## Chains.

Survey commenced Dec. 13, 1910, and executed with a W. & L. E. Gurley light mountain transit, special make, unnumbered, with Burt's patent solar attachment. The horizontal limb of the instrument is provided with two double verniers, placed opposite to each other, and each reading to  $1'$  of arc, which is also the least reading of the verniers of the latitude and declination arcs. At the cor. of secs. 1, 2, 35 & 36, on the south bdy. of the Tp., as established by me, and heretofore described, I examine and test carefully all the adjustments of the transit and solar attachment, and finding all parts of the instrument in correct and accurate adjustment as to tests; then, in order to test the solar apparatus, by comparing the results of observations on the sun, for meridian, made during p.m. & a.m. hours, respectively, with a true meridian determined by Polaris observation, I proceed as follows : -

At 4h 15m p.m., l.m.t., at the cor. above described, in lat.  $35^{\circ} 35' 47''$  N., long.  $113^{\circ} 56' 59''$  W., I set off  $23^{\circ} 5'$  S. on the decl. arc, and  $35^{\circ} 36'$  N. on the lat. arc, and determine a meridian with the solar, and mark a point in the meridian thus determined by a tack in a stake driven firmly in the ground 5 chs. N. of my station.

Dec. 13, 1910.

Dec. 14, 1910. /

At 1h 56m a.m., l.m.t., I observe Polaris at W. elongation, in accordance with instructions in the "manual", and mark the line thus determined by a tack in a stake driven firmly in the ground 6 chs. N. of my station. At 8h a.m., l.m.t., I set off the azimuth of Polaris,  $1^{\circ} 26'$  to the East, and mark the true meridian thus determined by a tack in the stake 5 chs. N. of my station, which point falls .48 ins. E. of the point as determined by the solar on the preceding evening. At 8h 30m a.m., l.m.t., I set off  $23^{\circ} 9'$  S. on the decl. arc, and  $35^{\circ} 36'$  N. on the lat. arc, and determine a meridian with the solar, and mark a point in the meridian thus determined by a tack in the stake 5 chs. N. of my station, which point falls .35 ins. E. of the point in the meridian determined by Polaris observation. The solar apparatus, by p.m. & a.m. hours observations, defines positions for meridians, about  $25''$  W., and  $19''$  E., respectively, of the true meridian as determined by Observation of Polaris.

These small errors being no more than the usual errors of observation with solar instruments, I conclude that my instrument is in satisfactory adjustment.

The magnetic bearing of the true meridian at 8h 30m a.m., is N.  $15^{\circ} 25'$  W.; the angle thus determined gives the magnetic declination as  $15^{\circ} 25'$  E.

From the cor. above described,  
I run, as per instructions ;

General Description, T. 26 N., R. 16 W.

This Tp. is somewhat rolling and broken in the NE., slightly undulating in places in the SE. & SW., and barren and level in the NW. portions. The soil is in general a loose, sandy loam, heavy with some clay in places, and in the SW. portion of the Tp. is underlaid with a calcareous gravel. The greater portion of the Tp. is covered with a fair growth of native grass, dense in places. All the land in the Tp. would produce well, if irrigated. There is no water or timber in the Tp., and no trace of any settlers. A part of the NW. portion lies in what is called Red Lake, a dry barren flat, which at times of very heavy rains is flooded with a few inches of water, but at no place to such a depth as would destroy the corners set by me in the part subject to flooding. Therefore, I considered it unnecessary to meander this barren, dry, lake. There are no indications of a mineral character in the Tp.
