Open File Reports

Open file reports present the results of inventories or other investigations published outside the formal BLM-Alaska technical publication series. These reports can include preliminary or incomplete data and are not published and distributed in quantity. Copies of this report may be obtained from the Juneau-John Rishel Minerals Information Center at 100 Savikko Rd., Mayflower Island, Douglas, AK 99824, by calling (907) 364-1553, or by faxing (907) 364-1574. Related publications are available on the Internet at <http://juneau.ak.blm.gov>.

Copies are also available for inspection at the Alaska Resources Library and Information Services in Anchorage, at various libraries of the University of Alaska, at other Federal and State agencies in Alaska, at the USDI Natural Resource Library in Washington, D.C., and at the BLM Service Center Library in Denver

ABSTRACT

In 2003, the Bureau of Land Management (BLM) completed the third year of the Delta River Mining District study. Investigators surveyed, mapped, or sampled 51 mineral occurrences in the 2.9-million-acre Delta River Mining District, which extends across the Alaska Range from Paxson to Delta Junction, in east-central Alaska. The BLM collected and analyzed 446 rock chip, placer, pan concentrate, and stream sediment samples during the investigation. Fieldwork for the Delta River Mineral study is scheduled to be completed in 2004 with a final report being produced in 2005.

INTRODUCTION

As part of the Delta River Mining District study personnel from the Division of Energy and Solid Minerals of the Bureau of Land Management - Alaska (BLM) conducted mineral investigations in the 2.9-million-acre Delta River Mining District in 2003. The investigations are part of the BLM's ongoing mineral assessment program of public land in Alaska as authorized by the U.S. Congress in Section 1010 of the Alaska National Interest Lands Conservation Act (ANILCA) which reads:

“Section 1010(a): MINERAL ASSESSMENTS.- The Secretary shall, to the full extent of his authority, assess, the oil, gas, and other mineral potential on all public lands in the State of Alaska in order to expand the data base with respect to the mineral potential in such lands...”

Goals of BLM mineral assessments are to compile, analyze, and publicize mineral information to facilitate multiple-use management of the area. Mineral information includes mineral occurrence surveying, mapping, and sampling; airborne and ground-based geophysics; stream sediment geochemistry; and economic, engineering, and environmental analysis. The BLM is scheduled to complete fieldwork for the mineral assessment of the district in 2004 and produce a final report in 2005.

The Delta River Mining District extends across the eastern Alaska Range from about Delta Junction on the north to Paxson on the south. It is accessible via the Richardson, Denali, and Alaska highways (fig. 1). BLM geologists collected 446 rock chip, stream sediment, pan concentrate, and placer samples while evaluating approximately 51 prospects and mineral occurrences in the district in 2003.

Figure 1. Location of the Delta River Mining District in east-central Alaska. The black polygon in the southern part of the district shows the extent of the BLM's airborne geophysical survey

In this report, the authors present geochemical data that have resulted from the analyses of samples collected in the Delta River Mining District during 2003. Information about the previous work conducted in 2001 and 2002 is presented in BLM Alaska Open-File Report 91 available from the BLM in both hardcopy and a digital PDF format (see <http://juneau.ak.blm.gov>). A full description of the BLM's mineral assessment of the district, with analysis and descriptions of individual properties will be included in the final report on the district.

Table 1 presents data from the evaluation of placer samples the BLM collected during 2003. Don Keill, from the BLM's Northern Field Office in Fairbanks, processed the samples. Part of his processing included separating each sample into magnetic and non-magnetic fractions. Both of the fractions were sent to a commercial laboratory for trace element analysis. Commercial laboratory analytical results for placer, sluice concentrate, pan concentrate, stream sediment, and soil samples are presented in table 2.

Table 3 presents the commercial laboratory's analytical results for rock chip samples. Platinum group element analyses for select rock chip samples are presented in tables 4. Table 5 presents whole rock analyses for select rock chip samples. Coordinates for all samples are presented in table 6.

ACKNOWLEDGMENTS

The authors of this report would like to thank others who participated in field investigations in the Delta River Mining District in 2003. Field assistance was ably provided by Kacey Cole. Joe Kurtak led the investigation of placer deposits in the district. The authors thank Don Keill and Jim Deininger from the BLM's Northern Field Office in Fairbanks for analysis of the placer samples and geologic consultations. Volunteer assistance by geologist Brian Hough was greatly appreciated.

Bill Ellis, of Alaska Earth Sciences, provided invaluable insights into the geology of the area, particularly on the mafic-ultramafic complexes and their platinum group element (PGE) mineral ore potential. The BLM appreciates the expertise shared by other investigators, including Dr. Larry Hulbert of the Geological Survey of Canada.

