable mineral exploration and development (see *Glossary: locatable minerals*, p. 176). Minimize adverse effects of locatable mineral development activity on other resources.

**Rationale:** It is Federal policy to allow development of Federal mineral resources and promote reclamation of disturbed lands. Mineral exploration and development are a statutory right on unappropriated and unreserved public lands, except where specifically withdrawn from mineral entry under Secretarial or Congressional authority.

1. Approximately 791,116 acres of the Federal mineral estate in the Resource Area (99.8%) would be open to locatable mineral entry.
2. The campgrounds and recreation sites listed in *Attachment 21*, pp. 156-157 (1,450.76 acres) would continue to be withdrawn from locatable mineral entry.
3. If released from wilderness review, suitable WSAs (38,930 acres) would be recommended for withdrawal from locatable mineral entry to maintain primitive values; nonsuitable WSAs (101,330 acres) would be open to locatable mineral development. (Currently, all WSAs are open to locatable mineral entry, subject to restrictions defined in the Interim Management Policy and Guidelines for Lands Under Wilderness Review (BLM 1995: 36-38).)
4. ACECs would be open to locatable mineral entry, subject to approval of a plan of operations (see *Map 4: ACECs - General Location*).
5. Locatable mineral activities in riparian areas not within fish-bearing streams would be reviewed and modified on a case-by-case basis to protect riparian and aquatic habitats. Locatable mineral activities in riparian areas along fish-bearing streams would be designed, constructed, and operated so as not to hinder attainment of the riparian and aquatic habitat conditions described in *Attachment 15*, p. 149.

## Minimum Streamflow

**Goal 1:** Maintain riparian areas, improve fish migration, decrease fish mortality, provide for recreational opportunities, and maintain aesthetics by facilitating the acquisition of minimum streamflows.

**Rationale:** Dewatering of streams has the potential to negate riparian and aquatic habitat improvement efforts. Lack of water also creates a problem for fish migration, recreational pursuits, and aesthetics.

1. The BLM would support those activities designed to acquire minimum streamflows crossing and benefitting BLM lands.
2. Pursue applications to the Idaho Water Resources Board for adequate minimum streamflows at the rate of at least one per year to protect riparian and fisheries habitat and recreation opportunities, following procedures and the list of streams shown in *Attachment 14: Procedures for Minimum Streamflow Application*, p. 148.

---

## Noxious Weed Infestations

**Goal 1:** Reduce potential for new infestations of noxious weeds (see *Glossary*, p. 177).

**Rationale:** Prevention of weed infestations is generally more effective than eradication of established populations.

1. Seed used for revegetation projects on BLM public lands would be certified weed-free for Idaho, Montana, Oregon, and Utah noxious weeds.
2. Feeding of commercial stock or wildlife with hay may be allowed on BLM lands after review by an ID team. The feeding permit holder would be required to feed only certified weed-free hay and to eliminate any new weed infestation which may result from this feeding. Incidental livestock feeding with hay would not require an ID team review, but certified weed-free hay would be required.

**Goal 2:** Develop an active weed inventory program by training public land users and BLM personnel in weed identification.

**Rationale:** Infestations are most effectively treated when small and isolated, but such populations are difficult to locate.

1. Coordinate with Federal, State, and local agencies and private landowners in the identification of weed treatment areas.
2. Provide training for BLM personnel on weed identification, habitats, and life cycles, and the importance of noxious weed inventories.

3. Utilize the presence of public land users (*e.g.*, permittees, recreationists, hunters) for weed inventory by developing a "weed watch" program.

**Goal 3:** Control expanding populations, reduce large infestations, and eliminate small populations of noxious weeds that threaten or impact other resources.

**Rationale:** Weed infestations reduce the value of the public lands for forage production, recreation, biodiversity, and wildlife. Infestations on public lands are a threat to adjacent property. Idaho's noxious weed law requires property owners to control noxious weed infestations on their lands.

1. Treat noxious weed infestations at the rate of about 150 acres per year utilizing integrated pest management (see *Glossary*, p. 174). Recognizing the contribution to biodiversity of native poisonous plants, control of native poisonous plants would be considered on a case-by-case basis through the ID team planning process.
2. Set priority control areas using the following criteria: (a) target species is a non-native noxious weed, and (b) target population is small and isolated. Treatment of native invasive plant species (*e.g.*, larkspur) would be a lower priority.
3. Chemical treatments on BLM public lands would be applied or supervised by personnel certified as pesticide applicators by the State of Idaho or the BLM.
4. Explore integrated pest management options for populations that are difficult to treat through conventional (herbicide) treatment (large populations, populations in sensitive areas, remote populations).
5. Monitor the effectiveness of noxious weed treatment on an annual basis.
6. Sensitive areas (recreation sites, areas within 30 feet of perennial or intermittent water, and areas of human concentration or habitation) would be treated initially with non-chemical alternatives. Chemical treatments may be applied if non-chemical alternatives provide inadequate control.
7. Applicants for rights-of-way, other land use authorizations, and recreation permits on BLM public lands would be responsible for noxious weed prevention and control as a condition of the right-of-way, land use authorization, or permit (see *Attachment 5: Standard Operating Procedures - Land Tenure and Access*, #9, p. 110).

*For additional RMP decisions regarding management of noxious weeds, also see Attachment 5: Standard Operating Procedures - Noxious Weeds, pp. 110-111.*

## Off-highway Vehicle Use

**Goal 1:** Provide opportunities for off-highway vehicle (OHV) use (see *Glossary*, p. 178), while limiting OHV use in areas where that use would cause degradation to other resources' values.

**Rationale:** Federal regulations require the BLM to designate all public lands as either open, limited, or closed to off-highway vehicle use (see *Glossary*: off-highway vehicle use designations, p. 178).

1. (a) Unless an area has an expanded limitation or is designated as "closed" to OHV use (see Goal 1, #2-7 below), off-highway vehicle (OHV) use throughout the Challis Resource Area would be designated as "limited" to existing roads, vehicle ways, and trails yearlong (see *Glossary*: "existing roads, vehicle ways, and trails," p. 172 and "off-highway vehicle use designations," p. 178; also see *Map 33: OHV Use*). (**Note:** Any newly constructed road, trail, or parking area authorized by the BLM during the life of the RMP would be considered an "existing" road or trail.)
- (b) Except for in existing WSAs (see Goal 1, #3a below), all OHV limitations within the Resource Area (Goal 1, #1, 2b, 3c, 4, and 6) would allow motorized vehicle travel away from existing roads, vehicle ways, and trails under the following circumstances:
  - (1) within 1/4 mile of existing roads, vehicle ways, and trails to retrieve downed big game;
  - (2) within 100 feet of existing roads, vehicle ways, and trails for direct access to campsites or to cut firewood;
  - (3) immediately adjacent to roads, vehicle ways, and trails for purposes such as parking, turning around, or passing another vehicle; and
  - (4) if the vehicle weighs 1,500 pounds or less GVW and is traveling on at least six inches of continuous snow cover.
- (c) Except for in existing WSAs (see Goal 1, #3a below), temporary exceptions would be authorized to the limitations and closures listed in Goal 1, #1-7 for
  - (1) any military, fire, emergency, or law enforcement vehicle while it is being used for emergency purposes,
  - (2) any vehicle in official use, and
  - (3) any vehicle whose use is expressly authorized in writing by the authorized officer.
2. The following OHV closures or limitations for the protection of ACEC values would be exceptions to the RA-wide limitation described in Goal 1, #1 above:
  - (a) These ACECs would be designated "closed" to OHV use:
    - (1) Lone Bird ACEC (also see ACECs, Lone Bird ACEC, #2, p. 35)
    - (2) East Fork Salmon River Bench ACEC
    - (3) Sand Hollow ACEC

- (b) These ACECs would be designated "limited" to OHV use, with "limitations" described in (1) through (4) below (see *Map 33: OHV Use*) (**Note:** the provisions of #1(b) and (c) above would apply):
- (1) *Malm Gulch/Germer Basin ACEC:* To reduce the hazard of erosion, motorized vehicle use in the Malm Gulch/Germer Basin ACEC would be limited to the existing road from Highway 93 to a point of closure in the NW 1/4, Section 28, T12N, R19E. See *Map 12: ACECs - Malm Gulch/Germer Basin ACEC*.
  - (2) *Summit Creek ACEC:* Motorized travel in the Summit Creek ACEC would be limited to the Howe-May Road, the area south of the existing campground road, and the access route to Barney Hot Springs. See *Map 8: ACECs - Summit Creek ACEC/RNA and Donkey Hills ACEC*.
  - (3) *Herd Creek Watershed ACEC:* The existing trail below Herd Lake and road above Herd Lake would be designated "closed" to OHV use and maintained as trails for non-motorized use only. Motorized vehicle use in the remainder of the Herd Creek Watershed ACEC would be limited to existing roads and vehicle ways. See *Map 10: ACECs - Herd Creek Watershed ACEC/RNA*.
  - (4) *Birch Creek ACEC; Donkey Hills ACEC:* Motorized vehicle travel in the Birch Creek ACEC and Donkey Hills ACEC would be prohibited during the winter/spring period between December 16 and April 30, inclusive, and limited to existing roads, vehicle ways and trails between May 1 and December 15, inclusive. (**Note:** Access to private lands in the Donkey Hills ACEC would be accommodated.) See *Map 6: ACECs - Birch Creek ACEC* and *Map 8: ACECs - Summit Creek ACEC/RNA and Donkey Hills ACEC*.
3. The following OHV closures or limitations in WSAs and WSAs if released from wilderness review would be exceptions to the RA-wide limitation described in Goal 1, #1 above (see *Map 33: OHV Use* and *Map 42: Wilderness Study Areas*):
- (a) *Designated WSAs:* Except for the road closures stated below, OHV use in WSAs would be limited to roads, vehicle ways, and trails that were identified in the Idaho Intensive Wilderness Final Inventory (November 1980).
    - (1) In the Burnt Creek WSA the Dry Creek Road would be closed to motorized vehicle use in the N 1/2, Sec. 1, T9N, R24E for safety reasons and to maintain primitive values (see *Map 44: WSAs - Burnt Creek WSA*).
    - (2) In the Jerry Peak WSA, the existing trail below Herd Lake and road above Herd Lake would be closed to motorized vehicle use to maintain primitive values, and maintained as trails for non-motorized use only (see *Map 47: WSAs - Jerry Peak and Corral-Horse Basin WSAs*).
- Any non-emergency motorized vehicle use off of existing roads, vehicle ways, and trails in a WSA must (a) be specifically authorized by the BLM prior to use and (b) satisfy nonimpairment criteria (Interim Management Policy for Lands Under

Wilderness Review, Manual H-8550-1 (7/95), page 15).

(b) WSAs if Released: Except for the road closures stated below, OHV use in WSAs if released from wilderness review would be limited to roads, vehicle ways, and trails that were identified in the Idaho Intensive Wilderness Final Inventory (November 1980).

(1) In the Burnt Creek WSA the Dry Creek Road would be closed to motorized vehicle use in the N 1/2, Sec. 1, T9N, R24E for safety reasons and to maintain primitive values (see *Map 44: WSAs - Burnt Creek WSA*).

(2) In the Jerry Peak WSA, the existing trail below Herd Lake and road above Herd Lake would be closed to motorized vehicle use to maintain primitive values, and maintained as trails for non-motorized use only (see *Map 47: WSAs - Jerry Peak and Corral-Horse Basin WSAs*).

(**Note:** The provisions stated in Goal 1, #1(b) and (c) above would apply in WSAs if released from wilderness review.)

4. OHV use in the following areas would be designated as "limited" to protect wildlife values, with the limitations as follows: Motorized vehicle travel would be prohibited during the winter/spring period between December 16 and April 30, inclusive. Motorized vehicle travel would be restricted to existing roads, vehicle ways, and trails between May 1 and December 15, inclusive. See *Map 33: OHV Use*.

- (a) Old Stage Road
- (b) Carlson Hills (4,200 acres)
- (c) Willow Creek Summit elk winter range
- (d) Donkey Hills ACEC
- (e) Birch Creek ACEC
- (f) Second Spring Basin

5. The Lone Bird ACEC and the upper 1/2-mile of Devil Canyon Road would be designated as "closed" to OHV use yearlong to protect cultural resources. Physically close the upper 1/2-mile of Devil Canyon Road. Physically close the existing road in the Lone Bird ACEC from the NE 1/4, NE 1/4, Section 13, T12N, R19E to the NW 1/4, SE 1/4, Section 19, T12N, R20E to prevent unauthorized use. (See *Map 33: OHV Use* and *Map 11: ACECs - Lone Bird ACEC*.)

6. The Bluett Creek Road, French Creek Road, and Shay Line Trestle would be designated as "limited" to motorized vehicle use based on vehicle size: allow motorized vehicles weighing 1,500 pounds or less and 50 inches in width or narrower (see *Map 33: OHV Use*).

7. Prohibit organized OHV events in wild horse winter ranges (see *Map 48: Wild Horses*).

## **Paleontological Resources**

**Goal 1:** Identify and manage paleontological resources for scientific research and educational and recreational use.

**Rationale:** The BLM is required to protect paleontological resources under the Federal Land Policy and Management Act and the National Environmental Policy Act.

1. Manage paleontological resources to protect specimens and maintain or enhance sites or areas for their scientific and educational values. Formally inventory paleontological resources to document the variety, significance, and potential of values. Identify and consider paleontological resource concerns when conducting a watershed assessment or when developing or revising activity plans (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103). Focus the paleontological resources program on identification, preservation, mitigation, and public awareness.
2. Promote research under permit to document localities and their significance.
3. Retain public lands containing significant paleontological resources on a case-by-case basis.
4. Implement protective measures at significant paleontological localities that are threatened.
5. Continue to manage the Malm Gulch/Germer Basin ACEC for paleontological values (see ACECs - Malm Gulch/Germer Basin ACEC, p. 36 and *Map 12: ACECs - Malm Gulch/Germer Basin ACEC*).
6. Protect significant paleontological localities by not identifying their specific location or otherwise promoting public use of the resource.

## Rangeland Vegetation Treatment Projects

**Goal 1:** Design rangeland vegetation treatment projects (burns, seedings, etc.) to achieve specific activity planning objectives, reduce impacts to other resources, and increase long term cost-effectiveness.

**Rationale:** Properly designed rangeland vegetation treatments will meet multiple-use management objectives and provide multiple-use benefits. Vegetation treatments are one of the most expensive and time-consuming types of range improvement projects to implement. Cost-effectiveness, potential adverse effects on other resources, and short project life-span make treatment projects highly controversial. Procedures are proposed to address these concerns.

1. Priority and need for proposed rangeland vegetation treatment projects would be evaluated by an interdisciplinary planning team.
2. Objectives and design requirements for rangeland vegetation treatment projects would normally be established by an ID team during development or revision of activity plans. However, for vegetation treatment projects proposed in areas managed under existing activity plans that lack vegetation treatment project objectives, these objectives would be developed as part of vegetation treatment project planning. For vegetation treatments proposed in areas where cheatgrass invasion is potentially high, an ID team would physically examine the site to specifically analyze the risk of cheatgrass invasion prior to finalizing the project proposal.
3. Proposed vegetation treatment projects would be designed by an interdisciplinary planning team and coordinated with the IDFG. Notification of the proposed project would be provided to the IDFG one year in advance of implementation, as required by the current IDFG/BLM MOU.
4. Determine specific establishment success standards for vegetation treatments (*e.g.*, vigor; productivity standards) during project planning. Standards would be met before grazing is allowed in the treated area.
5. Reduce livestock use on the allotment while the vegetation treatment is being established, proportionate to the amount of suitable acres removed from use during establishment.
6. To assure a long term return on the investment, a post-treatment management plan for the treated area which includes appropriate utilization levels and plant composition would be approved before the treatment is conducted.
7. Post-treatment increases in allotment preference may be authorized if allotment objectives have been met on the remainder of the allotment, as determined by an ID team through allotment analysis. Permanent increases in livestock preference resulting from vegetation treatments would be based on the increase in forage production and changes in plant composition, as measured by pre- and post-treatment production studies.

## Recreation Opportunities and Visitor Use

**Goal 1:** Protect the unique recreation values of the following areas:

1. Upper Salmon River SRMA
2. Upper Big Lost River SRMA
3. Mackay Reservoir SRMA
4. sites along Highway 93

**Rationale:** The Main Salmon River and East Fork Salmon River attract and concentrate substantial numbers of recreationists. The BLM's Idaho Recreation 2000 Plan (May, 1989) calls for special management of the **Upper Salmon River**. The outstanding opportunities for river recreation, ease of access, international name recognition, and proximity of the area to other prominent recreation centers logically points toward increased popularity.

The **Upper Big Lost River** recreational use situation mirrors the Upper Salmon River situation, on a smaller scale. Current and projected recreation popularity warrant special management for the area. The Big Lost River corridor has become a major travel route connecting Highway 93 and the Ketchum and Sun Valley, Idaho area.

**Highway 93** (between Challis and Mackay) is a major route into the Upper Salmon River country as well as the Sun Valley area. Numerous recreationists travel the route for the scenery and wildlife-viewing opportunities. Recreation and interpretive facilities along this route are inadequate to accommodate current numbers of travelers.

### Management Decisions Common to All SRMAs:

1. Manage the BLM tracts adjacent to Mackay Reservoir and along the Main Salmon River and the East Fork Salmon River as Special Recreation Management Areas (SRMAs). Designate the BLM tracts along the upper Big Lost River from the Forest Service boundary to the Bartlett bridge as an SRMA (see *Map 40: SRMAs*).
2. Developed recreation sites within the SRMAs would include the Cottonwood, Deadman Hole, Bayhorse, Eastfork, Mackay, Garden Creek, and Little Boulder campgrounds. Recreation sites located on public lands, but managed by the IDFG, would include the Ellis and Deer Gulch campgrounds. No semi-developed recreation sites would be provided in the SRMAs.
3. Manage casual use areas as follows:
  - (a) Improve facilities in existing casual use areas in riparian zones to provide developed day use areas in riparian zones (not including campgrounds) as follows: up to 4 along the Salmon River and up to 2 along the Big Lost River. All other casual use areas in riparian zones would be closed to motorized vehicle use and rehabilitated within five years.
  - (b) Pullout areas and trails could be provided to allow for continued access to the Salmon River and Big Lost River.

- (c) Non-riparian casual use areas would be developed into day-use areas or closed on a case-by-case basis in accordance with the corresponding activity plan.
- 4. Provide at least vault toilets and stabilized parking areas at Jimmy Smith Lake Trailhead, Dugway (Wood Creek Recreation Site), and Challis Bridge (Round Valley Recreation Site).
- 5. Wherever feasible, incorporate river access facilities for floatboating and fishing into new and existing day-use and campground developments.
- 6. Provide trash disposal facilities as necessary. Where no trash disposal facilities are provided, people would be required to pack out their own trash. Follow approved methods for waste disposal shown in *Attachment 19*, p. 154.
- 7. Recreation facilities within SRMAs would be designed to blend with the existing scenery to reduce visual impacts.
- 8. Exclude livestock from the portions of developed recreation sites (see *Glossary*, p. 170) which receive intensive use and are listed below, as well as appropriate portions of recreation sites developed in the future.

Mackay Reservoir  
Pinto Creek Recreation Site (Garden Creek)  
Upper East Fork Campground (Little Boulder Creek)  
Jimmy Smith Lake Campground  
East Fork Recreation Site  
Summit Creek Recreation Site  
Bayhorse Creek Recreation Site  
Deadman Hole Recreation Site  
Wood Creek Recreation Site (Dugway)  
Round Valley Recreation Site (Challis Bridge)  
Morgan Creek Recreation Site  
Herd Lake Campground  
Herd Lake Overlook  
Bison Jump Recreation Site  
Cottonwood Recreation Site

- 9. (a) Prohibit firewood cutting and firewood gathering within designated recreation sites (see *Glossary*: firewood cutting, firewood gathering, p. 172).
- (b) Firewood cutting permits for standing trees would be denied within SRMAs, except where tree cutting (see *Glossary*, p. 184 meets the objectives stated in Forest Resources, Goal 1, #24, p. 52. Firewood gathering within SRMAs would be limited to dead-and-down material.

Also see Forest Resources, Goal 1, #13, p. 51.

10. Limit motorized vehicle travel within SRMAs to existing roads, vehicle ways, and trails, unless additional closures or limitations apply (see OHV Use, Goal 1, #1-7, pp. 68-71; *Glossary*: off-highway vehicle use designations, p. 178; and *Map 40: SRMAs*.)
11. Minerals activities in campgrounds, recreation sites, and SRMAs would be allowed or restricted as shown in Minerals, Goal 1, #2 and 3, Goal 2, #2 and 3, and Goal 3, #2 (see pp. 64-66).

Management Applying to the Recreation Area(s) Indicated in Each Decision:

12. Revise the existing Upper Salmon River Recreation Area Management Plan (RAMP) within three years, reflecting the addition of the East Fork Salmon River tracts (see *Map 40: SRMAs* and *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103).
13. Management of the Upper Salmon River SRMA would be coordinated with the U. S. Forest Service, the State of Idaho, Custer County, and adjacent private landowners.
14. The Upper Big Lost River SRMA would be managed according to an activity plan developed within two years to emphasize developed camping and river recreation. The activity plan would be completed before any site planning. (See *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103.)
15. Revise the existing Mackay Reservoir RAMP within four years (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103).
16. Develop facilities, including interpretive displays, in the Chilly Slough Wetlands Conservation Project area to enhance recreational opportunities for wildlife watching, photography, fishing, and hunting. Design facilities to minimize impacts to wetland and wildlife values and otherwise be compatible with wetland and wildlife objectives developed for the project area. (See *Attachment 11: Summary of the Chilly Slough Wetland Conservation Project*, p. 144)

**Goal 2:** Provide a variety of interpretive services which highlight the natural, cultural, and historical features of the Challis Resource Area.

