

The Wolf Flower

The Lupine is named after “Lupus,” the Latin word for wolf!

Lupine

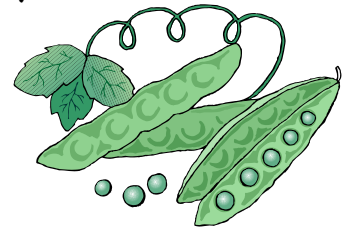

Why is it Named After the Wolf?

Lupine is poisonous. When this plant was named, people thought that both the wolf and the plant killed livestock.

Although lupine is poisonous, it is an important part of a healthy habitat. After a forest fire, Lupine grows rapidly and puts vitamins and nutrients back into the soil. This helps the forest grow!

The Lupine has blue and white flowers and seeds that look like pea pods. It is in the pea family!

They may look like peas, but don't be foolish and try to eat one. They will make you very sick!

Lupine's fanlike leaves look like the fingers on a hand.

***Remember! Spare a flower, share a flower!
If you pick a flower, no one else can enjoy its beauty.***
