

Top: Most of these trees are greater than the 30" DBA the canopy is thin and the undergrowth is dense vegetation but not much regeneration of conifers. The canopy has been left too thin. This is actually on the top of 19-1 which has been pulled from the sale, but a good example of the long recovery time. Also many trees looked compromised.

Objectives of this treatment are to “conserve and improve survivability of older trees (over 150) by reducing nearby fuels and competitive vegetation.” These trees don’t appear healthy.

\*\*\*\*\*

While I don’t want to “chat” over individual trees--this was a concern. The tree on the right is not marked as a save tree (19-1) as the tree

next to it is. This tree contains a marked birds nest quite high. If you follow the line you will see a white ribbon with red dots. This is the same tree not marked as a keep.