**Rationale:** Interpretation enhances the quality of recreation opportunities provided on public lands.

1. Develop a comprehensive interpretive plan for the three SRMAs. Interpretive media such as brochures, maps, pamphlets, guidebooks, etc. would be designed and developed to enhance the recreational experience of the public. In addition, materials for self-guided tours of historic areas, geology and natural history kiosks, evening presentations in campgrounds, etc. would be considered in the interpretive plan.
2. Interpretive needs within the SRMAs would be met primarily through interpretive waysides and roadside signing.

3. Coordinate interpretive efforts in the BLM-managed portion of the Land of the Yankee Fork Historic Area with the Idaho Department of Parks and Recreation and the U. S. Forest Service. The BLM would consider staffing assistance at the Land of the Yankee Fork visitor center.
4. Consider the Whiskey Springs site for an interpretive wayside to emphasize the area's wildlife values.
5. Opportunities for wildlife viewing would be enhanced primarily along the roads and highways within the SRMAs.
6. Prohibit all non-interpretive signing (e.g., advertising, political signs, etc.) on public lands.
7. Provide a public viewing area for wild horse observations.

For RMP management decisions relating to public awareness of cultural resources, *also see* Cultural Resources, Goal 2, #1-4, pp. 42-43.

**Goal 3:** Provide recreation opportunities for the remainder of the Resource Area not included in an SRMA, including areas specifically for unstructured outdoor experiences, trails (e.g., hiking, horseback riding, bicycling), recreational mineral collecting, and OHV use.

**Rationale:** The BLM manual requires the establishment of Extensive Recreation Management Areas (ERMAs) during the RMP process.

1. Those portions of the RA not designated as an SRMA would be managed as the Challis Extensive Recreation Management Area (ERMA) (see *Map 40: SRMAs*).
2. Complete a comprehensive inventory of use patterns, demands, and impacts within the ERMA within 10 years. Whenever feasible, this inventory would be conducted as a cooperative effort between the BLM and the adjoining National Forests.
3. Continue to provide day-use facilities at Herd Lake Overlook and Summit Creek. Provide semi-developed recreation sites at Summit Creek (see ACECs, Summit Creek ACEC, #3, p. 38), First Creek Crossing, and Big Creek. Close the Upper Lake Creek campground and maintain the existing road above Herd Lake as a non-motorized trail only (see OHV Use, Goal 1, #3(a)(2) and 3(b)(2), pp. 70-71).
4. Within ten years develop an activity management plan for backcountry use to address the various dispersed recreation opportunities (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103). If possible, develop this plan in cooperation with the adjoining National Forests.
5. Develop and maintain one new backcountry trail in the ERMA within 10 years, primarily for use by mountain bikers and horseback riders.

**Goal 4:** Enhance recreational opportunities through designation of additional existing roads into the BLM National Backcountry Byways program.

**Rationale:** The BLM Manual requires that Backcountry Byways be addressed through the planning process.

1. Recommend a loop drive for inclusion in the National Backcountry Byways system: Wild Horse Backcountry Byway. The route would go over Spar Canyon Road, along Highway 93 from the end of Spar Canyon Road to the Dry Gulch Road, continue on Dry Gulch Road to Walker Way, follow Walker Way and Road Creek to the East Fork Road, and the East Fork Road back to Spar Canyon. Also study the following roads for inclusion in the National Backcountry Byways system: Double Springs Road, Garden Creek Road, Morgan Creek Road, and Trail Creek Road.

**Goal 5:** Examine the potential for significant caves in the Resource Area. Protect significant caves via the activity plan process.

**Rationale:** Legal and manual guidance require that caves be addressed in the planning process and important cave resources be protected.

1. In cooperation with local and regional caving groups, conduct an intensive Resource Area-wide inventory of existing caves, determine the significance of identified caves, and recommend protective measures.

## Riparian Areas

**Goal 1:** Manage stream riparian areas to maintain or achieve proper functioning condition (see *Attachment 1: Riparian-Wetland Area Function Classification*, pp. 101-102) to ensure desired functions, improve water quality, prevent and minimize flood and sediment damage, and establish conditions which support attainment of healthy and productive aquatic habitat. Maintain proper functioning condition stream riparian areas (currently 35.8%, based on the most recent riparian functionality assessments) and restore functional-at-risk and non-functional stream riparian areas so that 75 percent or more of stream riparian areas are in proper functioning condition or making progress toward proper functioning condition within five years. Maintain proper functioning condition stream riparian areas and restore functional-at-risk and non-functional stream riparian areas so that 90 percent of riparian areas on fish-bearing streams are in proper functioning condition or making progress toward proper functioning condition by 2010.

**Rationale:** Required by the Clean Water Act and BLM policy.

1. All new Challis Resource Area activity plans, agreements, or other resource planning documents proposing or modifying resource management actions would incorporate knowledgeable and reasonable practices (see *Glossary*, p. 175) to maintain water quality, support beneficial uses, and restore and maintain riparian areas. When appropriate, follow *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103. The approach described in *Attachment 12: Procedure for Nonpoint Source Consistency Review* (pp. 145-146) would be utilized in these documents to ensure consistency and compliance with the Idaho Nonpoint Source Management Program.
2. Review existing activity plans and revise them as appropriate, in order to address riparian concerns within the Resource Area (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103). Priority for activity plan review and revision would be given to those watersheds with special status fish species concerns.
3. An ID team would select a riparian monitoring site within each pasture containing a perennial stream or appropriate portion of an intermittent stream, to measure progress toward meeting riparian objectives.
4. Knowledgeable and reasonable practices (see *Glossary*, p. 175) to manage livestock grazing would be used to improve riparian areas and meet resource objectives on perennial and intermittent streams. The herbaceous stubble height and bank shearing standards listed in #5 and 6 below would be the primary knowledgeable and reasonable practices used to manage livestock on most streams. When appropriate and available, alternative knowledgeable and reasonable practices may be implemented in lieu of the standards in #5 and 6 below, provided that the alternative practices are based on the following: (1) current scientific literature or other applicable study results which substantiate that riparian improvement would result from implementing the practice(s); (2) the recommendations of an ID team responsible for reviewing, interpreting, and documenting the scientific literature or study results upon which the knowledgeable and reasonable practice is based; and (3) completion of an environmental assessment documenting how the knowledgeable and reasonable practice would meet riparian resource objectives.

5. Use the following herbaceous stubble height criteria to manage livestock grazing in riparian areas on all perennial and appropriate portions of intermittent streams, in order to make progress toward achieving and maintaining proper functioning condition.
  - (a) Manage livestock use on streams in either proper functioning condition or functional-at-risk condition with an upward trend (see *Attachment 1: Riparian-Wetland Area Function Classification*, pp. 101-102) to maintain a minimum four-inch median stubble height during the scheduled grazing period.
  - (b) Manage livestock use on streams in either functional-at-risk condition with a static or downward trend or nonfunctional condition (see *Attachment 1: Riparian-Wetland Area Function Classification*, pp. 101-102) to maintain a minimum six-inch median stubble height during the scheduled grazing period.
  - (c) Stubble height criteria may be less than stated in #5a and 5b above in pastures used prior to July 10 if an ID team determines that sufficient regrowth is expected to meet the criteria by the end of the growing season. In pastures used after July 10, remove livestock from perennial and appropriate portions of intermittent stream riparian areas prior to exceeding the applied stubble height criteria. (See *Attachment 3: Component Practices for Grazing Management in Lieu of BMPs*, p. 104)
6. Use the following bank-shearing criteria to manage livestock grazing in riparian areas on all perennial and appropriate portions of intermittent streams, in order to make progress toward achieving and maintaining proper functioning condition.
  - (a) On streams which are occupied habitat for special status fish species, manage livestock so that no more than 10% of the streambank is sheared by livestock hoof action.
  - (b) On perennial streams and appropriate portions of intermittent streams which are not occupied habitat for special status fish species, manage livestock so that no more than 20% of the streambank is sheared by livestock hoof action.

These standards for bank shearing may be altered on a case-by-case basis when a watershed or site-specific assessment conducted by an ID team indicates alternative conditions are more appropriate. Rationale for changes to the bank shearing standard must be properly documented.

7. Manage livestock grazing in riparian areas according to the decisions stated in Riparian Areas, Goal 1, #4-6 above. Periodically evaluate riparian habitat condition. Implement further adjustments in livestock use and management (e.g., rest, reduced livestock numbers, changed season of use) if trend or other monitoring data indicate riparian improvement is not sufficient to meet riparian resource objectives.
8. Continue existing management (including periodic grazing) of the Anderson Ranch riparian pasture to ensure progress toward the riparian and aquatic habitat conditions described in *Attachment 15* (see p. 149).

9. Develop riparian pastures and riparian study exclosures throughout the Resource Area where an ID team identifies the opportunity.
10. Elicit support and cooperation to develop an allotment-scale grazing management demonstration project on a perennial watershed.
11. To restore degraded riparian/aquatic habitat conditions, technical approaches for riparian/aquatic improvement (*e.g.*, plantings, structures) (see *Glossary*, p. 184) may be implemented on sites that are not responding, and are not expected to respond, to proper grazing management.
12. Roads would not be constructed in riparian zones, except for stream crossing needs and recreation site development. Roads constructed would, as a minimum, meet all standards listed in Transportation, Goal 1, #9, p. 85.

*For additional RMP decisions regarding management of resources and land uses in riparian areas, also see* Forest Resources, Goal 1, #13, 15, 16, 17, and 24 (pp. 51-52), Livestock Grazing, Goal 1, #4, 6, and 11 (pp. 60-61); Minerals, Goal 1, #6, Goal 2, #6, and Goal 3, #5 (pp. 64 and 66); and Recreation Opportunities and Visitor Use, Goal 1 (pp. 74-76).

**Goal 2:** Increase knowledge and understanding of riparian resources to improve the effectiveness of riparian management.

**Rationale:** Information on trend and condition for many streams in the Resource Area is lacking. BLM policy requires information on riparian condition and trend to be obtained.

1. Determine which perennial streams currently support State designated and BLM identified beneficial uses, through riparian status inventory and stream function assessment (see *Attachment 23: Beneficial Use Classifications for Drainage Segments*, pp. 159-163).
2. Maintain existing riparian exclosures to provide reference areas for management assessment. Continue to monitor changes within the exclosures.
3. To determine riparian potential, within 10 years establish and monitor fenced riparian study areas on perennial stream segments as described in *Attachment 13: Riparian Study Area Development*, p. 147. Establish a riparian study exclosure on each riparian site type comprising at least 10% of the riparian area in each principal drainage shown on *Map 25: Geography and Principal Drainage Basins*. Use these exclosures to collect baseline riparian information which can be applied to like site types within the drainage. Establish additional exclosures within a drainage as needed to help resolve resource conflicts.

**Goal 3:** Manage for a "no net loss" of riparian and floodplain habitat.

**Rationale:** Riparian areas, as one of the most desirable and valuable areas on the landscape, are often the site of inadvertent trespass. Loss of these areas in the resolution of trespass cases incrementally erodes the amount of this habitat type in public ownership. Such a loss represents lost opportunities for wildlife, recreation, fisheries, and biodiversity.

1. Follow a "no net loss" policy of like riparian values (*e.g.* cottonwood galleries, forest wetlands, perennial streams) and floodplain habitat on individual exchanges when conducting land tenure adjustments (see Land Tenure and Access, Goal 1, #3, p. 54).

**Goal 4:** Increase public awareness of the value of good condition, functional riparian and wetland areas.

**Rationale:** Many persons do not understand the functional value of a good condition riparian area. Required by the BLM's *Riparian-Wetland Initiative for the 1990's* (September 1991).

1. Initiate public education efforts to improve public understanding of, and appreciation for, riparian and wetland areas.
2. Riparian demonstration areas, exclosures, and other study sites would be showcased and used for educational and scientific purposes.
3. Provide interpretive facilities at the Chilly Slough wetland to highlight wetland values. Design recreational facilities developed at the Chilly Slough wetland to minimize impacts to wetland values (also see Recreation Opportunities and Visitor Use, Goal 1, #16, p. 76).

## Special Status Species

*\*Note: This section primarily discusses special status plant and animal species. Special status fish species are also discussed under Fisheries, Goal 1, pp. 45-47.*

**Goal 1:** Increase the knowledge of the distribution and abundance of special status species (see *Glossary*, p. 183) in the Challis Resource Area.

**Rationale:** The distribution and abundance of rare species in the Resource Area is poorly known.

1. Conduct field inventories for special status plant species at the rate of about 3,000 acres per year.
2. Conduct annual interagency surveys of wintering bald eagles.
3. At least once every five years, inventory cliff sites for possible use by endangered peregrine falcons.
4. Conduct field inventories for special status animal species at the rate of about 4,000 acres per year.
5. Within five years, develop species data files for sensitive amphibians, reptiles, insects, and non-vascular plants (based on literature searches and expert input) that may potentially occur in the Resource Area. Within ten years, conduct field inventories of these species' potential habitats.

**Goal 2:** Maintain populations of special status species and/or their habitat over the range of natural distribution and habitat conditions. Eliminate the need for listing of sensitive and candidate species and contribute to recovery of listed species by increasing the number or size of populations or by removing threats to species and their habitats.

**Rationale:** BLM policy is to manage special status species to maintain viable populations, to manage sensitive and candidate species in a manner that eliminates the need for listing under the Endangered Species Act, and to manage listed species for recovery.

1. Include a site-specific field assessment of special status plant, animal, and fish species as part of the assessment of all authorized actions.
2. Activity planning, project implementation, and settlements of unauthorized use would promote mitigation of adverse effects on special status species. Where adverse effects cannot be mitigated (other than for Federally listed threatened or endangered species), the cumulative effects of such actions would be monitored and assessed.

3. As additional information on amphibians, reptiles, invertebrates, and non-vascular plants becomes available, include analysis of these life forms when assessing the effects of authorized actions.
4. Develop BLM Species Management Plans or other types of conservation plans for special status plant species within 5 years. Strategies would be developed to (a) maintain or increase the population size of all known populations of the alkaline primrose; and (b) maintain habitat for at least 70% of the populations of the wavy leaf thelypody in the Resource Area. Coordinate with the USFWS to determine which populations of wavy leaf thelypody can be impacted without threat to the species.
5. Within 10 years, develop BLM Species Management Plans or other types of conservation plans for at least five of the species inventoried under Special Status Species, Goal 1, #4 and 5 above.
6. Develop cost-share partnerships with academic institutions and conservation groups to promote population recovery, management, and study of all special status species.

*For additional RMP decisions regarding management of special status species, also see ACECs - "Management Common to All ACECs" and Dry Gulch, Herd Creek Watershed, Malm Gulch/Germer Basin, Pennal Gulch, Sand Hollow, and Summit Creek ACECs, pp. 29-30 and 33-39; and "General" standard operating procedures #3-5 (Attachment 5: SOPs, p. 107).*

---

## **Transportation**

**Goal 1:** Consistent with other resource objectives and values, provide an adequate road and trail system on the Challis Resource Area's public lands to (a) satisfy the public need for recreation, commodity production, access, and safety, and (b) facilitate management of BLM resources and programs.

**Rationale:** An adequate road and trail system is needed to meet public demand for access and use of the public lands. BLM roads and trails provide the final link in the network of interstate, state, and county roads developed to meet public transportation needs.

1. Within five years, develop a transportation plan for the Resource Area using an ID team planning process (see *Glossary*, p. 174) to identify (a) roads or trails which are extraneous and could be closed; (b) roads needing improvement to meet public safety, recreation, resource and program management, public access, and commodity production needs; (c) guidance for maintenance; (d) miles of roads or trails which may need to be constructed; and (e) other transportation management guidance which may be necessary. See *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103.

2. Through the ID team planning process, a long term road maintenance plan which includes the level and frequency of maintenance for each BLM road and trail (see *Map 22: Existing Maintained Roads*) would be developed, reviewed, and modified as needed (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103). BLM guidance which sets criteria for road maintenance levels would be followed (see *Attachment 20*, p. 155). The road maintenance plan would be reviewed annually by appropriate staff specialists and modified as necessary to avoid conflicts with special status species, cultural resources, and other resources.
3. Unless modified by the road maintenance plan described in Goal 1, #2 above, the BLM roads and trails currently identified for Level 3 maintenance (see *Map 35: Road and Trail Maintenance Priorities*) would receive regular maintenance as needed. All other roads and trails would be maintained as described in Goal 1, #4 and 5 below.
4. In order to limit unnecessary surface disturbance and maintain primitive values, BLM roads and trails identified for Level 2 maintenance would only receive maintenance work as needed to (a) ensure public safety, (b) repair resource damage caused by high runoff events, or (c) control erosion at drainage crossings.
5. BLM roads and trails identified for Level 1 maintenance would only be maintained to provide access for emergency cases, such as a large wildfire.
6. No new roads would be constructed in riparian areas, except for stream crossing needs and recreation site development.
7. All future roads, stock trails, and recreational trails would be located, designed, constructed, and drainage-controlled so that erosion on the roadbed and cut and fill slopes would not hinder progress toward supporting water quality beneficial uses or attaining riparian management objectives (see Upland Watershed, Goal 1, #10, p. 88).
8. Existing roads would be inventoried and, on a case-by-case basis, modified, relocated, or closed and rehabilitated to meet water quality standards and support State designated and BLM identified beneficial uses (see *Attachment 23*, pp. 159-163) of adjacent streams, beginning with those streams containing salmon, steelhead trout, or bull trout habitat.
9. BLM roads and trails would be constructed and maintained to (a) meet or exceed State approved BMPs for road construction and maintenance, (b) ensure progress toward the riparian and aquatic habitat conditions described in *Attachment 15*, p. 149 and (c) follow "General" design specification #1 (see *Attachment 8*, p. 120).

*For additional decisions relating to transportation and access, also see the following sections of the PRMP: Forest Resources, Goal 1, #15, 16, 17, 18, 23, pp. 51-52; Hazardous Materials Management, Goal 1, #2, p. 53; Land Tenure and Access, Goal 5, #1 and 2, p. 58; OHV Use, Goal 1, #1-7, pp. 69-71; Recreation Opportunities and Visitor Use, Goal 4, #1, p. 78; and Design Specifications - "General" #1 and "Forest Management - Road Construction" (Attachment 8, pp. 120 and 122).*

## **Tribal Treaty Rights**

**Goal 1:** Identify and consider Native American issues and concerns in order to accommodate treaty and other legal rights of appropriate Native American groups in the multiple-use management of public lands.

**Rationale:** The Federal government has a trust responsibility to Native American tribes in the management of public lands as provided for through various negotiated treaties. Several laws, including FLPMA, require the BLM to coordinate with Federally recognized Indian tribes about impacts to Indian trust resources which may result from BLM plans, projects, programs, or activities.

1. Notify and consult appropriate Native American tribes to ensure that all anticipated effects to Indian trust resources are addressed in the planning, decision, and operational documents prepared for each proposed BLM action. Consultation and coordination would be conducted on a government-to-government basis with Federally recognized tribes. Types of proposed actions which would require consultation would include, but not be limited to, range practices and management, wildlife habitat management, fisheries habitat management, land tenure actions or permits, forest resources management, and minerals exploration or development. In some cases, give priority consideration to enhancement of resources used by Native American tribes under treaty.

The following RMP management decisions relate to tribal treaty rights because they either (a) specifically discuss management of trust resources to facilitate pursuit of tribal treaty rights or (b) provide for consultation with Federally recognized tribes regarding management of various trust resources, such as wildlife and fish.

**Fisheries:** Goal 1, #6, 11, 13, and 15, pp. 46-47.

**Forest Resources:** Goal 1, #11, 18 and 19, pp. 51-52.

**Land Tenure:** Goal 1, #2 and 10, p. 54; Goal 3, #7, p. 57; and Goal 5 statement, p. 58.

**Livestock Grazing:** Goal 1, #15, p. 61.

**Minerals:** "Decisions Which Apply to All Types of Mineral Development," #3, p. 63.

**Wildlife Habitat:** Goal 2, # 10, p. 97; and Goal 4, #1, p. 98.

## Upland Watershed

**Goal 1:** Restore and rehabilitate upland watersheds found to be in unsatisfactory condition, and maintain satisfactory condition watersheds (see *Glossary* definition: watershed condition class, p. 186).

**Rationale:** Poor condition upland watersheds contribute to non-functional and functional-at-risk riparian systems and the loss of the soil resource base, do not sustain beneficial physical and ecological processes, and lack functioning recovery systems. Management of watersheds to reduce soil erosion and sediment delivery protects beneficial uses of water and the soil resource base on which all vegetation resources rely. The Clean Water Act requires management of watersheds to protect beneficial uses of water. Upland watershed management is also a BLM policy requirement.

1. Consider the effects of resource use timing and intensity on soil compaction, erosion, and microbiotic soil crusts before new soil disturbing actions (including changes in livestock grazing) are authorized.
2. Where practicable, avoid areas with soils at risk of compaction when designing and planning for activities that concentrate use.
3. Manage all watersheds in the Resource Area to achieve 70% vegetative cover on upland sites as measured prior to grazing, or, for sites not capable of achieving 70% cover, 90% of cover achievable under Potential Natural Community.
4. Additional forage available as a result of seedings, burns, range improvements or projects, etc. would not be allocated on a permanent basis for livestock use (but rather used for watershed protection and other multiple use purposes) until resource management objectives for the allotment are met, as determined by an ID team through allotment analysis. Permanent increases in livestock preference resulting from vegetation treatments would be based on the increase in forage production and changes in plant composition, as measured by pre- and post-treatment production studies.
5. Grazing privileges that are lost, retired, relinquished, canceled, or have base property sold without transfer would have attached AUMs held for watershed protection and wildlife habitat until allotment vegetative objectives are reached. Once vegetative objectives are reached, these AUMs would remain unallocated to any particular livestock permittee, but may be used to provide short term (less than three years) flexibility to permittees for vegetation treatments or other management actions affecting their base permit.
6. Allocate nonuse AUMs to watershed protection, wildlife habitat, plant maintenance, and improvement of ecological condition to meet related allotment objectives. Nonuse AUMs may be authorized for temporary nonrenewable use after an ID team has determined that related allotment objectives are being met.
7. Manage the Garden Creek watershed (Challis municipal water supply) to maintain water quality in Garden Creek.

8. Burned areas and areas disturbed during wildfire suppression may be rehabilitated to meet multiple use objectives when the erosion hazard is high, natural revegetation potential is low, and alternative management practices alone would not facilitate stabilization in a timely manner. An interdisciplinary team would evaluate the need for the project, develop rehabilitation objectives, and design the project. (Also see Fire Management, Goal 1, #8, p. 45.)
9. Artificially stabilize headcuts when it has been determined that alternative management practices alone will not facilitate stabilization in a timely manner and are preventing attainment of desired riparian and aquatic habitat conditions (see *Attachment 15*, p. 149).
10. Manage erosion from mines, roads, and surface disturbing activities to meet State water quality standards, support beneficial uses, and ensure progress toward desired riparian and aquatic habitat conditions (see *Attachment 15*, p. 149 and Water Quality, Goal 1, #1-7, p. 90).
11. Allow only helicopter logging in the Lone Pine Peak area (see *Map C: Suitable Commercial Timberlands*), to protect watershed resources in Lone Pine Creek.

*For additional RMP decisions relating to management of upland watersheds, also see ACECs - Malm Gulch/Germer Basin and Sand Hollow ACECs, pp. 36-38; OHV Use, Goal 1, #1-7, pp. 69-71; Attachment 5: SOPs (pp. 107-112); and Attachment 8: Design Specifications (pp. 120-123).*

---

## **Visual Resources**

**Goal 1:** Maintain or enhance the visual quality of the Resource Area, and prioritize the areas where greater and lesser consideration would be given to surface disturbing activities.

**Rationale:** Consideration of visual quality and the establishment of Visual Resource Management (VRM) areas is required by law and BLM policy.

1. Manage visual resources according to the VRM classes shown on *Map 41: Visual Resource Management* (see Glossary: Visual resource management classes, pp. 185-186). Surface disturbing activities would not exceed the allowable visual intrusion for a given area. Where feasible, additional design techniques would be employed to help projects blend into the scenery.
  - (a) Approximately 142,260 acres would be managed under the provisions of Visual Management Class I.
  - (b) Approximately 557,665 acres would be managed under the provisions of Visual Management Class II.

- (c) Approximately 92,641 acres would be managed under the provisions of Visual Management Class III.
  - (d) Zero acres would be managed under the provisions of Visual Management Class IV.
2. Under the following circumstances, an ID team would consider, and recommend if appropriate, the use of visual simulations and the latest visual design techniques to assess visual quality and visual impacts and ensure that the current VRM Class is maintained or enhanced:
    - (a) project scoping for proposed surface-disturbing projects anywhere in the RA; and
    - (b) project scoping for all proposed actions within a VRM Class I area, a VRM Class II area; or an SRMA.
  3. Within five years, develop a model of visual appeal for landscape features within the SRMAs (see *Map 40: SRMAs*).
  4. In VRM Class I and II areas and anywhere within an SRMA, on-site visual quality control assessments would occur as part of project planning and implementation.
  5. Manage existing WSAs under VRM Class I. The visual quality of WSAs released from wilderness review would be managed under the visual management class of adjacent BLM public lands (see *Map 41: VRM* and *Map 42: WSAs*). Where more than one VRM class lies adjacent to a WSA, an ID team would decide the VRM class of the released WSA.
  6. Allow only helicopter logging in the Lone Pine Peak area (see *Map C: Suitable Commercial Timberlands*), to retain the visual characteristics of the area and protect watershed resources in Lone Pine Creek.
  7. Allow mineral material disposals and non-energy leasing in SRMAs when the actions are determined through the ID team process to be consistent with maintenance of Special Management Area values. To maintain recreational and scenic values in the Upper Salmon River and Upper Big Lost River SRMAs, limit mineral material disposals and non-energy leasing to existing sites and sites not visible from the Salmon River or upper Big Lost River or the following roads: Trail Creek Road, East Fork Road, Highway 75, and Highway 93 South, unless a site-specific scenic quality assessment determines there would be no significant impact to SRMA resources (see *Map 40: SRMAs*).

## Water Quality

**Goal 1:** On perennial streams, improve water quality to fully support those beneficial uses which are not supported, are threatened, or are only partially supported. Maintain fully supported beneficial use status where it exists.

**Rationale:** Required by the Clean Water Act.

1. Determine which perennial streams currently support State designated and BLM identified beneficial uses, through riparian status inventory and stream function assessment (see *Attachment 23: Beneficial Use Classifications for Drainage Segments*, pp. 159-163).
2. Design and conduct land and resource management activities to maintain or improve water quality and support State designated and BLM identified beneficial uses (see *Attachment 23*, pp. 159-163). As necessary, incorporate guidelines for controlling sediment discharge into water bodies into all BLM authorized actions.
3. All BLM authorized actions would meet or exceed State approved BMPs for water quality, to ensure that activities maintain existing good water quality and improve impaired water quality. Utilize the approach described in *Attachment 12* (pp. 145-146) to monitor water quality and ensure consistency and compliance with the Idaho Nonpoint Source Management Program.
4. Water quality would be a management priority and receive special consideration on State identified water quality limited stream segments (see *Glossary*, p. 186 and *Attachment 23: Beneficial Use Classifications for Drainage Segments*, pp. 159-163).
5. All future roads, stock trails, and recreational trails would be located, designed, constructed, and drainage controlled so that erosion on the roadbed and cut and fill slopes would not hinder progress toward supporting water quality beneficial uses or attaining riparian management objectives (see Upland Watershed, Goal 1, #10, p. 88).
6. Existing roads would be inventoried and, on a case-by-case basis, modified, relocated, or closed and rehabilitated to meet water quality standards and support State designated and BLM identified beneficial uses (see *Attachment 23*, pp. 159-163) of adjacent streams, beginning with those streams containing salmon, steelhead trout, or bull trout habitat.
7. Until BMPs for livestock grazing are developed, use the procedures shown in *Attachment 3: Component Practices for Grazing Management in Lieu of BMPs*, p. 104.

*For additional RMP decisions relating to water quality, also see Forest Resources, Goal 1, pp. 49-52; Livestock Grazing, Goal 1, #4, p. 60; Minerals, Goal 1, #6, Goal 2, #6, and Goal 3, #5, pp. 64 and 66; Riparian Areas, Goal 1, pp. 79-81; Upland Watershed, Goal 1, pp. 87-88; Attachment 5: SOPs - Noxious Weeds, pp. 110-111; and Attachment 8: Design Specifications, pp. 120-123*

## Wilderness Study Areas - Management if Released from Wilderness Review

**Goal 1:** Manage Wilderness Study Areas (WSAs) released by Congress from wilderness review for existing values and uses, such as primitive and unconfined recreation, opportunities for solitude, naturalness, roadlessness, livestock grazing, forest resources, and biodiversity.

**Rationale:** WSAs currently managed under the BLM's *Interim Management Policy and Guidelines for Lands under Wilderness Review* (July 5, 1995) may potentially be released by Congress for other multiple-use management purposes.

1. Unless released by Congress from wilderness review, WSAs would continue to be managed in accordance with (a) the BLM's *Interim Management Policy and Guidelines for Lands Under Wilderness Review* (1995) and (b) the 1982 Challis, 1986 Big Lost-Pahsimeroi, and 1989 Statewide Small WSA Plan Amendments. Existing WSAs (see *Map 42: WSAs*) and their acreages recommended by the BLM as suitable or unsuitable for wilderness inclusion are:

Jerry Peak West	13,530 acres unsuitable
Jerry Peak	26,750 acres suitable 19,400 acres unsuitable
Burnt Creek	8,300 acres suitable 16,680 acres unsuitable
Goldburg	3,290 acres unsuitable
Borah Peak	3,880 acres suitable
Corral-Horse Basin	46,500 acres unsuitable
Boulder Creek	1,930 acres unsuitable

Also see *Map 43: WSAs - Goldburg WSA*; *Map 44: WSAs - Burnt Creek WSA*; *Map 45: WSAs - Borah Peak WSA*; *Map 46: WSAs - Jerry Peak West and Boulder Creek WSAs*; and *Map 47: WSAs - Jerry Peak and Corral-Horse Basin WSAs*.

2. If released from wilderness review, resource objectives would be identified during activity planning (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103) to provide for development of range improvement projects, grazing management, primitive recreation, and biodiversity in the WSAs. Other resource values would be managed as described below.
3. The following OHV closures or limitations in WSAs and WSAs if released from wilderness review would be exceptions to the RA-wide limitation described in OHV Use, Goal 1, #1, p. 69 (see *Map 33: OHV Use* and *Map 42: Wilderness Study Areas*):

- (a) Designated WSAs: Except for the road closures stated below, OHV use in WSAs would be limited to roads, vehicle ways, and trails that were identified in the Idaho Intensive Wilderness Final Inventory (November 1980).
- (1) In the Burnt Creek WSA the Dry Creek Road would be closed to motorized vehicle use in the N 1/2, Sec. 1, T9N, R24E for safety reasons and to maintain primitive values (see *Map 44: WSAs - Burnt Creek WSA*).
  - (2) In the Jerry Peak WSA, the existing trail below Herd Lake and road above Herd Lake would be closed to motorized vehicle use to maintain primitive values, and maintained as trails for non-motorized use only (see *Map 47: WSAs - Jerry Peak and Corral-Horse Basin WSAs*).

Any non-emergency motorized vehicle use off of existing roads, vehicle ways, and trails in a WSA must (a) be specifically authorized by the BLM prior to use and (b) satisfy nonimpairment criteria (Interim Management Policy for Lands Under Wilderness Review, Manual H-8550-1 (7/95), page 15).

- (b) WSAs if Released: Except for the road closures stated below, OHV use in WSAs if released from wilderness review would be limited to roads, vehicle ways, and trails that were identified in the Idaho Intensive Wilderness Final Inventory (November 1980).
- (1) In the Burnt Creek WSA the Dry Creek Road would be closed to motorized vehicle use in the N 1/2, Sec. 1, T9N, R24E for safety reasons and to maintain primitive values (see *Map 44: WSAs - Burnt Creek WSA*).
  - (2) In the Jerry Peak WSA, the existing trail below Herd Lake and road above Herd Lake would be closed to motorized vehicle use to maintain primitive values, and maintained as trails for non-motorized use only (see *Map 47: WSAs - Jerry Peak and Corral-Horse Basin WSAs*).

(Note: The provisions stated in OHV Use, Goal 1, #1(b) and (c) (p. 69) would apply in WSAs if released from wilderness review.)

4. No new roads would be constructed in the Jerry Peak, Jerry Peak West, Corral-Horse Basin, and Burnt Creek WSAs if released from wilderness review, except where such construction is necessary to develop mineral or timber resources (as described in #5 and 7 below), and where construction is consistent with other resource management objectives. (See *Map 44: WSAs - Burnt Creek WSA*, *Map 46: WSAs - Jerry Peak West and Boulder Creek WSAs*, and *Map 47: Jerry Peak and Corral-Horse Basin WSAs*.)
5. If released from wilderness review, WSAs would be open to forest management, including commercial timber harvest, with the following limitations and exceptions on commercial timber harvest: (a) In the nonsuitable portions of the Jerry Peak and Corral-Horse Basin WSAs, timber stands more than 1/2-mile from roads existing at the time of RMP approval (see *Glossary: "road,"* p. 181 and "existing roads, vehicle ways, and trails," p. 172) would be available for harvest by helicopter logging only. (b) Suitable portions of the

Jerry Peak WSA if released from wilderness review would remain closed to timber harvest to maintain old growth forest values and biodiversity associated with large undisturbed tracts of forest land. (See *Map C: Suitable Commercial Timberlands* and *Map 47: WSAs - Jerry Peak and Corral-Horse Basin WSAs*.)

6. Mineral development in WSAs released from wilderness review would be allowed or restricted as described in Minerals, Goal 1, #4, Goal 2, #5, and Goal 3, #3 (see pp. 64 and 66).
7. Existing WSAs would be managed under VRM Class I. The visual quality of WSAs released from wilderness review would be managed under the visual resource management class of adjacent BLM public lands. Where more than one VRM class lies adjacent to a WSA, an ID team would decide the VRM class of the released WSA.
8. Public lands within an existing WSA which are identified as adjustment areas for potential disposal (see *Map A: Adjustment/Management Areas*) would be available for potential disposal only if the WSA is released from wilderness review.

---

## Wild Horses and Burros

**Goal 1:** Maintain a viable population (see *Glossary*, p. 185) of wild horses so as to achieve a thriving natural ecological balance in the Herd Management Area.

**Rationale:** Required by the Wild Horse and Burro Act.

1. Manage the wild horse herd for an appropriate management level (see *Glossary*, p. 167) of 185 animals in accordance with the 1985 U. S. District Court Consent Judgement and the current activity plan for the wild horse Herd Management Area. The herd would vary from 185 to about 253 animals between roundups. Adjust horse numbers to a lower level if monitoring data show that the current appropriate management level is causing unacceptable levels of resource degradation (see *Map 48: Wild Horses*).
2. Evaluate new/existing fences on a case-by-case basis to provide for wild horse movement.
3. Monitor wild horse use of the Malm Gulch and Sand Hollow areas, and remove wild horses as necessary to protect fragile watersheds.
4. No portion of the Challis Resource Area would be designated as a Wild Burro Management Area. Remove any burros released in the future.
5. Prohibit organized OHV events in wild horse winter ranges. (See OHV Use, Goal 1, pp. 69-71 for other actions relating to OHV use in the wild horse Herd Management Area.)
6. Provide a public viewing area for wild horse observations.

7. Adjust wild horse management to ensure progress toward the riparian and aquatic habitat conditions described in *Attachment 15* (see p. 149).

For additional RMP decisions relating to wild horse management, **also see** *Attachment 5: Standard Operating Procedures - Wild Horses*, pp. 111-112.

---

## Wildlife Habitat

**Goal 1: Big Game.** Maintain habitat for elk, deer, antelope, and bighorn sheep populations consistent with Idaho Department of Fish and Game (IDFG) management objectives stated in the IDFG *Strategic Plans for Big Game Management, 1991-1995*.

**Rationale:** IDFG management plans call for stabilizing big game numbers at 1991 levels. BLM policy requires wildlife forage and habitat allocations and consistency with State and local plans, to the extent feasible.

1. Provide forage and habitat for 1991 stable big game populations (see **Chapter 3 - Wildlife: Table 3-35: Estimated Big Game Numbers and Season of Use**, p. 316).
2. Coordinate with the IDFG during preparation and update of their five-year strategic plans for big game. As necessary, provide comments on population objectives. The IDFG would be encouraged to keep big game numbers at 1991 levels unless habitat data show that numbers need to be adjusted to avoid conflict with other resource uses.
3. Except where otherwise noted in the RMP (*e.g.*, Wildlife Habitat, Goal 1, #6, p. 95), where conflicts between livestock and big game populations for available forage and habitat are identified, resolve conflicts on a case-by-case basis in consultation with the IDFG and other interested publics.
4. Monitor key habitat sites to ensure that big game populations do not exceed proper levels or damage important habitat components. Design monitoring to determine whether big game are adversely affecting progress toward the riparian and aquatic habitat conditions described in *Attachment 15* (see p. 149).
5. The following areas would be priority areas for big game habitat monitoring (additional monitoring studies would be established as needed):

Donkey Hills	(elk, deer)
Birch Creek/Mud Springs Gulch	(bighorn sheep)
Morgan Creek	(bighorn sheep)
East Fork	(bighorn sheep)
Navarre Creek to Grant Creek	(elk, deer)
Willow Creek Summit	(elk)
Riparian Habitats	(moose, elk)

6. Plan, design, and manage land use activities, including grazing management actions and range improvement projects, located on the (a) Morgan Creek, Cronk's Canyon, East Fork Salmon River, and Birch Creek/Mud Springs Gulch bighorn sheep winter ranges (see *Map 17: Bighorn Sheep Winter Ranges*) or the (b) Willow Creek Summit or Donkey Hills elk winter ranges (see *Map 21: Elk Winter Ranges and Donkey Hills Calving Area*) to ensure the continued viability of bighorn sheep and elk populations dependent on these key habitat areas. Fully analyze any potential for adverse effects on the viability of bighorn sheep or elk populations in appropriate site-specific NEPA documentation.

*For additional RMP decisions relating to big game habitat management, also see ACECs - Birch Creek and Donkey Hills ACECs, pp. 30-33, and Forest Resources, Goal 1, #18 and 19, p. 52.*

**Goal 2: General.** Sustain diverse and abundant wildlife populations (game and nongame), consistent with IDFG management objectives and BLM policy directives, by improving wildlife habitat currently in unsatisfactory condition, and maintaining habitat currently in satisfactory condition.

**Rationale:** The BLM is responsible for management of wildlife habitat on the Resource Area's public lands. BLM policy requires management for self-sustaining populations and a natural abundance and diversity of wildlife.

1. Continue ongoing inventories and monitoring studies on key wildlife habitats and populations. Establish nongame bird studies in each major habitat type. (Also see Wildlife Habitat, Goal 1, #5 (p. 94) and Goal 3, #2 (p. 97)).
2. Continue to develop and maintain wildlife habitat improvement projects (*e.g.*, wildlife water developments, fence modification projects, exclosures, prescribed burns), except where projects would adversely affect salmon, steelhead trout, or bull trout habitats or other important resource values.
3. Continue to implement, and revise as appropriate, the Willow Creek Summit, East Fork Salmon River, and Chilly Slough Habitat Management Plans (HMPs) (see *Attachment 2: Procedures Used When Developing or Revising Activity Plans*, p. 103).
4. Continue routine coordination procedures with the Animal and Plant Health Inspection Service (APHIS) on matters concerning animal damage control (ADC). Annually review the ADC cooperative agreement to determine the need for modification.
5. Implement efforts to acquire tracts of high value wildlife habitat (*e.g.*, key big game winter ranges, high value wetland-riparian habitats) as opportunities arise.
6. Designate OHV use in the following areas as "limited" to protect wildlife values, with the limitations as follows: Prohibit motorized vehicle travel during the winter/spring period between December 16 and April 30, inclusive. Restrict motorized vehicle travel to existing roads, vehicle ways, and trails between May 1 and December 15, inclusive. (Also see OHV Use, Goal 1, #1, p. 69 and *Map 33: OHV Use*).
  - a) Carlson Hills (4,200 acres)
  - b) Willow Creek Summit elk winter range
  - c) Donkey Hills ACEC

- d) Birch Creek ACEC
  - e) Old Stage Road
  - f) Second Spring Basin
7. Desired Plant Communities (DPC) for meeting wildlife habitat objectives on rangeland sites would be those which produce maximum amounts of forage and natural cover (see Livestock Grazing, Goal 1, #10, p. 61).
8. In the following wildlife habitat areas, unless NEPA analysis and consultation with the IDFG determine that restrictions on a permitted activity are not necessary, BLM permitted activities (other than permitted livestock use, unless restricted elsewhere) would be (1) restricted to prevent disturbance during the specified crucial periods, and (2) designed to eliminate adverse effects (in consultation with the IDFG and other interested publics):

<u>Habitat Area</u>	<u>Restricted Period</u>
Big Game Winter Ranges	11/15-4/30
Elk Calving Areas	4/30-6/30
Active Raptor Nest Sites	
Golden Eagle	3/15-7/15
Boreal Owl	2/1-6/30
Long-eared Owl	3/15-6/30
Great-Grey Owl	3/1-7/15
Buteo Hawk	5/1-7/31
Cooper's Hawk	4/1-7/15
Goshawk	3/1-8/30
Sage Grouse Strutting Grounds	3/1-5/15
Sage Grouse Nesting/Brood-rearing Areas	4/15-6/30
Antelope Fawning Concentration Areas	5/1-6/30

9. Implement the Salmon BLM's Fish and Wildlife 2000 Plan (1993) as follows:
- (a) Improve habitat quality for big game and upland game within 15 years on approximately 90,000 acres by (1) developing new wildlife watering sources at appropriate locations, (2) modifying livestock fences as necessary to conform with BLM design standards, and (3) using prescribed fire or other types of vegetative treatment to increase forage quality and availability on big game ranges.
  - (b) Inventory commercial timber stands for raptor nest sites and update existing raptor cliff nesting site inventories within 15 years.
  - (c) Provide water for wildlife between June 1 and October 15 (at those key livestock water troughs where the need for wildlife water is identified) by implementing a coordinated program with the IDFG and affected livestock operators.
  - (d) Improve osprey habitat to support 5 breeding pairs by installing nesting platforms along the Salmon River corridor within 10 years.

- (e) To minimize disturbance of wildlife during crucial winter periods, seasonal occupancy stipulations (as described in *Attachment 10: Leasable Minerals Stipulations*, Stipulations #1 and 2, pp. 136-138) may apply to energy mineral leases and applications for permits to drill on approximately 550,000 acres of big game winter ranges.
  - (f) The following areas would be a priority for wildlife habitat activity planning: elk habitat in the Donkey Hills, bighorn sheep habitat in the East Fork Salmon River, Birch Creek, Morgan Creek, and Cronk's Canyon areas, and wetland habitat in Chilly Slough. See *Map 17: Bighorn Sheep Winter Ranges*, *Map 21: Elk Winter Ranges and Donkey Hills Calving Area*, and *Map 18: Chilly Slough Wetland Conservation Project Area*.
10. On a case-by-case basis, coordinate with appropriate Federally recognized tribes on wildlife habitat management actions that may affect tribal treaty rights. In addition, when developing management plans and improvement projects, give priority consideration to provide benefits to wildlife species traditionally used for subsistence and non-subsistence purposes by Native American groups under treaty.
  11. Withdraw forty-one (41) small forest stands totalling about 980 acres (primarily old growth) from the commercial timber base to maintain wildlife cover in open areas (see *Map C: Suitable Commercial Timberlands*). Also see Forest Resources, Goal 1, #23, p. 52 for forest management to maintain old growth forest values for wildlife.

*For additional RMP decisions which manage and protect habitat for wildlife, also see ACECs - "Management Decisions Common to All ACECs" and Birch Creek, Cronk's Canyon, Donkey Hills, Summit Creek, and Thousand Springs ACECs (see pp. 29-33 and 38-39) and Biological Diversity, Goal 1, #1-6, p. 40.*

**Goal 3: Riparian Wildlife Habitat.** Improve riparian and wetland areas to provide quality habitat for all riparian-dependent wildlife species.

**Rationale:** The BLM is responsible for managing wetland-riparian areas to protect, maintain, and enhance their unique characteristics. More species of wildlife (game, nongame, threatened, endangered, and sensitive species) depend on wetland-riparian habitat than on any other single habitat type.

1. Develop riparian pastures and riparian study exclosures throughout the Resource Area where an ID team identifies the opportunity.
2. Continue ongoing riparian inventories and monitoring studies and implement additional inventories and studies as needed.
3. Implement the riparian portion of the Salmon BLM's Fish and Wildlife 2000 Plan (1993) as follows:
  - (a) Improve 75 percent of riparian habitat (as defined in the *Glossary*, p. 180) to "proper functioning condition" (see *Attachment 1: Riparian-Wetland Area Function Classification*, pp. 101-102). This would be accomplished through a coordinated ID team process to implement the riparian objectives and management decisions described under Fisheries (pp. 45-47), Livestock Grazing (pp. 59-63), and Riparian Areas (pp.

79-82).

- (b) Continue to implement the Chilly Slough wetland conservation project, as described in *Attachment 11: Summary of the Chilly Slough Wetland Conservation Project*, p. 144). (Also see Land Tenure and Access, Goal 1, #6, p. 54.)
- (c) Construct nest boxes, nest platforms, nesting islands, and fences, as appropriate, to increase waterfowl production on Herd Lake, Summit Reservoir, Chilly Slough, and the Main Salmon River. Design and implement management strategies on these key wetland sites and other riparian sites to increase residual vegetation for waterfowl nesting cover and improve nongame wildlife habitat.

**Goal 4:** Re-establish bighorn sheep and other native wildlife species in unoccupied habitats, consistent with IDFG management plan goals.

**Rationale:** The IDFG bighorn sheep management plan calls for reintroduction of bighorn sheep into several areas. It is BLM policy that reintroduction of native wildlife species may be considered when sponsored by the State wildlife agency.

- 1. Reintroductions of native wildlife may be considered when proposed. Prior to reintroduction, resolve conflicts with other resource uses (if determined to exist) through an interdisciplinary team and NEPA process in consultation with the IDFG, appropriate Federally recognized tribes, and other interested parties. (Also see *Attachment 7: 1998 Revised Guidelines for Domestic Sheep and Goat Management in Native Wild Sheep Habitats*, pp. 117-119.)

---

## Wild and Scenic Rivers

**Goal 1:** Identify rivers which are suitable for inclusion in the National Wild and Scenic River System (see *Attachment 18: Wild and Scenic Rivers Study*, pp. 152-153) and prescribe appropriate management.

**Rationale:** Required by the Wild and Scenic Rivers Act (P.L. 90-542, as amended) and BLM policy.

- 1. (a) Public land uses within Wild and Scenic River (WSR) corridors of river segments which are found suitable or are eligible for further study, with a suitability finding deferred until a later coordinated study (see *Map H: Wild and Scenic River Suitability Findings* and #2-5 below), would be managed to maintain the level of development that resulted in the segments' tentative classifications, to ensure non-degradation of outstandingly remarkable (OR) values, and to protect free-flowing characteristics; other PRMP actions would also apply, if consistent with the provisions listed above.
- (b) River segments which are either found suitable or eligible for further coordinated study in this PRMP, but later released by Congress from WSR review, would be managed in accordance with other applicable sections of the PRMP.

2. The following river segments are eligible for further study, with suitability findings deferred until a coordinated river study with the State of Idaho and the USFS is completed. Pending completion of that study, manage these segments as stated in #1a above.

**East Fork Salmon River "A" (EF-01a)**

OR values: Scenic, Recreational, Fisheries  
Classification: Recreational

**East Fork Salmon River "B" (EF-01b)**

OR values: Scenic, Recreational, Fisheries  
Classification: Recreational

**Main Salmon River (MS-01)**

OR values: Recreational, Fisheries, Geological  
Classification: Recreational

**Cow Creek (MS-04)**

OR values: Fisheries  
Classification: Wild

**Thompson Creek (MS-33)**

OR values: Fisheries  
Classification: Recreational

**Squaw Creek (MS-37)**

OR values: - Fisheries  
Classification: Recreational

**Bayhorse Creek (MS-46)**

OR values: Fisheries  
Classification: Recreational

**Pahsimeroi River "A" (P-27)**

OR values: Scenic, Recreational, Fisheries, Cultural  
Classification: Scenic

**Mahogany Creek (P-29)**

OR values: Scenic, Recreational, Fisheries  
Classification: Scenic

3. The following river segment is eligible for further study, with a suitability finding deferred until a coordinated river study with the Upper Snake River District BLM is completed. Pending completion of that study, manage this segment as stated in #1a above.

**Summit Creek (LL-01)**

OR values: Recreational, Ecological  
Classification: Recreational

4. The following river segments are found suitable. Manage as specified below (in addition to the management outlined in #1a above).

**Big Lost River "A" (BL-17)**

OR values: Scenic, Recreational, Geological, Cultural, Ecological, Other  
Classification: Scenic

Suitable with a Scenic classification - only the 7.3 mile segment including the portion of Big Lost River "A" above T8N, R21E, Section 30 NENWSENW and the North Fork Big Lost River. Any plans developed for the affected area would include, as a priority, maintenance and enhancement of the outstandingly remarkable cottonwood gallery forest.

**Herd Creek (EF-12)**

OR values: Fisheries, Cultural  
Classification: Recreational

5. The following river segments are found suitable only as part of a system of river segments. Manage as stated in #1a above.

**East Fork Big Lost River (BL-15)**

OR values: Scenic, Recreational  
Classification: Recreational

Suitable with a Recreational classification, only as part of a system including the Big Lost River "A" - BL-17 (and the North Fork Big Lost River - see #4 above).

**Dry Creek (LL-03)**

OR values: Scenic, Recreational  
Classification: Recreational

Suitable with a Recreational classification, only as part of a system including USFS lands.

**West Fork Morgan Creek (MS-67)**

OR values: Fisheries, Cultural  
Classification: Recreational

Suitable with a Recreational classification, only as part of a system including USFS lands.

## Attachment 1: Riparian-Wetland Area Function Classification

**Note:** The primary source for this discussion of riparian-wetland area condition classes is the USDI-BLM Riparian Area Management Technical Report 1737-9 (1993): *Process for Assessing Proper Functioning Condition*.

RMP objectives for the improvement of riparian-wetland areas are based on functional condition classes. By BLM definition, functional condition classes for riparian and wetland areas include the following: *proper functioning*, *functional at-risk*, and *non-functional*. The functioning condition of a riparian-wetland area results from the interaction among the geology, soil, water, and vegetation in the area. Classification is determined by evaluating the condition of certain physical and biological attributes through an interdisciplinary team assessment process. These attributes are important indicators of overall system function. The capability and potential of the stream and the associated riparian area are key assessments in determining the functionality of a riparian area. All streams do not have the same capabilities or potential to achieve a certain functioning condition. Capability and potential are considered when placing a riparian area in one of the following three categories:

**Proper Functioning** - Riparian areas in this class are functioning properly when adequate vegetation, land form, or large woody debris are present to dissipate stream energy, attenuate high water flows, filter sediment, capture bedload material, develop and maintain floodplains, provide forage for grazing animals, improve water retention and water quality, recharge ground water, stabilize streambanks, reduce erosion, provide fish and wildlife habitat, and support biodiversity. Proper functioning riparian areas have several key physical and biological attributes:

- 1) Geomorphological attributes include one or more of the following:
  - a) Bank stability - Vegetation, rock, cobble or woody debris are adequate to protect the stream channel and streambank from the erosive forces of water.
  - b) Well-developed floodplains are adjacent to non-incised channels.
  - c) Incised channels have developed a floodplain stabilized by desirable riparian vegetation.
  - d) Channel geometry allows bankfull discharge which results in floodplain activation on a regular basis (*e.g.*, 2 to 3 year flow event).
- 2) Vegetation attributes
  - a) Herbaceous canopy is dominated by hydric herbaceous species with soil-binding root systems (such as sedge and rush species) which are exhibiting high vigor.
  - b) If woody species are present, the age class distribution includes replacement stock (seedlings and saplings).

3) Watershed attributes

- a) Watershed attributes reduce the potential for high flow events and maintain adequate levels of summer and winter base flows. A fully functional watershed would have plant communities exhibiting vegetative and litter cover necessary to reduce surface flows and provide for infiltration within the capability of the site.

**Functional At-risk** - Includes riparian or wetland systems that are functioning to dissipate stream energy without deterioration, but lack some of the important attributes of properly functioning systems. They are susceptible to degradation because of the sensitivity of the system to high runoff events, or because desirable attributes are lacking or may not be sustained in the long term. For example, functional at-risk systems may have the following physical and biological attributes:

- 1) Geomorphology - Channels with well developed floodplains, or incised channels with stable or developing floodplains that are at risk because of channel type, erodible soils, unacceptable bank stability, or downstream channel characteristics such as headcuts.
- 2) Vegetation - Bank stabilizing vegetation is not dominant. Woody riparian species age class distributions may be inadequate to maintain plant populations. Herbaceous plant communities may lack adequate amounts of deeply-rooted vegetation to stabilize banks, filter sediment, and develop and maintain floodplains.
- 3) Watershed - Degraded watershed condition or inadequate vegetative and litter cover increases the likelihood of damaging high flows from precipitation events or spring thawing.

**Non-functional** - Includes riparian or wetland systems that are not functioning as described above, or may be showing evidence of further deterioration because the required physical and biological attributes are inadequate.

- 1) Geomorphology - Incised channel with limited or no floodplain development.
- 2) Vegetation - Desirable vegetative species are not present in the required amounts, leaving banks unprotected.
- 3) Watershed - Degraded watershed condition, inadequate vegetative and litter cover, or existing rills and gullies increase the likelihood of damaging high flows from precipitation events or spring thawing.

## **Attachment 2: Procedures Used When Developing or Revising Activity Plans**

The following procedures would be used when developing or revising activity plans, such as Allotment Management Plans (AMPs), wild horse Herd Management Area Plans (HMAPs), wildlife Habitat Management Plans (HMPs), Integrated Resource Activity Plans (IRAPs) and other activity plans:

- \* Assemble an interdisciplinary team to participate throughout the process.
- \* Define the planning area boundary.
- \* Conduct a watershed assessment, or review and update, as necessary, existing watershed assessments.
- \* Identify resource values present throughout the area - not just those affected.
- \* Address data needs - existing data and data gaps.
- \* Identify opportunities, problems, and constraints within the planning area.
- \* Identify resource objectives.
- \* Identify strategies to meet resource objectives. Provide rationale and document how the strategies will meet the objectives.
- \* Identify schedule of implementation, necessary projects, support services needs.
- \* Develop effectiveness monitoring plan.
- \* Define methodologies for amending strategies.

### Attachment 3: Component Practices for Grazing Management in Lieu of BMPs

In order to achieve the goal of obtaining properly functioning riparian zones, a certain amount of standing vegetation stubble is required during the scheduled grazing period. This stubble should be at least 4 inches in height on riparian areas in proper functioning condition or functional-at-risk condition with upward trend, and at least 6 inches in height on riparian areas in functional-at-risk condition with downward trend or non-functional condition (see Riparian Areas, Goal 1, #5, p. 80).

The following guidelines are intended to provide an approximate relationship for use in comparing traditional utilization levels with expected grazing period four to six inch stubble height residuals. These seasonal utilization levels are approximate, dependent on annual climatic conditions and grass species, and most appropriate for riparian grasses similar in general growth form to *Poa pratensis*, *Agrostis stolonifera*, and *Deschampsia cespitosa*. Stubble height versus percent utilization relationships for these riparian grasses, as well as *Carex spp.* and *Juncus spp.*, are referenced in Kinney and Clary, 1994, *A Photographic Utilization Guide for Key Riparian Graminoids*, USFS Intermountain Research Station. The required four to six inch stubble height on these palatable riparian grasses is generally expected to be achieved through the following seasonal utilization standards and management practices from Clary and Webster (1989) recommended for pastures with good to high ecological status riparian areas:

1. On pastures grazed in the spring only, utilization of streamside herbaceous forage should be limited to about 65%, and livestock should be removed by July 10 to allow for regrowth. On lower elevation ranges the appropriate spring removal date may be substantially earlier.
2. Streamside utilization of herbaceous forage in summer-grazed pastures should not exceed 40 to 50%.
3. Fall use of streamside vegetation should not exceed about 30% with four to six inches of stubble remaining, as noted above.
4. Season-long grazing should be limited to situations such as riparian pastures, where animal use and distribution can be carefully controlled and stubble height requirements can be met.
5. Special situations, such as critical fisheries habitats or easily eroded streambanks, may require stubble heights greater than six inches.

The above recommendations are for riparian zones in good to high ecological status. In degraded riparian areas, complete rest from livestock grazing may be needed to initiate recovery. Once recovery to mid to late seral status has occurred, rotation management systems may allow riparian zones to remain in good condition, provided all livestock are removed after the grazing period.

Case-by-case grazing management practices compatible with those outlined by Clary and Webster (1989) would be applied and BMPs developed in accordance with the *Idaho Agricultural Pollution Abatement Plan* (Idaho Dept. of Health and Welfare *et al* 1993) for allotments which contain riparian habitat. Woody vegetation use requirements would also be developed as needed.

## **Attachment 4: Riparian Habitat Area Width Delineation in Streams or Other Waterbodies**

Riparian habitat delineations would be applied to four stream or water body categories (see below) where riparian-dependent resources receive primary emphasis and management activities are subject to specific standards or guidelines. The delineated areas include riparian corridors, wetlands, and other areas where proper ecological function is crucial to maintenance of the aquatic system. These riparian habitat delineations would apply until (a) a watershed assessment is completed by an ID team or (b) a site-specific analysis of each action is conducted and described by an ID team, and the rationale for any riparian area width delineation modification is completed.

**Category 1 (fish bearing streams):** Riparian habitat width for perennial fish-bearing streams or perennial portions of intermittent fish-bearing streams in forested systems consists of the stream and the area on either side of the stream extending from the edges of the active stream channel to the top of the inner gorge, or to the outer edges of the 100-year floodplain, or to the outer edges of riparian vegetation, or to a distance equal to the height of two site-potential trees, or 300 feet slope distance (600 feet, including both sides of the stream channel), whichever is greatest. **Riparian habitat width for perennial fish-bearing streams or perennial portions of intermittent fish-bearing streams in non-forested rangeland systems is the 100-year floodplain.**

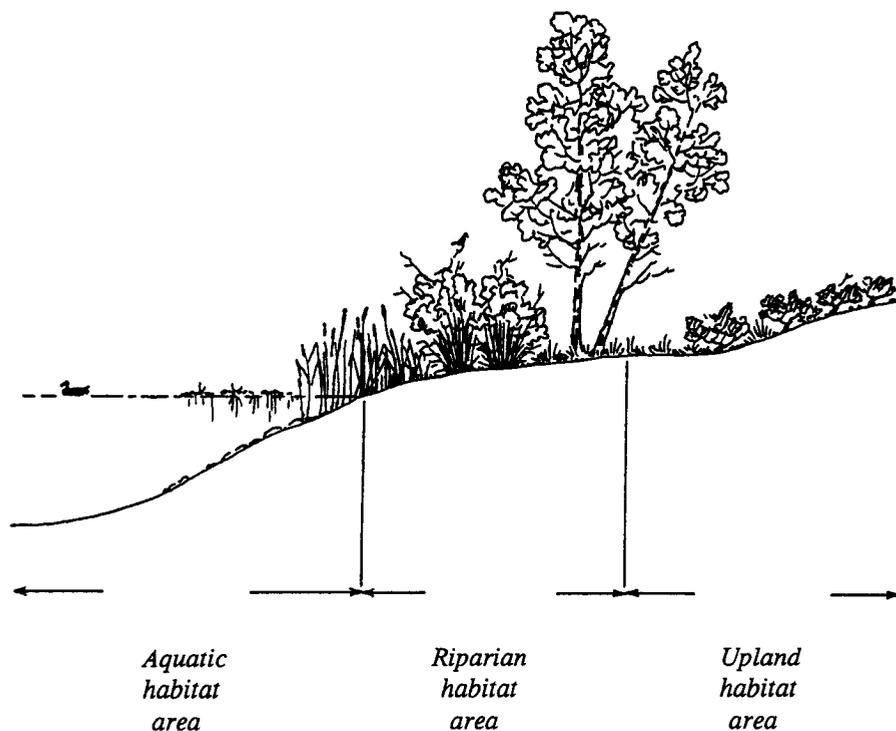

**Category 2 (non-fish bearing streams):** Riparian habitat width for perennial non-fish-bearing streams in forested systems consists of the stream and the area on either side of the stream extending from the edges of the active stream channel to the top of the inner gorge, or to the outer edges of the 100-year floodplain, or to the outer edges of riparian vegetation, or to a distance equal to the height of one site-potential tree, or 150 feet slope distance (300 feet, including both sides of the stream channel), whichever is greatest. **Riparian habitat width for perennial non-fish-bearing streams in non-forested rangeland systems is the 100-year floodplain.**

**Category 3 (ponds, lakes, reservoirs, and wetlands greater than 1 acre):** Consists of the entire body of water or wetland area, extending to the outer edges of the riparian vegetation, or to the extent of the seasonally saturated soil, or to the extent of moderately and highly unstable areas, or to a distance equal to the height of one site-potential tree, or 150 feet slope distance from the edge of the maximum pool elevation of constructed ponds and reservoirs, or from the edge of the wetland, pond or lake, whichever is greatest.

**Category 4 (wetlands less than 1 acre, landslides, and landslide prone areas):** This category includes features with high variability in size and site-specific characteristics. At a minimum the riparian widths must include:

- a. the extent of landslides and landslide-prone areas;
- b. for key watersheds, the area from the edges of the wetland, landslide, or landslide-prone area to a distance equal to the height of one site-potential tree, or 100 feet slope distance, whichever is greatest; and
- c. for watersheds not identified as key watersheds, the area from the edges of the wetland, landslide, or landslide-prone area to a distance equal to the height of one-half site-potential tree, or 50 feet slope distance, whichever is greatest.

**(Note:** Refer to the *Environmental Assessment for the Interim Strategies for Managing Anadromous Fish-producing Watersheds in Eastern Oregon and Washington, Idaho, and Portions of California* (USDA-Forest Service and USDI-BLM 1995) for a more detailed discussion of riparian habitat area delineations.)

*The width of the delineated riparian habitat area generally includes both the riparian habitat area itself and the aquatic habitat area adjacent to it. Portions of the adjacent upland habitat area may also be included, depending on the influence the uplands may exert on the riparian and aquatic habitats.*

## Attachment 5: Standard Operating Procedures

### General

1. A watershed assessment would be completed in the following situations: (a) prior to any activity which is determined by an ID team to have the potential for substantial watershed-level effects, (b) prior to development or revision of activity plans, or (c) as otherwise needed to enhance resource and program management within a specified watershed.
2. An interdisciplinary team (see *Glossary*, p. 174) will be used to plan and design activities and projects and help resolve conflicts between competing resource values.
3. A site-specific field assessment for threatened, endangered, and sensitive plant, animal and fish species will be completed as part of the assessment of the effects of all authorized actions. Assessments will be completed or reviewed by botanists, wildlife biologists, and fisheries biologists.
4. Projects will be planned and designed to reduce or eliminate impacts to special status species populations.
5. Case-by-case conferencing and consultation will be conducted with the U.S. Fish and Wildlife Service and (or) the National Marine Fisheries Service for actions that may affect threatened, endangered, and other special status plant, animal, or fish species, as required by the Endangered Species Act.
6. Burn plans which include incident and cumulative air quality considerations will be developed for all prescribed burn treatments.
7. All road construction will be in compliance with the road standards set forth in BLM Manual Section 9113.
8. All noxious weed treatment will be done in conformance with the Northwest Area Noxious Weed Control Program EIS, including preparation of a pesticide use proposal and a site-specific environmental assessment. All application of restricted-use pesticides will be done under supervision of a certified pesticide specialist.

### Cultural Resources

1. The BLM will make a reasonable and good faith effort to identify and evaluate historic properties as mandated by Federal historic preservation legislation. Intensive Class III cultural resource inventories as specified in BLM Manual Section 8111 will be conducted for all surface-disturbing project activities or the sale or transfer of lands from Federal ownership. Additional review and consultation with the State Historic Preservation Officer (SHPO) may identify other activities with the potential to affect cultural resources, thus requiring inventory.

The BLM will consult with the SHPO and the Advisory Council on Historic Preservation prior to implementing BLM actions, in accordance with regulatory guidance or by specific agreement. BLM actions will be designed to have no adverse effects on historic properties through the use of avoidance, data recovery, and project abandonment.

### **Hazardous Materials**

1. All hazardous materials incidents on public lands will be handled as outlined in the Idaho BLM Contingency Plan for Hazardous Materials Incidents (January 1997, or as updated) or other appropriate guidance.
2. All actions authorizing the use of hazardous materials will comply with Federal and State regulations.
3. BLM personnel will receive the following hazardous materials awareness training: (a) Education in accordance with the BLM Hazardous Waste Site Operation Hazwopper Health and Safety Program will be conducted annually. (b) All employees will receive a minimum 8 hour hazardous material awareness training annually. Employees that have field-oriented positions will receive a 24 hour training course. Hazardous materials coordinators will receive 40 hours of training, along with an annual 8 hour refresher training. (Hazardous materials coordinators typically receive extensive additional training.) (c) All pesticide applicators for the BLM will be certified by the state and BLM.
4. The following process will be followed upon encountering a suspected hazardous material incident:
  - (a) The initial response will be access control, notification of appropriate authorities, and limited securing and investigation of the suspected site.
  - (b) After identification of the site as potentially containing hazardous materials, access control, and preliminary investigation, implement the BLM's Cooperative Agreement with the State of Idaho Department of Environmental Quality (DEQ). This Cooperative Agreement provides for assistance to the BLM in sampling and identifying the hazardous material, investigating the site further, and approving contractor removal or remediation work plans.
  - (c) Upon determining the need to remove or remediate site contaminants, implement the Statewide Hazardous Waste Removal Contract (1992, or as updated). This contract provides for a contractor with ready-response capability to remove or remediate any hazardous material from the site.

## Land Tenure and Access

1. The BLM will cooperate with local (city and county) governments to identify public lands which might provide for orderly community expansion or for other public purposes. Public lands identified for these uses will be retained until the city or county either develops a planned use, or it is identified for a more important use by the BLM.
2. Lands will be acquired, sold, or exchanged in accordance with FLPMA and other applicable Federal laws and regulations to provide for more efficient management of the public lands and to accomplish management objectives developed in approved land use plans. Land use plans must be explicit as to which FLPMA Section 203 criterion is met for each tract identified for sale. However, disposal action is discretionary and is neither required nor mandatory.
3. Public lands will be managed for the protection and enhancement of known habitat for State and Federal sensitive, threatened, or endangered plant and animal species.
4. All public lands proposed for disposal will be inventoried in accordance with the current memorandum of understanding between the BLM, the State Historic Preservation Officer, and the Advisory Council on Historic Preservation. Lands with sites eligible for the National Register of Historic Places will not be disposed of without a finding of no adverse effects (36 CFR 800.9 (c)).
5. Private inholdings which are acquired within Wilderness Study Areas (WSAs) will be managed consistent with the BLM's Interim Management Policy for Lands Under Wilderness Review until Congress designates them or decides they are unsuitable. Disposal of public lands within WSAs is prohibited. If Congress decides they are unsuitable, they will be managed in accordance with this RMP.
6. Consistency will be maintained with county zoning regulations, other State and Federal agency land use plans, and treaties covering ceded lands pursuant to Department of the Interior regulations and BLM policy, "so long as the guidance and resource management plans are also consistent with the purposes, policies and programs of Federal laws and regulations applicable to public land..." (43 CFR 1610.3-2).
7. Areas of known geological structures or areas containing high potential for mineral development will normally be retained in public ownership. Exchange of subsurface estates, when it is in the government's interest, is encouraged.
8. Available BLM resources should first be directed to the management and enhancement of identified Management Areas (see *Glossary*, p. 176). Lesser priority should be given to the management and enhancement of identified Adjustment Areas (see *Glossary*, p. 166 and *Map A: Adjustment/Management Areas*). (See Land Tenure and Access, Goals 1 and 2, pp. 53-56 for descriptions of areas proposed as Management Areas and Adjustment Areas.)

9. All land use authorizations (e.g., permits, leases, rights-of-way) will contain standard stipulations as applicable.

### **Minerals**

1. Oil and gas leasing and development will be managed under regulations found in 43 CFR 3100.
2. Geothermal leasing and development will be managed under regulations found in 43 CFR 3200.
3. Non-energy minerals will be managed under regulations found in 43 CFR 3500.
4. Mineral material disposals will be managed under regulations found in 43 CFR 3600.
5. Locatable minerals will be managed under regulations found in 43 CFR 3800.
6. A plan of operations will be required when an operation will disturb more than five acres in any calendar year, or for any level of activity exceeding casual use in the following special category lands:
  - (a) Areas designated for potential addition to or which are an actual component of the Wild and Scenic Rivers System.
  - (b) Designated Areas of Critical Environmental Concern.
  - (c) Areas designated as part of the National Wilderness Preservation System and administered by the BLM.
  - (d) Areas designated as "closed" to off-road vehicle use.

### **Noxious Weeds**

The following standard operating procedures from the *Final Environmental Impact Statement, Vegetation Treatment on BLM Lands in Thirteen Western States* (BLM 1991) will be followed:

1. Use only the 21 herbicides approved for use. Two specific herbicides, Amitrole and Dalapon, are rejected for use on public lands.
2. All seed purchased for reseeding will be tested for purity and noxious weeds.
3. BLM Manual 9014 will be followed when using biological controls.

4. As part of site-specific analysis and preliminary planning of weed management and vegetation treatment, a field survey will be completed which includes assessment of riparian values, special status species, wildlife use, cultural resources, associated plant species, and other values that may be affected by treatment.
5. A NEPA analysis will be conducted for treatment proposals.
6. Projects which may affect cultural resources will be subject to standard cultural surveys and site clearances.
7. Herbicide treatment in recreation areas will occur before or after maximum use periods. Treatment sites will be posted.
8. Projects that may affect threatened or endangered species will be subject to Section 7 consultation with the USFWS and (or) NMFS.
9. If herbicides are used, those with minimum toxicity to fish and wildlife will be selected. Protective buffer areas will be provided along riparian and dry water courses.

#### **Paleontological Resources**

1. A professional paleontologist will be consulted upon identification of paleontological resources within the area of affect of a BLM-permitted or initiated action.

#### **Wilderness Study Areas**

1. Until released by Congress, Wilderness Study Areas (WSAs) will continue to be managed in accordance with the BLM's Interim Management Policy and Guidelines for Lands Under Wilderness Review (H-8550-1; 7/5/95).
2. WSAs designated as wilderness will be withdrawn from all forms of mineral entry and the general land laws.

#### **Wild Horses and Burros**

1. Gathering will take place in the fall, after major foaling has occurred and when air temperatures are lower, reducing stress on the animals.
2. Pasture and allotment boundary fences between the capture site and animals to be captured will be rolled out of the way or completely removed prior to moving horses through the area.

3. If helicopters are used in the capture process, only experienced pilots authorized by the Office of Aircraft Services will be utilized.
4. A qualified veterinarian will be on-site at all times during the capture and animal processing process.
5. Removal of excess animals will be in accordance with Federal regulations regarding the Wild Horse and Burro Act of 1971 and State of Idaho estray and humane animal treatment laws.
6. Humane disposal of sick, lame, or old animals will be accomplished by shooting by authorized BLM employees or drugging by a qualified veterinarian using only injectable barbiturates.
7. The BLM will cooperate with the State of Idaho during gatherings. A State brand inspector will be contacted prior to gatherings, and all branded horses gathered will be turned over to the brand inspector in accordance with State estray laws.
8. If it becomes necessary to hold animals in the capture facility for any period of time, such as overnight, adequate water and feed will be made available.

### **Wildlife**

1. Perceived conflicts between big game and livestock for forage and habitat will be studied according to the Policy Statement and Memorandum of Understanding (MOU) between the IDFG, BLM and USFS (see *Attachment 6*, pp. 113-116), as long as the MOU remains in effect.
2. BLM guidelines for domestic sheep and goat management in native wild sheep habitats (see *Attachment 7*, pp. 117-119) will be implemented as part of the RMP.
3. Wildlife escape devices will be installed and maintained in all water troughs.

### **Wild and Scenic Rivers**

1. Management activities on public lands adjacent to a designated Wild and Scenic River will be managed to protect the outstandingly remarkable values for which the Wild and Scenic River was designated.

## **Attachment 6: IDFG/USFS/BLM Elk Policy Statement and Memorandum of Understanding**

### **Policy Statement**

This policy statement addresses the complex issue of perceived conflicts between wild ungulate and domestic livestock use of public rangelands. Riparian areas in particular have been the focus of the controversy, but the issue is not restricted to those areas. Misinformation, livestock use, recent drought conditions, and increasing wild ungulate numbers, particularly elk, are generally responsible for these perceptions. The various agencies are committed, by law, to the enhancement, protection, and proper management of public rangeland resources.

Little or no scientifically collected data exist to support claims that wild ungulates have had or are having a detrimental impact on areas of concern. In the past, efforts to determine the extent of the conflict, or even to determine if a conflict exists, have been fragmented, incomplete, or unsuccessful. These efforts indicate the need for a unified approach to study the problem on areas of concern.

Through a Memorandum of Understanding, the agencies will implement an interdisciplinary approach to define problems on a case-by-case basis and, if necessary, to determine actual use by both wild and domestic ungulates through a monitoring program. Before monitoring results are presented publicly or used to determine specific courses of management action, interagency concurrence shall be required on (1) the adequacy of data collected through the monitoring program, and (2) the conclusions arrived at from the analysis of monitoring data.

Public demand currently exists to maintain or increase all wild ungulate populations for both consumptive and nonconsumptive recreational uses. We will stress to concerned parties and the public that our first priority is to properly manage the vegetative resource. Multiple-use management of public lands must reflect changing demands for recreation, wildlife habitat, livestock grazing, and various other uses.

It shall be the policy of the undersigned agencies to:

1. Recognize and stress that proper management of the vegetative resource takes priority over competing demands for that resource.
2. Define or evaluate perceived conflicts on a case-by-case basis.
3. Utilize interdisciplinary teams to establish procedures for collection of monitoring data relevant to rangeland conflicts.
4. Utilize interdisciplinary/interagency teams to analyze and evaluate monitoring data.
5. Define the problem and resolve it through proper management practices.

6. Publicly present the results, recommendations, or decisions based on the monitoring data only upon the mutual concurrence of all of the undersigned agencies.

Signed by the following agency representatives:

Jerry Conley, Director, Idaho Department of Fish and Game (September 3, 1991)

Gray F. Reynolds, Regional Forester, USDA, Forest Service - Region 4 (October 9, 1991)

Pieter J. Van Zanden, Associate State Director, USDI, Bureau of Land Management - Idaho (October 26, 1991)

\* \* \* \* \*

### **Memorandum of Understanding**

Idaho Department of Fish and Game, Region 7  
USDA Forest Service, Challis and Salmon National Forests  
USDI Bureau of Land Management, Salmon District

This Memorandum of Understanding is entered into by and between the Idaho Department of Fish and Game, Region 7, hereinafter referred to as the Department, the Forest Service, USDA, Salmon and Challis National Forests, hereinafter referred to as the Forest Service, and the Bureau of Land Management, USDI, Salmon District, hereinafter referred to as the Bureau.

WHEREAS, The Department has been created under the laws of the State of Idaho to provide for the protection, preservation, and management of wildlife and fish populations within the State, and

WHEREAS, The Forest Service is authorized by acts of Congress and by regulations issued by the Secretary of Agriculture to manage fish and wildlife habitat on the National Forest system lands, and

WHEREAS, The Bureau is authorized by acts of Congress and by regulations issued by the Secretary of the Interior to manage fish and wildlife habitat on the public lands, and

WHEREAS, it is the mutual desire of the Department, the Forest Service, and the Bureau to work together for the common purpose of developing, maintaining, and managing all resources on lands administered by the National Forests and the Bureau for the best interests of the people of Idaho and of the United States.

NOW THEREFORE, in consideration of the above premises, it is mutually agreed and understood by the Bureau, the Department, and the Forest Service that:

Monitoring efforts for rangeland conflicts will be sufficient to determine utilization levels by both wildlife and livestock, and done consistently and uniformly between agencies.

Monitoring studies relevant to rangeland conflicts will be designed to identify the primary source of impacts and obtain necessary data in a systematic and defensible manner.

The aforementioned studies will be mutually done at one of three levels of intensity, determined by primary objectives, the resource values of the area in question, the degree and kind of conflict perceived to be occurring, and the amount of controversy surrounding the subject area.

The first level of monitoring intensity used to detect conflicts between wild ungulates and livestock shall involve one of the following two methods: (1) The utilization pattern mapping method may be used, before and after livestock grazing has occurred, if an entire area or watershed has been identified as the area of concern. (2) The utilization transect method may be used if the area of concern is site-specific and can be adequately sampled by a transect. Riparian zones or vegetative manipulation projects are examples of site-specific areas where utilization transects are applicable.

The height-weight method to determine percent utilization shall be used on utilization transects. Utilization cages and/or a utilization gauge (Aldon, E.F. and R.E. Francis. 1984. A modified utilization gauge for western range grasses. USDA Forest & Range Res. Sta. Res. note RM-438) will be used to establish height-weight relationships for key forage species.

The second level of monitoring intensity will require use of the paired-plot utilization method. Paired plot utilization cages are placed and clipped: (1) before the livestock use an area; (2) after the livestock use an area; and (3) at the end of the growing season. This method can be used in combination with utilization pattern mapping.

The third and more intensive level of monitoring will require both the use of exclosures and the paired plot utilization method. An area fenced to exclude both wild and domestic ungulates would be constructed within a larger livestock exclosure. Wild ungulates would not be prevented from using the livestock exclosure, but would be unable to use the innermost exclosure. Use within these exclosures could then be compared to each other and to areas outside the exclosures that are used by both wild and domestic ungulates.

Whenever possible and funding is available the utility establishing exclosures constructed as described above can be useful even when not used in conjunction with any level of monitoring. An ocular reconnaissance of the exclosed areas can often reveal even to the casual observer whether or not a conflict exists.

Permanent photo plots shall also be established at monitoring sites. Depending on the level of significance determined via level one, either the second or third level of monitoring will be done.

The significance of ungulate use under the first, second, or third level of monitoring will be determined by the interagency team.

Conclusions derived from monitoring data will have the concurrence of all agencies before being presented publicly. Problems identified in this manner would then be resolved through a change in resource management practices.

Interdisciplinary teams will be formed to collect, analyze and evaluate data on each area of concern. The teams will include a wildlife biologist, land manager, and range conservationist, at a minimum. Additional specialists or private individuals may be included on this team as deemed appropriate by the land manager.

An interdisciplinary/interagency core team will also be created to establish monitoring procedures as needed, and to review the work of site-specific teams in order to ensure that policies and monitoring procedures are being followed uniformly. The core team shall, at a minimum, consist of one wildlife biologist, one range conservationist, and one land manager with decision-making ability. The core team shall also include at least one representative from each agency.

Signed by the following agency representatives:

Gary Power, Regional Supervisor, Idaho Department of Fish and Game (September 9, 1991)

Ronald Johnson, [for] Forest Supervisor, USDA Forest Service, Challis National Forest (September 13, 1991)

John Burns, Forest Supervisor, USDA Forest Service, Salmon National Forest (September 16, 1991)

Roy Jackson, District Manager, Bureau of Land Management, Salmon District (September 12, 1991)

## **Attachment 7: 1998 Revised Guidelines for Domestic Sheep and Goat Management in Native Wild Sheep Habitats**

**Note:** These guidelines for domestic sheep and goat management in native wild sheep habitats were included as Attachment 1 to BLM Instruction Memorandum No. 98-140 (July 10, 1998). The 1998 revised guidelines were developed following a review of the 1992 Guidelines for Domestic Sheep Management in Bighorn Sheep Habitats (Instruction Memorandum 92-264) in June 1997, and a follow-up meeting of bighorn and domestic sheep specialists in April 1998. Instruction Memorandum 98-140 states that these revised guidelines "should be followed whenever reintroductions, transplants, or augmentations of wild sheep populations, or proposed changes in a livestock grazing permit on BLM administered lands are being considered...."

\* \* \* \* \*

The Bureau of Land Management desires progressive native wild sheep management compatible with appropriate grazing on public lands by domestic sheep and free-ranging goats.

It is recognized by State and Federal agencies, native wild sheep organizations, and the domestic sheep industry that:

- There are some disease agents that occur in both domestic sheep and goats and native wild sheep. There is evidence that if native wild and domestic sheep are allowed to be in close contact, health problems and die offs may occur. Some disease agents may be transmitted between both species. There is evidence indicating that some disease agents could be transmitted between domestic goats and native wild sheep;
- There are native wild sheep die-offs that occur with no apparent relationship to contact with domestic sheep or goats;
- The above observations are both valid and not mutually exclusive;
- Bacterial pneumonias are not the only diseases of concern, although perhaps they are the most catastrophic;
- The risks of disease transmission are often unknown; they may, however, be site-specific; and
- Reasonable efforts must be made by domestic sheep and goat permittees and wildlife and land management agencies to minimize the risk of disease transmission, and to optimize preventive medical and management procedures, to ensure healthy populations of native wild sheep and domestic sheep and goats.

In recognition of the above factors, the guidelines set forth below should be followed in current and future native wild/domestic sheep and goat use areas unless a specific cooperative agreement that includes the State wildlife management agency, the BLM and the livestock permit holder is in place. When such agreement is in place, the agencies and the livestock permit holder will be held harmless in the event of disease impacting either native wild sheep or domestic sheep and

goats.

1. State wildlife and Federal land management agencies, native wild sheep interest groups, and domestic sheep and goat industry cooperation and consultation are necessary to maintain and/or expand native wild sheep numbers. When agency and industry agreement has been reached to maintain and/or expand native wild sheep numbers, the agencies and the domestic sheep industry will be held harmless in the event of disease impacting either native wild sheep or domestic sheep and goats.
2. Domestic sheep or goat grazing and trailing should be discouraged in the vicinity of native wild sheep ranges.
3. Native wild sheep and domestic sheep or goats should be spatially separated to reduce the potential of interspecies contact.
4. In reviewing new domestic sheep or goat grazing permit applications or proposed conversions of cattle permits to sheep or goat permits in areas with established native wild sheep populations, buffer strips surrounding native wild sheep habitat should be developed, except where topographic features or other barriers minimize physical contact between native wild sheep and domestic sheep and goats. Buffer strips could range up to 13.5 kilometers (9 miles) or as developed through a cooperative agreement to minimize contact between native wild sheep and domestic sheep and goats, depending upon local conditions and management options.
5. Domestic sheep and goats should be closely managed and carefully herded where necessary to prevent them from straying into native wild sheep areas.
6. Trailing of domestic sheep or goats near or through occupied native wild sheep ranges may be permitted when safeguards can be implemented to adequately prevent physical contact between native wild sheep and domestic sheep or goats. BLM must conduct on-site use compliance during trailing to ensure safeguards are observed.
7. Cooperative efforts should be undertaken to quickly notify the permittee and appropriate agency to remove any stray domestic sheep or goats or wild sheep in areas that would allow contact between domestic sheep or goats and native wild sheep.
8. Unless a cooperative agreement has been reached to the contrary, native wild sheep should only be reintroduced into areas where domestic sheep or goat grazing is not permitted.
9. Extraordinary precautions will be followed to protect special status subspecies, e.g., federally listed threatened, endangered, proposed and candidate subspecies, State listed subspecies and BLM sensitive subspecies.
10. For desert bighorn sheep, (*Ovis canadensis nelsoni*, *O.c. mexicana*, and *O.c. cremnobates*), the following additional guidelines are recommended:

- a. No domestic sheep or goat grazing should be allowed within buffer strips less than 13.5 kilometers (9 miles) surrounding desert bighorn habitat, except where topographic features or other barriers prevent physical contact.
  - b. Domestic sheep or goats trailed and grazed outside the 13.5 kilometers (9 mile) buffer and in the vicinity of desert bighorn ranges should be closely managed and carefully herded.
  - c. Unless a cooperative agreement has been reached to the contrary, domestic sheep or goats should be trucked rather than trailed, when trailing would bring domestic sheep or goats closer than 13.5 kilometers (9 miles) to occupied desert bighorn sheep ranges, especially when domestic ewes or nannies are in estrus.
11. These guidelines will be reviewed at least every 5 years by a work group comprised of representatives from the domestic sheep and goat industry, State wildlife agencies, BLM and native wild sheep organizations.

Photo by Anna Owsiak, Salmon, Idaho

## Attachment 8: Design Specifications

### General (Apply to All Resources and Programs)

1. BLM roads would be constructed and maintained to meet or exceed State approved BMPs for road construction and maintenance. Any road construction or maintenance would ensure progress toward desired riparian and aquatic habitat conditions (see *Attachment 15, p. 149*) and would include the following specifications for each existing or planned road:
  - (a) Roads and landings would be minimized in salmon, steelhead trout, and bull trout watershed riparian habitats.
  - (b) Watershed assessment would be completed prior to construction of new roads or landings in salmon, steelhead trout, or bull trout watershed riparian habitats.
  - (c) Road management objectives would be established for each road, including (1) preparation of road design criteria, elements, and standards that govern construction and reconstruction, and (2) operation and maintenance criteria that govern road operation, maintenance, and management.
  - (d) Road surface sloping and drainage patterns would minimize sediment delivery from the road surface to streams.
  - (e) Road management would minimize disruption of hydrologic flow paths.
  - (f) Sidecasting would be restricted.
  - (g) Road and drainage features that pose a substantial risk in a priority reconstruction would be reconstructed based on real or anticipated impacts to high ecological value riparian resources.
  - (h) Roads not needed for future management would be closed and stabilized, or obliterated and stabilized.
  - (i) New and existing culverts, bridges, and other stream crossings determined to pose a substantial risk to riparian and aquatic habitat conditions would be designed or improved to accommodate a 100 year flood, including associated bedload and debris.
  - (j) Fish passage would be provided for and maintained at all road crossings of existing and potential fish-bearing streams.
2. All ground disturbing activities undertaken by the BLM would include the following:
  - (a) Heavy equipment would be cleaned on-site after working in an area infested with noxious

weeds or cheatgrass.

- (b) Ground disturbance would be minimized.
  - (c) If determined by an ID team to be necessary for resource protection, disturbed areas would be seeded during the spring or fall immediately after construction (within 8 months).
  - (d) The area would be monitored for two years after disturbance to identify any infestations of noxious weeds. These would be treated within 12 months.
3. Seedings would include a variety of forb and grass species, and shrub species if appropriate, to meet project objectives. Native species would be emphasized and included in all seed mixes. However, at the recommendation of an ID team, non-native species may be included to enhance the establishment of native species, when rapid watershed protection is required, or when native species are unavailable in sufficient quantities.
  4. Only native material (*e.g.*, native seed and willow shoots) would be used to revegetate riparian areas.
  5. Ground disturbing treatments for noxious weeds would be seeded as soon as possible (within 8 months) with a competitive native seed mix. At the recommendation of an ID team, non-native species may be included (except in riparian areas) if site characteristics are unfavorable to expect reasonable success from native species, to enhance the establishment of native species, or when immediate watershed protection is required.

### **Forest Management: Timber Harvesting and Silvicultural Treatments**

1. Tractor skidding would be restricted to slopes of 45 percent or less in the volcanic, granitic, and sedimentary land types. Skidding on quartzite soils would be allowed on slopes up to 55 percent. One exception to the 45 percent restriction would be on small areas of convex slopes adjacent to roads within 20 feet of the subgrade. Some limited skidding activity on slopes up to 60 percent would be allowed in these areas.
2. All slash treatments would require piling or lop and scatter to a depth of less than 18 inches. All burning of slash would be conducted by BLM personnel in conformance with State air quality guidelines. No slash piling or burning would be allowed within riparian or aquatic habitats.
3. All skid trails with exposed soils subject to erosion would be crossdrained with the construction of water bars upon completion of skidding operations.
4. At least three nonhazardous snags per acre would be left in shelterwood harvest units for nongame wildlife use. In the absence of sufficient numbers of nonhazardous snags, some large culls would be substituted.

### **Forest Management: Road Construction and Rehabilitation**

1. Culverts, dips, and other water diversion structures would be designed to minimize stream sedimentation and maximize fish passage (see "General" design specification #1, p. 120).
2. No road construction would be allowed when the soil surface layer is saturated. Areas within salmon, steelhead trout, and bull trout watersheds which display unstable soils would be avoided in road construction.
3. All newly constructed haul roads and trails would be closed within 2 years following logging operations, with closure structures being permanent, designed to eliminate vehicular traffic through the area, and designed to channel overland water flow off of roads and skid trails.
4. Where slash is windrowed along newly constructed roads, breaks would be established at a minimum of 200 feet along windrows to facilitate wildlife passage.

### **Minerals**

1. Mine structures, support facilities, and roads would be located outside riparian areas in salmon, steelhead trout, and bull trout watersheds, unless no reasonable alternative exists. If no alternative exists, impacts to riparian and aquatic habitats would be reduced to the extent feasible. All surface disturbance would be reclaimed. Solid and sanitary mining waste facilities in riparian areas in salmon, steelhead trout, and bull trout watersheds would be prohibited. If no practical alternatives exist, other types of mineral development facilities may be located in riparian areas in salmon, steelhead trout, and bull trout watersheds with the following constraints: (a) analyze waste material using the best conventional sampling methods and analytic techniques to determine its chemical and physical stability; (b) locate and design facilities to ensure mass stability and prevent release of toxic materials; (c) monitor facilities to confirm predictions of chemical and physical stability, and make adjustments to operations as needed; (d) reclaim waste facilities to assure chemical and physical stability; and (e) require reclamation bonds adequate to ensure long term chemical and physical stability of mine waste facilities.

### **Rangeland Improvement**

1. Roads or trails to new rangeland improvement projects would not be constructed. Existing roads and trails would be used whenever possible.
2. All vegetative manipulation projects would be allowed a one-year review period by the IDFG prior to on-the-ground work. Vegetative manipulations would be done in an irregular pattern creating more edge effect, with islands of vegetation left for wildlife cover. The following design standards would apply to vegetation treatments on antelope or sage grouse winter ranges and sage grouse strutting grounds:

- (a) Treated areas would be laid out in strips no more than 100 feet wide. Untreated areas between strips would be a minimum of 100 feet wide.
  - (b) Spraying with herbicide would be done by helicopter or with ground equipment to provide precise control of the area sprayed. To control drift, spray would only be applied when wind velocity is less than 6 miles per hour.
  - (c) Spray projects would be designed to avoid loss of native forbs or any riparian vegetation along perennial and intermittent streams by establishing a buffer strip equal to the 100 year floodplain or 330 feet on both sides of the stream, whichever is greater.
3. Fence construction in identified wildlife use areas would conform to guidelines set forth in BLM Manual Section 1741. Fences constructed in wild horse areas would have enough contrast to make them visible to wild horses. Let-down fences would be considered in areas of wildlife migration. Proposed fence lines would not be bladed or scraped. Barbed-wire fences would normally consist of only three wires. Fences may consist of four wires (at BLM Manual Section 1741 standard heights) where it is demonstrated that three wire fence provides insufficient control to meet management objectives. Fences adjacent to riparian areas or small study sites may be as restrictive as necessary to protect resource values.
  4. Riparian and wetland areas around reservoirs and spring developments normally would be fenced to prevent livestock impacts. Troughs would be located outside of the riparian zone. Existing springs would be fenced when reconstructed. All new spring developments would require shut-off floats. Seeps and springs would not be developed into waterholes.
  5. Providing off-site water (such as a pipeline and trough system) would be the preferred method of providing water to livestock. Water gaps may be used if they do not hinder attainment of desired riparian and aquatic habitat conditions (see *Attachment 15*, p. 149).
  6. Utilization pattern mapping would be used to locate potential sites for range improvements.
  7. Within a given watershed, restrict vegetation conversion by mechanical and/or prescribed fire treatment within one mile of perennial streams to less than 20 percent of the area in any one year.
  8. Spring and seep developments would be designed to maintain existing riparian vegetation (*i.e.*, adequate water would be left naturally flowing to support existing riparian vegetation).

### Attachment 9: Fire Suppression and Rehabilitation Specifications

Follow *Minimum Impact Suppression Tactics Guidelines* (USDA Forest Service - Northern Region, 1993, or as revised) (see pages 99-107), or similar fire suppression and rehabilitation guidance. **Note:** Although *Minimum Impact Suppression Tactics Guidelines* is designed for "suppression action on wildfires located in wilderness, proposed wilderness or other lands with similar land management objectives," these "light on the land" guidelines would be applied to wildfires on all Challis Resource Area public lands, even lands without wilderness character or land management objectives.

Also incorporate the following actions.

1. Design fuel treatment and fire suppression strategies, practices, and actions so as not to hinder attainment of riparian management objectives, and to minimize disturbance of riparian ground cover and vegetation. Strategies should recognize the role of fire in ecosystem function and identify those instances where fire suppression or fuel management actions could perpetuate or be damaging to long-term ecosystem function; salmon, steelhead trout, or bull trout populations; or designated critical habitat.
2. Locate incident bases, camps, helibases, staging areas, helispots, and other centers for incident activities outside of riparian areas (as identified in *Attachment 4*, pp. 105-106). If the only suitable location for such activities is within these areas, an exemption may be granted following a review and recommendation by a resource advisor. The advisor will prescribe the location, use conditions, and rehabilitation requirements, with avoidance of adverse effects to salmon, steelhead trout, and bull trout a primary goal. Use an interdisciplinary team, including a fishery biologist, to predetermine incident base and helibase locations during presuppression planning, with avoidance of potential adverse effects to salmon, steelhead trout, and bull trout as a primary goal.
3. Avoid delivery of chemical retardant, foam, or additives to surface waters. An exception may be warranted in situations where overriding immediate safety imperatives exist, or, following a review and recommendation by a resource advisor and a fishery biologist, when the action agency determines an escaped fire would cause more long-term damage to salmon, steelhead trout, or bull trout habitats than chemical delivery to surface waters.
4. Design prescribed burn projects and prescriptions to contribute to the attainment of riparian management objectives.
5. Immediately establish an emergency team to develop a rehabilitation treatment plan to attain riparian management objectives and avoid adverse effects on salmon, steelhead trout, and bull trout whenever riparian areas within salmon, steelhead trout, or bull trout watersheds are significantly damaged by (a) a wildfire or a prescribed fire burning out of prescription or (b) fire suppression activities (see *Attachment 4*, pp. 105-106).

6. Trees may be felled in riparian areas within salmon, steelhead trout, or bull trout watersheds when they pose a safety risk (see *Attachment 4*, pp. 105-106). Keep felled trees on site when needed to meet woody debris objectives.
7. Apply herbicides, pesticides, other toxicants, and other chemicals in a manner that does not hinder attainment of riparian management objectives and avoids adverse effects on salmon, steelhead trout, or bull trout.
8. Prohibit storage of fuels and other toxicants within riparian areas in salmon, steelhead trout, and bull trout watersheds (see *Attachment 4*, pp. 105-106). Prohibit refueling within riparian areas in salmon, steelhead trout, or bull trout watersheds, unless there are no other alternatives. Refueling sites within these areas must be approved by the resource advisor and have an approved spill containment plan.
9. Locate water drafting sites to avoid adverse effects to salmon, steelhead trout, bull trout, and instream flows, and in a manner that does not hinder attainment of riparian management objectives.

*Indianola Fire Station - Along the Main Salmon River*

## Minimum Impact Suppression Tactics Guidelines

USDA Forest Service - Northern Region  
1993

**Note:** The following pages are quoted directly from, and provide the majority of the content contained in, *Minimum Impact Suppression Tactics Guidelines* (USDA Forest Service - Northern Region 1993). Beginning and ending quotation marks are omitted, since the entire document is quoted; however, where only portions of the document are reproduced, deletions are indicated by an ellipsis (...). Some errors in the original document (word choice, grammar, punctuation, etc.) have been edited.

**Preamble:** ...The following Minimum Impact Suppression Tactics (MIST) guide is designed to assist Forest Service fire personnel when taking suppression action on wildfires located in wilderness, proposed wilderness or other lands with similar land management objectives. The guidelines are intended to reduce fire suppression impacts on the land while insuring the actions taken are timely and effective....

**Concept:** The concept of Minimum Impact Suppression Tactics (MIST) is to use the minimum amount of forces necessary to effectively achieve fire management protection objectives, consistent with land and resource management objectives. It implies a greater sensitivity to the impacts of suppression tactics and their long term effects when determining how to implement an appropriate suppression response.... MIST is not intended to represent a separate or distinct classification of firefighting tactics, but rather a mindset of how to suppress a wildfire while minimizing the long term effects of the suppression action.... The principle of fighting fire aggressively, but providing for safety first, will not be compromised. The key challenge to the line officer, fire manager, and firefighter is to be able to select the wildfire suppression tactics that are appropriate, given the fire's probable or potential behavior. The guiding principle is always "least cost plus loss" while meeting land and resource management objectives... These actions, or MIST, may result in an increase in the amount of time spent watching, rather than disturbing, a dying fire to insure it does not rise again. They may also involve additional rehabilitation measures on the site that were not previously carried out. When selecting an appropriate suppression response, firefighter safety must remain the highest concern. In addition, fire managers must be assured the planned actions will be effective and will remain effective over the expected duration of the fire....

**Goal:** The goal of MIST is to halt or delay fire spread in order to maintain the fire within predetermined parameters while producing the least possible impact on the resource being protected. These parameters are represented by the initial attack incident commander's "size-up of the situation," in the case of a new start, or by the "escaped fire situation analysis (EFSA)," in the case of an escaped fire.

It is important to consider probable rehabilitation needs when selecting the appropriate suppression response. Tactics that reduce the need for rehabilitation are preferred whenever feasible.

## Suppression Responsibility

...safety is the highest priority. All action will be anchored to the standard fire orders and watch out situations. Safety will remain the responsibility of each person involved with the incident.

### Initial/Extended Attack

**Incident Commander** - To understand and carry out an appropriate suppression response which will best meet the land management objectives of the area at the least cost plus loss. Insure all forces used on the fire understand the plan for suppressing the fire in conjunction with MIST.

Keep in communication with responsible fire manager or line officer to insure understanding and support of tactics being used on the fire. Evaluate and provide feedback as to the tactical effectiveness during and after fire incident.

### Project Fire

**"Type I/II Incident Commander** - To carry out instructions given by the responsible line officer both verbally and through the Escaped Fire Situation Analysis (EFSA). Establish and nurture a close dialogue with the resource advisor assigned to the fire team. Review actions on site and evaluate for compliance with land line officer direction and effectiveness at meeting fire management protection objectives."

**Responsible Line Officer** - To transmit the land management objectives of the fire area to the fire team and to define specific fire management protection objectives. Periodically review for compliance.

**Resource Advisor** - To insure the interpretation and implementation of EFSA and other oral or written line officer direction are adequately carried out. Provide specific direction and guidelines as needed. Participate at fire team planning sessions, review incident action plans and attend daily briefings to emphasize resource concerns and management's expectations. Provide assistance in updating the EFSA when necessary. Participate in incident management team debriefing and assist in evaluation of team performance related to MIST.

## Guidelines

Following is a list of considerations for each fire situation.

### Hot-Line/Ground Fuels

- \* Allow fire to burn to natural barriers.
- \* Use cold-trail, wet line or combination when appropriate.
- \* If constructed fireline is necessary, use only width and depth to check fire spread.
- \* Consider use of fireline explosives for line construction.

- \* Burn out and use low impact tools like swatter or 'gunny' sack.
- \* Minimize bucking and cutting of trees to establish fireline; build line around logs when possible.
- \* Use alternative mechanized equipment such as excavators, rubber tired skidders, etc. rather than tracked vehicles.
- \* Use high pressure type sprayers on equipment prior to assigning to incident to help prevent spread of noxious weeds.
- \* Constantly recheck cold trailed fireline.

#### **Hot-Line/Aerial Fuels**

- \* Limb vegetation adjacent to fireline only as needed to prevent additional fire spread.
- \* During fireline construction, cut shrubs or small trees only when necessary. Make all cuts flush with the ground.
- \* Minimize felling of trees and snags unless they threaten the fireline or seriously endanger workers. In lieu of felling, identify hazard trees with a lookout or flagging.
- \* Scrape around tree bases near fireline if it is likely they will ignite.
- \* Use fireline explosives for felling when possible to meet the need for more natural appearing stumps.

#### **Mop-up/Ground Fuels**

- \* Do minimal spading; restrict spading to hot areas near fireline.
- \* Coldtrail charred logs near fireline; do minimal tool scarring.
- \* Minimize bucking of logs to extinguish fire or to check for hotspots; roll the logs instead if possible.
- \* Return logs to original position after checking and when ground is cool.
- \* Refrain from making bone yards; burned and partially burned fuels that were moved should be returned to a natural arrangement.
- \* Consider allowing large logs to burn out. Use a lever rather than bucking to manage large logs which must be extinguished.
- \* Use gravity socks in stream sources and/or a combination of water blivits and fold-a-tanks to minimize impacts to streams.
- \* Consider using infrared detection devices along perimeter to reduce risk.
- \* Personnel should avoid using rehabilitated firelines as travel corridors whenever possible, because of potential soil compaction and possible detrimental impacts to rehabilitation work, *i.e.*, water bars.

#### **Mop-up/Aerial Fuels**

- \* Remove or limb only those fuels which, if ignited, have potential to spread fire outside the fireline.
- \* Before felling consider allowing ignited tree/snag to burn itself out. Ensure adequate safety measures are communicated if this option is chosen.
- \* Identify hazard trees with a lookout or flagging.

- \* If burning trees/snags pose a serious threat of spreading fire brands, extinguish fire with water or dirt whenever possible. Consider felling by blasting when feasible. Felling by crosscut or chainsaw should be the last resort. Align saw cuts to minimize visual impacts from more heavily traveled corridors. Slope cut away from line of sight when possible.

## **Logistics**

### **Campsite Considerations**

- \* Locate facilities outside of wilderness whenever possible.
- \* Coordinate with the Resource Advisor in choosing a site with the most reasonable qualities of resource protection and safety concerns.
- \* Evaluate short-term low impact camps such as coyote or spike versus use of longer-term higher impact camps.
- \* Use existing campsites such as reserved sites used by outfitters, if possible.
- \* New site locations should be on impact-resistant and naturally draining areas such as rocky or sandy soils, or openings with heavy timber.
- \* Avoid camps in meadows, along streams or on lakeshores. Locate at least 200 feet from lakes, streams, trails, or other sensitive areas.
- \* Consider impacts on both present and future users. An agency commitment to wilderness values will promote those values to the public.
- \* Lay out the camp components carefully from the start. Define cooking, sleeping, latrine, and water supply.
- \* Minimize the number of trails and ensure adequate marking.
- \* Consider fabric ground cloth for protection in high use areas such as around cooking facilities.
- \* Use commercial portable toilet facilities where available. If these cannot be used, a latrine hole should be utilized.
- \* Select latrine sites a minimum of 200 feet from water sources with natural screening.
- \* Do not use nails in trees.
- \* Constantly evaluate the impacts which will occur, both short and long term.

### **Personal Camp Conduct**

- \* Use "leave no trace" camping techniques.
- \* Minimize disturbance to land when preparing bedding site. Do not clear vegetation or trench to create bedding sites.
- \* Use stoves for cooking, when possible. If a campfire is used, limit to one site and keep it as small as reasonable. Build either a "pit" or "mound" type fire. Avoid use of rocks to ring fires.
- \* Use down and dead firewood. Use small diameter wood, which burns down more cleanly.  
\*Don't burn plastics or aluminum - pack them out with other garbage.
- \* Keep a clean camp and store food and garbage so they are unavailable to bears. Ensure items such as empty food containers are clean and odor-free; never bury them.

- \* Select travel routes between camp and fire and define clearly. Carry water and bathe away from lakes and streams. Personnel must not introduce soaps, shampoos or other personal grooming chemicals into waterways.

### **Aviation Management**

One of the goals of wilderness managers is to minimize the disturbance caused by air operations during an incident.

#### **Aviation Use Guidelines**

- \* Maximize back haul flights as much as possible.
- \* Use long line remote hook in lieu of constructed helispots for delivery or retrieval of supplies and gear.
- \* Take precautions to insure noxious weeds are not inadvertently spread through the deployment of cargo nets and other external loads.
- \* Use natural openings for helispots and paracargo landing zones as far as practical. If construction is necessary, avoid high visitor use areas.
- \* Consider maintenance of existing helispots over creating new sites.
- \* Obtain specific instructions for appropriate helispot construction prior to the commencement of any ground work.
- \* Consider directional falling of trees and snags so they will be in a natural appearing arrangement.
- \* Buck and limb only what is necessary to achieve safe/practical operating space in and around the landing pad area.

#### **Retardant Use**

During initial attack, fire managers must weigh the non-use of retardant with the probability of initial attack crews being able to successfully control or contain a wildfire. If it is determined that use of retardant may prevent a larger, more damaging wildfire, then the manager might consider retardant use even in sensitive areas. This decision must take into account all values at risk and the consequences of larger firefighting forces' impacts on the land.

Consider impacts of water drops versus use of foam/retardant. If foam/retardant is deemed necessary, consider use of foam before retardant use.

### **Hazardous Materials**

#### **Flammable/Combustible Liquids**

- \* Store and dispense aircraft and equipment fuels in accordance with National Fire Protection Association (NFPA) and Health and Safety Handbook requirements.

- \* Avoid spilling or leakage of oil or fuel (from sources such as portable pumps) into water sources or soils.
- \* Store any liquid petroleum gas (propane) downhill and downwind from firecamps and away from ignition sources.

#### **Flammable Solids**

- \* Pick up residual fusees debris from the fireline and dispose of properly.

#### **Fire Retardant/Foaming Agents**

- \* Do not drop retardant or other suppressants near surface waters.
- \* Use caution when operating pumps or engines with foaming agents to avoid contamination of water sources.

#### **Fireline Explosives**

- \* Remove all undetonated fireline explosives from storage areas and fireline at the conclusion of the incident and dispose of according to Bureau of Alcohol, Tobacco and Firearms (BATF) and Fireline Blaster Handbook requirements. Properly dispose of all packaging materials.

### **Fire Rehabilitation**

Rehabilitation is a critical need. This need arises primarily because of the impacts associated with fire suppression and the logistics that support it. The processes of constructing control lines, transporting personnel and materials, providing food and shelter for personnel, and other suppression activities have a significant impact on sensitive resources, regardless of the mitigation measures used. Therefore, rehabilitation must be undertaken in a timely, professional manner.

During implementation, the resource advisor should be available for expert advise, support of personnel doing the rehabilitation work, and quality control.

#### **Rehabilitation Guidelines**

- \* Pick up and remove all flagging, garbage, litter, and equipment. Dispose of trash appropriately.
- \* Clean fire pit of unburned materials and fill back in.
- \* Discourage use of newly established trails created during the suppression effort by covering with brush, limbs, small diameter poles, and rotten logs in a naturally appearing arrangement.
- \* Replace dug out soil and/or duff and obliterate any berms created during the suppression effort.
- \* If impacted trails have developed on slopes greater than six percent, construct waterbars according to the following waterbar spacing guide:

<i>Trail Percent Grade</i>	<i>Maximum Spacing (feet)</i>
6-9	400
10-15	200
15-25	100
25+	50

- \* Where soil has been exposed and compacted, such as in camps, on user-trails, and at helispots and pump sites, scarify the top 2 to 4 inches and scatter with needles, twigs, rocks, and dead branches. It is unlikely that seed and fertilizer for barren areas will be appropriate, in order to maintain the genetic integrity of the area. It may be possible, depending on the time of year and/or possibility of a rainy period, to harvest and scatter nearby seed, or to transplant certain native vegetation.
- \* Blend campsites with natural surroundings, by filling in and covering latrine with soil, rocks, and other natural material. Naturalize campfire area by scattering ashes in nearby brush (after making sure any sparks are out) and returning site to a natural appearance.
- \* Where trees were cut or limbed, cut stumps flush with ground, and scatter limbs and boles out of sight in an unburned area. Camouflage stumps and tree boles using rocks, dead woody material, fragments of stumps, bolewood, limbs, soil and fallen or broken green branches. Scattered sawdust and shavings will assist in decomposition and be less noticeable. Use native materials from adjacent, unimpacted areas if necessary.
- \* Remove newly cut tree boles that are visible from trails or meadows. Drag other highly visible woody debris created during the suppression effort into timbered areas and disburse. Tree boles that are too large to move should be slant cut so a minimal amount of the cut surface is exposed to view. Chopping up the surface with an axe or pulaski, to make it jagged and rough, will speed natural decomposition.
- \* Leave tops of felled trees attached. This will appear more natural than scattering the debris.
- \* Consider using explosives on some stumps and cut faces of the bolewood for a more natural appearance.
- \* Consider, if no other alternatives are available, helicopter sling-loading rounds and tops from a disturbed site when there has been an excessive amount of bucking, limbing and topping.
- \* Tear out sumps or dams, where they have been used, and return site to natural condition. Replace any displaced rocks or streambed material that has been moved. Reclaim streambed to its predisturbed state, when appropriate. Walk through adjacent undisturbed area and take a look at the rehabilitation efforts to determine success at returning the area to as natural a state as possible. Good examples should be documented and shared with others!

### **Demobilization**

Because demobilization is often a time when people are tired or when weather conditions are less than ideal, enough time must be allowed to do a good job. When moving people and equipment choose a method which is most efficient and has the least impact on the landscape and fire organization mission. An on-the-ground analysis of "How Things Went" will be important.

## **Post-Fire Evaluation**

Post-fire evaluation is important for any fire occurrence so management can find out how things went in order to identify areas needing improvement, formulate strategies and produce quality work in the future. This activity is especially important in wilderness and like sensitive areas due to their fragility and inclination to long-term damage by human impacts.

Resource advisors and functional specialists such as wilderness rangers will be responsible for conducting the post-fire evaluation. They are the people who have the experience and knowledge to provide information required to make the evaluation meaningful and productive.

Post-fire evaluation will consist of data collection, documentation and recommendations. This process and report will, in most cases, be fairly simple and to the point. It should be accomplished before an overhead team departs from the fire. The evaluation emphasis should be on the MIST actions and not on the effects of the fire.

Evaluation will be completed on wildfires exceeding 100 acres and on a sample of fires less than 100 acres. It is appropriate to evaluate a diversity of fires, ranging from a spot fire suppressed by smokechasers or jumpers to a large project fire managed by an overhead team.

Region 1 is proposing a post-fire evaluation of sites, which includes data collection on campsites and helispots, using Cole's Site Inventory System report INT-259, "Wilderness Campsite Monitoring Methods: A Source Book." Data collected will be added to inventories already completed for recreational impacts on wilderness. This information should provide managers with a clearer picture of which activities affect these "last, best places."

### **Data Collection/Documentation/Recommendations**

This phase will be completed by a review of the rehabilitation plan and visit to the fire site as soon after demobilization as possible. An inventory of camps and helispots will be completed using Cole's Inventory System. This will also include an objective overview of other areas covered by the rehabilitation plan.

Observations will be documented in a brief report to the line officer with a copy to the appropriate incident commander. In the report, the evaluator will include recommendations for ensuing fire suppression activities on similar lands. It is important that the evaluator recognize and commend the initial attack forces or overhead team for positive activities. Make special note of the extra efforts and sensitivity to suppression impacts.

Below is a sample format for a Post-Fire Evaluation Report (**Note:** This report is reproduced in summary form):

**Post-Fire Evaluation for \_\_\_\_\_ Fire**

*Existing Direction Pertinent for Fire*

(insert general and specific land use plan direction for the management area, including guidance for management concerns such as threatened or endangered plants or animals)

*Findings*

A. Resource Advisor Input and/or Actions

(Include a synopsis of the actions of the resource advisor and his or her input into suppression strategies/tactics)

B. Escaped Fire Situation Analysis (EFSA)

(How did the EFSA respond to the sensitivities of this fire area.)

C. Line Direction to Incident Commander

(Synopsis of what the line officer told the incident commander to do.)

D. Incident Action Plan

(Synopsis of how incident action plan responded to fire area.)

*On-site Verification*

(State here who made the field visit, the date, and what observations were made in terms of meeting the guidelines for MIST.)

*Overall Review Evaluation*

(Include overall findings of how well objectives were accomplished in terms of minimum impact activities.)

*Review Recommendations*

(What areas can we improve on, where did we do well, etc.)

**Attachment 10: Leasable Minerals Stipulations**

The stipulations in this attachment are referred to by the following numbers:

1. All or part of lands are subject to Special Bureau of Land Management Stipulation Form ID 3100-21 (March 1983) (Oil and Gas Lease Stipulations).
2. All or part of lands are subject to Special Bureau of Land Management Wildlife Habitat Stipulation.
3. All or part of lands are subject to Special Bureau of Land Management No Surface Occupancy Stipulation.
4. All or part of lands are subject to Special State of Idaho Stipulation (Division of Highways).
5. All or part of lands are subject to Special Bureau of Land Management Stipulation (Slopes).
6. All or part of lands are subject to Special Bureau of Land Management Stipulation.
7. All or part of lands are subject to Special Known Phosphate Leasing Area Stipulation.
8. All or part of lands are subject to Special Idaho National Guard Stipulation.
9. All or part of lands are subject to Special Bureau of Land Management Stipulation (Phosphate).
10. All or part of lands are subject to Powersite Stipulation Form 3730-1 (July 1984).

**Stipulation Number 1 (Form ID 3100-21, March 1983)**

U.S. DEPARTMENT OF THE INTERIOR  
BUREAU OF LAND MANAGEMENT  
IDAHO STATE OFFICE

Serial No. \_\_\_\_\_

**OIL AND GAS LEASE STIPULATIONS**

**Endangered, Threatened, or Sensitive Species** - The Federal surface management agency is responsible for assuring that the leased land is examined prior to undertaking any surface-disturbing activities to determine effects upon any plant or animal species, listed or proposed for listing as endangered or threatened, or their habitats. The findings of this examination may result in some restrictions to the operator's plans or even disallow use and occupancy that would be in violation of the Endangered Species Act of 1973 by detrimentally affecting endangered or threatened species of [sic.] their habitats.

The lessee/operator may, unless notified by the authorized officer of the surface management agency that the examination is not necessary, conduct the examination on the leased lands at his discretion and cost. This examination must be done by or under the supervision of a qualified resources specialist approved by the surface management agency. An acceptable report must be provided to the surface management agency identifying the anticipated effects of a proposed action on endangered or threatened species or their habitats.

**Erosion Control** - Surface disturbing activities may be prohibited during muddy and/or wet soil period. This limitation does not apply to operation and maintenance of producing wells using authorized roads.

**Controlled or Limited Surface Use Stipulation** - This stipulation may be modified by special stipulations which are hereto attached or when specifically approved in writing by the District Manager, Bureau of Land Management, with concurrence of the Federal surface management agency. Distances and/or time periods may be made less restrictive depending on the actual on-ground conditions. The lessee should contact the Federal surface management agency for more specific locations and information regarding the restrictive nature of this stipulation.

The lessee/operator is given notice that the lands within this lease may include special areas and that such areas may contain special values, may be needed for special purposes, or may require special attention to prevent damage to surface and/or other resources. Possible special areas are identified below. Any surface use or occupancy within such special areas will be strictly controlled or, if absolutely necessary, excluded. Use or occupancy will be restricted only when the Bureau of Land Management and/or the surface management agency demonstrates the restriction necessary for the protection of such special areas and existing or planned uses.

Appropriate modifications to imposed restrictions will be made for the maintenance and operations of producing oil and gas wells.

After the Federal surface management agency has been advised of specific proposed surface use or occupancy on the leased lands, and on request of the lessee/operator, the Agency will furnish further data on any special areas which may include:

100 feet from the edge of the rights-of-way of highways, designated county roads and appropriate federally-owned or controlled roads and recreation trails.

500 feet, when necessary, within the 100-year flood plain of reservoirs, lakes, and ponds and intermittent, ephemeral or perennial streams; rivers, and domestic water supplies.

500 feet from grouse strutting grounds. Special care to avoid nesting areas associated with strutting grounds will be necessary during the period from March 1 to June 30. One-fourth mile from identified essential habitat of state and federal sensitive species. Crucial wildlife winter ranges during the period from December 1 to May 1.

300 feet from occupied buildings, developed recreational areas, undeveloped recreational areas receiving concentrated public use and sites eligible for or designated as National Register sites.

Seasonal road closures, roads for special uses, specified roads during heavy traffic periods and on areas having restrictive off-road vehicle designations.

Slopes over 30 percent, or 20 percent on extremely erodible or slumping soils.

Federally owned or controlled springs, reservoirs, wells, or other water sources.

**Stipulation Number 2**

**Special BLM Stipulation**

**Wildlife Habitat**

In order to protect \_\_\_\_\_, exploration, drilling and other development activity will be allowed only from \_\_\_\_\_ to \_\_\_\_\_. This limitation does not apply to maintenance and operation of producing wells. Exceptions to this limitation in any year may be specifically authorized in writing by the District Manager, Bureau of Land Management.

\* \* \* \* \*

**Stipulation Number 3**

**Special BLM No Surface Occupancy Stipulation**

No occupancy or other surface disturbance will be allowed within \_\_\_\_\_. This distance may be modified when specifically approved in writing by the District Manager, Bureau of Land Management.

**Stipulation Number 4**

Serial No. \_\_\_\_\_

**Special State of Idaho Stipulations**

**Division of Highways**

The undersigned lessee accepts this lease subject to the following prohibitions unless said prohibitions are waived in whole or in part in writing and approved by the State Highway Administrator.

Right of Way of Public Roads

No buildings or structures will be erected within the right-of-way boundaries of any state highway.

No equipment or materials storage or drilling and/or exploratory operations will be conducted within the right-of-way of a state highway.

Borrow Sources, Stockpile and Maintenance Sites

No buildings or structures, equipment or material storage, or drilling and/or exploratory operations will be allowed within the boundaries of any borrow, aggregate, stockpile, quarry or maintenance site except by specific written waiver of this prohibition as outlined above.

This lease includes Material Site \_\_\_\_\_.

\* \* \* \* \*

**Stipulation Number 5**

Serial No. \_\_\_\_\_

**Special BLM Stipulation**

No occupancy or other surface disturbance will be allowed on slopes in excess of 30 percent, or in excess of 20 percent on extremely erodible or slumping soils, without approval of the authorized officer of the Bureau of Land Management.

**Stipulation Number 6**

Serial No. \_\_\_\_\_

**Special BLM Stipulation**

All of the lands in the following legal subdivisions are included in \_\_\_\_\_  
\_\_\_\_\_. Therefore, no occupancy or disturbance of the surface  
of the land described is authorized. The lessee, however, may exploit the oil and gas resources  
by directional drilling from sites outside the area.

\* \* \* \* \*

**Stipulation Number 7**

Serial No. \_\_\_\_\_

**Special BLM Stipulation**

**Known Phosphate Leasing Area**

Exploration or development operations for oil and gas conducted under this lease shall be planned so as to prevent unreasonable interference with present or future exploration of phosphates or phosphate rock and associated or related minerals. Prior to conducting such operations under this lease, the lessee shall consult with, or otherwise advise the phosphate lessee or permittee of his proposed plans and obtain the phosphate lessees' or permittees' comments on the proposed operations. Evidence of such consultation and any comments resulting therefrom shall be submitted to the Authorized Officer of the BLM, with the submission of proposed plans of operations involving exploration for, or development of, oil and gas.

**Stipulation Number 8**

Serial No. \_\_\_\_\_

**Idaho National Guard Stipulations**

The Idaho National Guard has requested the following stipulations be incorporated into all oil and gas leases issued in an area used by them as a firing and maneuver range.

STIPULATIONS:

1. That the Idaho National Guard be furnished with detailed plans for all exploration and construction/operations activity planned by the lessee at least 60 days prior to its commencement. This stipulation is for the specific purpose of evaluation by the Idaho National Guard of any impact on safety and ecological considerations and to provide an opportunity for reclamation when it is deemed appropriate.
2. That roads and trails in the area remain open for use by the National Guard. If closures are made, proper advance notification will be required and an alternate route established.
3. That no area fence closures be built, other than around the immediate vicinity of the construction/operation activity, to preclude the use of an entire section by the National Guard.
4. That the Federal Government (all agencies), the State of Idaho, and the Idaho National Guard be immuned from liability for any injuries or damage to property resulting from the explosion of military ammunition and/or explosives. While every effort is made to destroy ammunition "duds" in the range area, live ammunition has been fired into the impact area for many years. There is no way it can be guaranteed that this area is free from all unexploded rounds, explosives, and devices.

**Stipulation Number 9**

Serial No. \_\_\_\_\_

**Special BLM Stipulation**

Exploration or development operations for oil and gas conducted under this lease shall be planned so as to prevent unreasonable interference with present or future exploration of phosphates or phosphate rock and associated or related minerals. Prior to conducting such operations under this lease, the lessee shall consult with, or otherwise advise the phosphate lessee or permittee of his proposed plans and obtain the phosphate lessees' or permittees' comments on the proposed operations. Evidence of such consultation and any comments resulting therefrom shall be submitted to the Authorized Office of the BLM, with the submission of proposed plans of operations involving exploration for, or development of, oil and gas.

**Stipulation Number 10 (Form 3730-1)**

U.S. DEPARTMENT OF THE INTERIOR  
BUREAU OF LAND MANAGEMENT

**POWERSITE STIPULATION**

(Form 3730- 1; July 1984)

The lessee or permittee hereby agrees:

(a) If any of the land covered by this lease or permit was, on the date the lease or permit application or offer was filed, within a powersite classification, powersite reserve, waterpower designation, or project on which an application for a license or preliminary permit is pending before the Federal Energy Regulatory Commission or on which an effective license or preliminary permit had been issued by the Federal Energy Regulatory Commission under the Federal Power Act, or on which an authorized power project (other than one owned or operated by the Federal Government) had been constructed, the United States, its permittees or licensees shall have the prior right to use such land for purposes of power development so applied for, licensed, permitted, or authorized and no compensation shall accrue to the mineral lessee or permittee for loss of prospective profits or for damages to improvements or workings, or for any additional expense caused the mineral lessee as a result of the taking of said land for power development purposes. It is agreed, however, that where the mineral lessee or permittee can make adjustments of his improvements to avoid undue interference with power development, he will be permitted to do so at his own expense. Furthermore, occupancy and use of the land by the mineral lessee or permittee shall be subject to such reasonable conditions with respect to the use of the land as may be prescribed by the Federal Energy Regulatory Commission for the protection of any improvements and workings constructed thereon for power development.

(b) If any of the land covered by this lease or permit is on the date of the lease or permit within a powersite classification, powersite reserve, or waterpower designation which is not governed by the preceding paragraph, the lease or permit is subject to the express condition that operations under it shall be so conducted as not to interfere with the administration and use of the land for powersite purposes to a greater extent than may be determined by the Secretary of the Interior to be necessary for the most beneficial use of the land. In any case, it is agreed that where the mineral lessee or permittee can make adjustments to avoid undue interference with power development, he will be permitted to do so at his own expense.

## Attachment 11: Summary of the Chilly Slough Wetland Conservation Project

(Summarizes the Chilly Slough Wetland Conservation Project Plan and the Thousand Springs/Chilly Slough Habitat Management Plan)

The Chilly Slough Wetland Conservation Project is a joint effort by the BLM, the Idaho Department of Fish and Game, The Nature Conservancy, and Ducks Unlimited, Inc. (the Chilly Slough Working Group) to acquire and manage a high value natural wetland for wildlife and recreational purposes. The project area is located in T.9N. and T.10N., R.21E. and R.22E., Custer County, Idaho (see *Map 18: Chilly Slough Wetland Conservation Project Area*).

Chilly Slough's values include the following: (1) breeding habitat for waterfowl, sandhill cranes, and long-billed curlews; (2) a natural wetland, physically unaltered by mechanical manipulation; (3) storage and release of ground and surface water; (4) livestock pasture; (5) maintenance of downstream water quality; and (7) a rainbow and brook trout fishery.

Production of waterfowl, fish, and nongame wildlife in the project area is limited by habitat condition and a lack of residual nesting cover. Fractured public and private land ownership patterns preclude opportunities to improve habitat condition and waterfowl nesting cover on the wetland.

The project is needed to (1) increase breeding populations of waterfowl, sandhill cranes, and nongame wildlife in the project area, and (2) perpetuate and protect wetland values that would otherwise remain below potential or be threatened by existing and future land use practices.

The conservation project primarily consists of:

1. Acquiring up to 3,200 acres of private lands through land exchanges or fee simple purchase on a willing-seller basis only, thereby creating a wetland management area of approximately 4,400 acres.
2. Constructing new fences and reconstructing or removing old fences to facilitate livestock control and increase residual nesting cover.
3. Creating, where feasible, additional open-aquatic habitat to provide breeding and brood-rearing habitat for waterfowl and other species.
4. Developing a viewing site for watching wildlife.
5. Vegetation treatments, in the form of prescribed burning, livestock grazing, or other methods jointly approved of by the project cooperators, which may be used where such methods are determined to be consistent with the achievement of wetland conservation objectives.

## Attachment 12: Procedure for Nonpoint Source Consistency Review

The "Procedure for Nonpoint Source Consistency Review" for the Challis RMP is based upon the following sources:

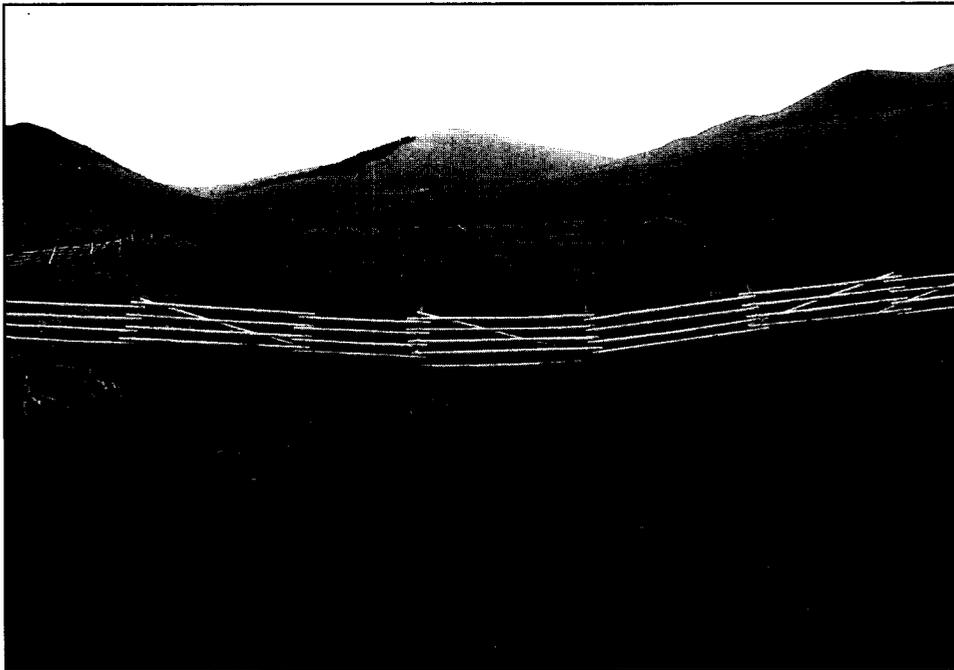

- (a) Memorandum of Understanding implementing the Nonpoint Source Water Quality Program of the State of Idaho (1992).
  - (b) Idaho Nonpoint Source Management Program (1989).
  - (c) Selected elements of the Idaho code referenced in the Idaho Nonpoint Source Management Program.
  - (d) Idaho State Office BLM Information Bulletin Number ID-91-853.
  - (e) Idaho Agricultural Pollution Abatement Plan (Idaho Dept. of Health and Welfare/Idaho Dept. of Lands 1993)
- 
1. Identify nonpoint source activity.
  2. Identify any water quality limited stream segment (see *Glossary*, p. 186) within the project area.
  3. Identify any Outstanding Resource Water (ORW) within the project area.
  4. Identify beneficial uses and indicate those "official designated" beneficial uses in the Idaho Water Quality Standards. Provide those beneficial uses identified and not officially designated to the Idaho Department of Environmental Quality for review and concurrence.
  5. Identify water quality standards and criteria applicable to protecting the appropriate beneficial uses.
  6. Identify current status of beneficial uses and predicted condition of beneficial uses, by providing an analysis of changes in habitat resulting from the nonpoint source activity which may impact the beneficial use.
  7. Establish interim and long term site-specific water quality/riparian objectives to support identified beneficial uses.
  8. Identify State approved BMPs, if any, for each nonpoint source activity.
  9. Develop site-specific management systems and identify component strategies that demonstrate a knowledgeable and reasonable effort to meet the water quality objectives and minimize resulting water quality impacts.

10. Document the rationale and scientific basis for the management system and component practices identifying why the system will, or has been demonstrated to, protect or restore water quality, promote riparian improvement, and meet defined water quality objectives and Idaho Water Quality Standards.
11. Identify expected timeframe in which water quality objectives may be met.
12. Develop standards to measure and document implementation of the management strategies.
13. Develop a schedule for implementing component practices and a feedback loop compliance schedule.
14. Develop a monitoring plan which will provide adequate information to determine the effectiveness of the management strategies in achieving the water quality objectives and protecting the beneficial uses of the water.
15. Define a methodology or process, using feedback data from water quality monitoring, by which component practices of the management system may be modified, strengthened, or revised to meet water quality goals and protect beneficial uses of water.
16. Provide an opportunity for review by the Department of Environmental Quality (DEQ) for consistency and compliance with the Idaho Nonpoint Source Management Program and the Idaho Water Quality Standards.

### **Attachment 13: Riparian Study Area Development**

(Referred to in Riparian Areas, Goal 2, #3, p. 81)

1. Sites would be chosen by a BLM interdisciplinary team.
2. The riparian study area would help ranchers and land managers to
  - (a) determine potential for riparian improvement,
  - (b) compare management strategies and progress with control areas, and
  - (c) indicate changes over time due to natural influences (e.g., climate).
3. The study areas would be a minimum of 400 feet in length or 20 times the bankfull width, whichever is larger.
4. The study areas would generally contain the entire width of the riparian area.
5. The total area of each individual study area would generally be two acres or less and should not exceed five acres.

*Road Creek Exclosure*

### Attachment 14: Procedures for Minimum Streamflow Application

(Referred to in Minimum Streamflow, Goal 1, #2, p. 67)

1. In cooperation with the IDFG, the Idaho Department of Parks and Recreation, or other outside interests, determine appropriate actions for obtaining a minimum streamflow on salmon, steelhead trout, and bull trout streams in the area, consistent with the resource values involved (see Fisheries, Goal 1, pp. 45-47). Review existing information available as a result of previous instream flow studies conducted by the IDFG.
2. During the year after signing of the Challis RMP, identify and prioritize streams within the Challis Resource Area for which minimum streamflow rights will be crucial to maintenance or improvement of fish and riparian habitat. Begin with the following list of streams:

East Fork Salmon River  
Lake Creek  
Herd Creek  
Salmon River  
Squaw Creek  
Thompson Creek  
Bayhorse Creek  
Garden Creek

Challis Creek  
Road Creek  
Pahsimeroi River  
Big Creek  
Morse Creek  
Falls Creek  
Little Morgan Creek  
Burnt Creek.

3. One year after signing of the Challis RMP, begin gathering a minimum of three years of flow data on the priority streams, focusing first on those streams with existing adequate data. Make application and/or assist in application preparation (according to Idaho code section 42-1501 to 42-1505) on at least one identified stream. Add one stream per year to the data collection and application process indefinitely, until minimum streamflow needs are satisfied.

**Attachment 15: Minimum Riparian and Aquatic Habitat Conditions**

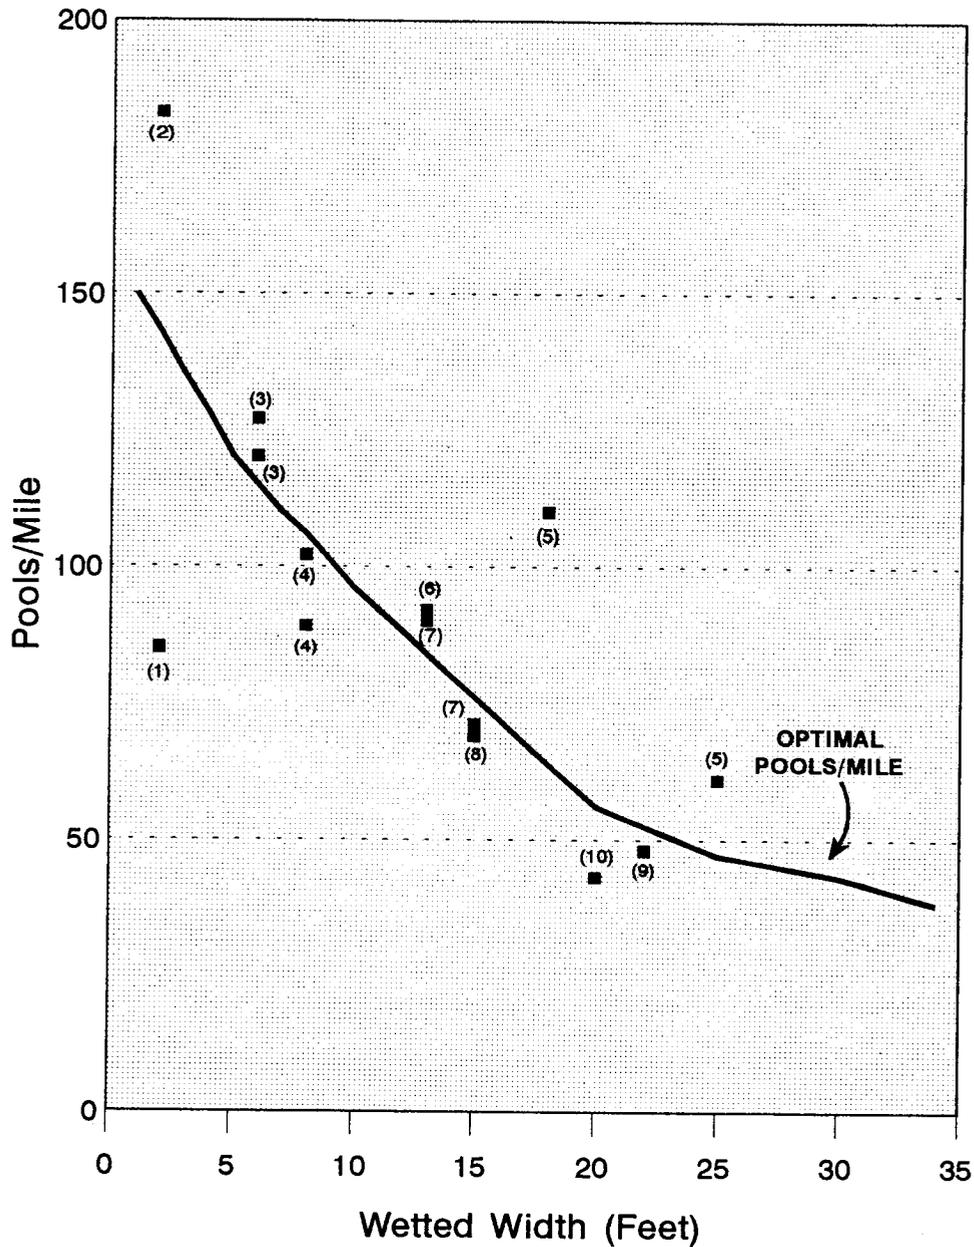

Note: These conditions would be applied to all fish-bearing streams in the Challis Resource Area (see *Map 2: Anadromous and Resident Fisheries Occupied Habitat*.) These conditions may be altered (1) as reference information to natural conditions in similar channel types and geomorphology is improved, or (2) on a case-by-case basis when a watershed or site-specific assessment conducted by an ID team indicates alternative conditions are more appropriate. Rationale for changes to the minimum conditions must be properly documented.

- (a) Pools/mile: commensurate with wetted width (see *Glossary*, p. 187 and *Attachment 16: optimal pools/mile curve*, p. 150):

wetted width (feet):	10	20	25	50	75	100	125	150	200
number of pools/mile:	96	56	47	26	23	18	14	12	9

- (b) Streambank stability: >90%.
- (c) Lower bank angle: >75% of banks with a <90° angle (i.e., undercut).
- (d) Width:depth ratio: <10 measured at maximum pool depth within wetted width.
- (e) Temperature standards:
  - (1) Within designated critical habitat for anadromous fish (see *Glossary*, p. 167), no measurable increase in maximum water temperature (defined as a 7-day moving average of daily maximum water temperature over the warmest consecutive 7-day period) shall occur as a result of Federal land management activities. Maximum water temperatures must be below 64 °F within migration and rearing habitats and below 60 °F within spawning habitats (unless the bull trout temperature standards described in (3) below would apply).
  - (2) In watersheds not considered designated critical habitat for anadromous fish, management activities may not contribute to increased maximum water temperatures above 64° F within fish migration, spawning, and rearing habitats (unless the bull trout temperature standards described in (3) below would apply).
  - (3) Bull trout temperature criteria shall apply to all tributary waters, not including fifth order main stem rivers, located within the Thompson/Bayhorse creeks, Pahsimeroi River, and East Fork Salmon River drainages (Batt 1996: F-5), as well as Squaw, Morgan, and Challis creeks. Water temperatures shall not exceed a 53.6 °F daily average during June, July, and August for juvenile bull trout rearing, and a 48 °F daily average during September and October for bull trout spawning. For the purposes of measuring these criteria, the daily average shall be generated from a recording device with a minimum of six evenly spaced measurements in a 24-hour period (IDAPA 16, Title 01, Chapter 02, Subsection 250.02 e., p. 40; February 20, 1998).
- (f) Cobble embeddedness for resident and anadromous fish habitat: <20% (see *Glossary: cobble embeddedness*, p. 168).

## Attachment 17: Tracts Considered for Sale

**Note:** This attachment lists tracts which are proposed for consideration as sale tracts under Land Tenure and Access, Goal 2, #3, p. 55.

Within the adjustment areas (see *Map A: Adjustment/Management Areas*) approximately 3,324.63 acres would be considered for sale, because they are difficult and uneconomical to manage (FLPMA, Section 203(a)(1)):

## Attachment 18: Wild and Scenic Rivers Study

Through the Wild and Scenic Rivers (W&SR) Act (PL 90-542, as amended) Congress has declared, "... that the established national policy of dam and other construction at appropriate sections of the rivers of the United States needs to be complemented by a policy that would preserve other selected rivers or sections thereof in their free-flowing condition to protect the water quality of such rivers and to fulfill other vital national conservation purposes."

In 1993 the Challis Resource Area - BLM completed an inventory to determine which rivers flowing through BLM-administered lands within the Challis Resource Area would be eligible for further study for possible inclusion in a national rivers system. The results of that inventory and evaluation were first published in an eligibility report in July 1992. Following an open comment period, a revised eligibility report was published in March 1993, with an addendum in June 1993 which incorporated additional public comments. Details of the process and criteria used to determine eligibility (including outstandingly remarkable values and free-flowing characteristics), information on recommended tentative river classifications as wild, scenic, or recreational, and other elements of the eligibility evaluation are on file in the Salmon Field Office and may be reviewed upon request. Those eligible rivers were then included in a "suitability" study, which was part of the Challis Draft Resource Management Plan (DRMP, Volume 2, pp. 392a-399b). Results of that study are included in the PRMP (see Wild and Scenic Rivers, pp. 98-100). Rivers that are found suitable in the approved RMP may be recommended to Congress for inclusion in the National Wild and Scenic Rivers System, at the discretion of the Idaho BLM State Director.

The BLM considered many factors in determining the suitability of each eligible segment for inclusion in a national rivers system. Those factors included such things as the length of the segment, outstandingly remarkable (OR) values present within the river corridor, floatability, flow status, importance to the suitability of other segments, water development potential, the BLM's ability to manage the segment as a designated river, other opportunities to manage the OR values present, commitment of other involved land owners in sharing administration of the segment, identified support of or opposition to designation, consistency with other approved plans, and estimated potential costs of administering the segment, if designated. Documentation of the Challis Resource Area's consideration of these factors during the suitability study is on file in the Salmon Field Office and may be reviewed upon request.

In addition to considering the qualities of the river segment and its corridor, the BLM recognized that proposing that a river segment be found suitable for designation as part of a national rivers system is also an issue of allocation. For example, a river segment may have numerous OR values present within the river corridor, but because of other issues such as current or proposed uses in or near the corridor, the BLM may have chosen not to allocate that river for management as a national wild, scenic, or recreational river. In those cases the rivers were found unsuitable. Although the free-flowing character of the river, the presence and importance of OR values, and the protection that would be afforded under the W&SR Act were given heavy consideration, they were not viewed as circumstances that would require a finding of "suitable" on any given river segment. The BLM understood the charge of the W&SR Act to be to determine which, if any,

river segments within the planning area would be suitable for inclusion in a national river system and to prescribe management that would protect those rivers' qualities.

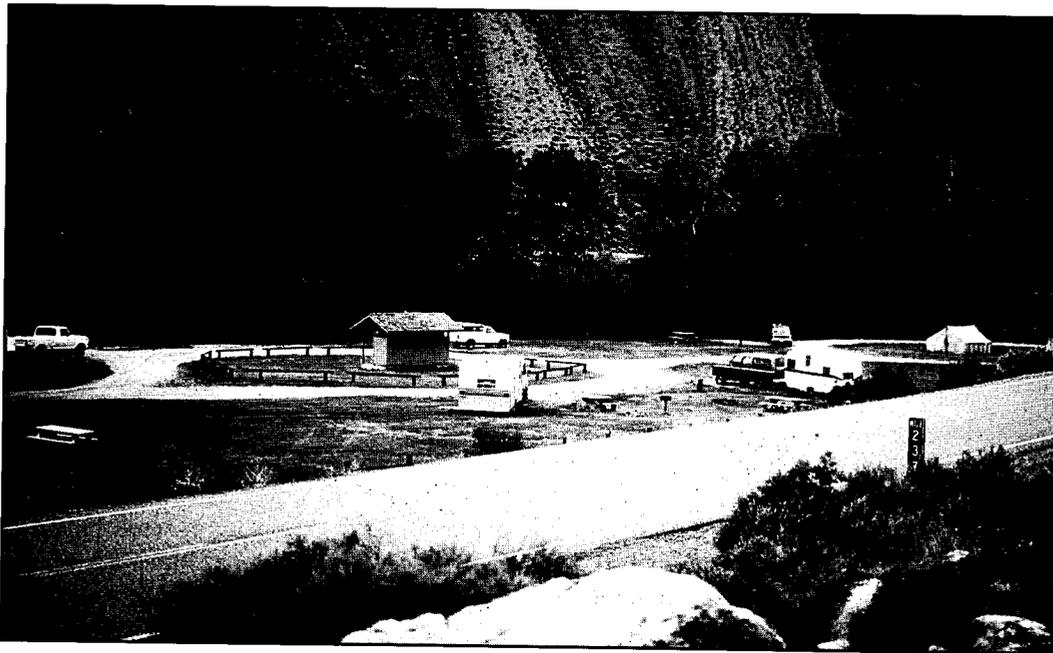

While a suitability finding was completed on most of the eligible river segments, a suitability finding on some segments was deferred to later coordinated river studies. Section 5(c) of the W&SR Act states its intent for coordinated river study: "The study of any of said rivers shall be pursued in as close cooperation with appropriate agencies of the affected State and its political subdivisions as possible, shall be carried on jointly with such agencies if request for such joint study is made by the State, and shall include a determination of the degree to which the State or its political subdivisions might participate in the preservation and administration of the river should it be proposed for inclusion in the national wild and scenic river system."

In 1991 Idaho BLM State Director entered into a Memorandum of Understanding (MOU) with the Governor, State of Idaho, and Regional Foresters of the Northern and Intermountain Regions of the Forest Service. The purpose of the MOU is to "formalize a cooperative relationship for conducting river planning efforts and Wild and Scenic Rivers Studies of Idaho's rivers; among the State of Idaho, the Forest Service, and Bureau of Land Management. It affirms commitments to: prioritize Federal Wild and Scenic Rivers Studies and coordinate Federal studies with State planning activities; share data and planning resources between State and Federal water resource planning agencies; and coordinate public education and information outreach programs." Further, in 1992 the affected Forest Supervisors, BLM District Manager, and Idaho Department of Water Resources representative entered into a Study Agreement whose purpose "is to coordinate river basin planning activities in the Upper Salmon River Basin consistent with the MOU dated February 14, 1991 between the signatory agencies. This will include definition of the study area, designation of agency roles, timing and funding for the planning process, collection and sharing of data, and implementing procedures." Three of the rivers included in the study agreement are the Pahsimeroi River, the East Fork Salmon River, and the Main Salmon River. As a result of these agreements, the Challis PRMP deferred completion of the suitability study for these rivers to a coordinated study effort.

In addition to the Main Salmon, East Fork Salmon, and Pahsimeroi rivers, the Challis PRMP also deferred a suitability finding on nine other segments (as listed on pp. 99-100 of the PRMP) which are closely linked to and should be studied with the three main deferred rivers, would be suitable only as part of a system, or are logical extensions of river segments administered by the Forest Service or Upper Snake River District BLM. The BLM deferred a suitability finding on these segments until later coordinated study because studying only the portion of a river which is BLM-managed would not present a complete picture of the suitability of the entire river reach.

### **Attachment 19: Approved Methods for Waste Disposal**

1. Sanitation facilities would be provided at the intensely-used recreation sites along the rivers and disposal of human waste would only be allowed at the provided sanitation facilities. Camping parties along the river must pack out their solid waste in porta-potties or in one of the rocket box systems commonly used by river outfitters.
2. People would be required to pack out and dispose of their litter properly.
3. Fires would only be allowed in designated fire rings in the campgrounds or recreation sites, or in approved fire pans commonly used by river outfitters along the river. If a party built a fire in a fire pan, they would be required to completely extinguish all embers and pack out the ashes.

*Bayhorse Campground near Challis, Idaho*

## Attachment 20: Criteria for Road Maintenance Levels

**Note:** The following codes for road maintenance levels are from the "Facility Inventory Maintenance Management System Manual," November 22, 1989, pages 21 and 22. Levels are listed from highest level of maintenance (level 5) to lowest level of maintenance (level 1). At present, road surfaces on BLM roads within the Challis Resource Area are maintained at levels 3, 2, or 1.

<b>Level</b>	<b>Description</b>
5	This level of maintenance is for collector, double lane, aggregate or bituminous surface roads with an average daily traffic greater than 15. Safety and comfort are important considerations. In addition to a scheduled maintenance program, these roads have a preventative maintenance program established to maintain the integrity of the system.
4	This level is used on roads which are generally kept open year around or on high-use seasonal roads. Driver safety and convenience are more important considerations than for level 3 roads. Roads in this maintenance level are typically double lane with a native or aggregate surface. The roadway is maintained on a scheduled basis. A preventative maintenance program may also be established. Problems are repaired as soon as discovered.
3	This level is for roads which are seasonal in nature or occasionally open year around. Traffic volumes approach an average daily traffic of 15 vehicles. Roads are typically single lane with an aggregate or native surface. Roads are maintained as needed to keep drainage functional, maintain roadway prism, maintain sight distance, and consider driver safety and convenience.
2	This level is used for roads where management requires a road to be open seasonally for limited passage of traffic. Traffic is generally administrative, with some minor specialized use or moderate seasonal use. Maintenance is minimal, and includes brush and obstruction removal, maintenance of drainage facilities, and minimum maintenance of road prism.
1	This level is for roads which only receive basic custodial care required to protect the road investment and/or adjacent lands and resource values. Normally, these roads are blocked and not open for traffic, or are only open to restricted traffic. Closure and traffic restrictive devices are maintained. Primitive roads receive no roadbed maintenance. On other roads, culverts, waterbars, and other drainage facilities are maintained. Slides, fallen trees, and brush are left unless they affect roadbed drainage.

### Attachment 23: Beneficial Use Classifications for Drainage Segments

Beneficial use classifications for streams in the Big Lost River, Little Lost River, East Fork Salmon River, Pahsimeroi River, and Main Salmon River drainages are shown below. In addition to the classifications listed below, Bruno Creek in the Main Salmon River is identified by the BLM as an "industrial water supply" beneficial use. No streams in the above drainages are classified as an "outstanding resource waters" beneficial use. Listed beneficial uses were either identified by the BLM (shown with an "X") or published in the Idaho Department of Health and Welfare, Division of Environmental Quality, Title 01, Chapter 02, "Water Quality Standards and Wastewater Treatment Requirements," February 1998.