The authors are also grateful to U.S. Geological Survey (USGS) investigator, Dr. Jeanine Schmidt, who participated in geologic investigations during 2003.

The authors would like to thank the staff of the Tangle River Inn for their gracious hospitality, particularly Nadine and Jack Johnson. Prism Helicopters provided excellent helicopter service.

FIELD SEASON REVIEW

Approximately six BLM geologists and volunteers spent more than five weeks investigating mineral occurrences during July and August 2003. Most of the effort concentrated on the southern part of the district, which hosts Triassic, PGE-bearing, mafic-ultramafic complexes within the Wrangellia terrane. The BLM also investigated other deposit types, including skarn, basaltic copper, vein gold, and placer gold. Geophysical anomalies highlighted by the recently released BLM geophysical survey (Prichard, 2003)¹ were also investigated. Approximately one week was devoted to investigating sites on the north side of the Alaska Range, where rocks known to host volcanogenic massive sulfides (VMS) occur. In all, BLM investigators examined 51 sites and collected 446 samples during the 2003 field season.

In 2002, the BLM contracted for an airborne geophysical survey to be flown in the southwestern part of the Delta River Mining District (fig. 1). The survey, administered by the State of Alaska, Division of Geological and Geophysical Surveys (ADGGS), included the collection of aeromagnetic and resistivity data across approximately 350 square miles. The primary target of the survey was copper-nickel-PGE-bearing mafic and ultramafic rocks. The survey, released to the public in March, 2003, also incorporates approximately 250 square miles of aeromagnetic and resistivity data previously purchased by the BLM. The final product covers about 600 square miles of the southern part of the district. More information about the survey data are available from ADGGS at <http://www.dggs.dnr.state.ak.us/>.

SAMPLING AND ANALYTICAL PROCEDURES

SAMPLING METHODS

BLM personnel collected several types of rock samples during 2003. Channel samples are rock fragments, chips, or dust from a continuous channel of uniform width and depth across an exposure. Chip channel samples are chips of rock taken in a continuous line across a relatively uniform width and depth of an exposure. Continuous chip samples are chips of rock taken in a continuous line across an exposure. Representative chip samples are discontinuous chips of rock taken across an exposure. Spaced chip samples are chips of rock taken at a specified interval across an exposure. Random chip samples are chips of rock taken randomly across an exposure. Grab samples are rock chips or fragments taken more or less at random from an outcrop, float, or mine dump. Select samples are rock chips collected from the highest-grade parts of a mineralized zone.

Stream sediment, soil, and pan concentrate samples are collected in reconnaissance fashion to detect any anomalous metal values that may indicate the presence of mineralized rock in an area. Stream sediment samples are collections of silt- and clay-sized particles taken from a stream bed. Pan concentrate samples consist of one pan full of gravel, sand, and/or fines reduced by standard panning methods. The resultant concentrate of fines, approximately 0.75 ounces, is then analyzed.

BLM personnel collected placer concentrate samples using a portable, hydraulic concentrator, with grizzly, spray bar, and 10- by 48-inch sluice box. Sample sizes generally range from 0.05 to 0.1 bank cubic yard (sediment as measured before digging). The volumes of sampled material are calculated using the criterion of a heaping, 16-inch, gold pan equaling 1/160 of a cubic yard (16 heaping pans equals 0.1 cubic yard). The sample from the sluice box is then panned to produce approximately 2.5 ounces of concentrate.

Sluice concentrate samples are collected mostly from active or recently active placer mines. They consist of one to two pounds of black sands and other heavy minerals remaining after the easily recoverable placer gold has been removed. The amount of gravel washed to produce the concentrate is often unknown. BLM personnel collect these samples to find potentially anomalous accessory elements such as arsenic, antimony, bismuth, or tungsten. Following collection, they are processed like placer samples.

ANALYTICAL METHODS

The BLM contracted ALS Chemex¹ to perform analysis of samples collected in 2003. ALS Chemex meets the BLM requirement that analytical service providers to the BLM be ISO 9002 certified. As part of preparation for analysis rock samples are dried, crushed to a minus 10 mesh, split, and pulverized to a minus 150 mesh. Stream sediment samples are dried and sieved to a minus 80 mesh. Pan concentrate samples are pulverized to a minus 150 mesh. Placer and sluice concentrate samples were geochemically analyzed by a commercial laboratory after manual removal of coarse gold (weights of coarse gold from each sample are presented in table 1). The concentrates were processed by the laboratory like pan concentrate samples.

The laboratory analyzed samples for gold by fire assay pre-concentration of a 30-gram sample followed by an atomic absorption spectroscopy (AA) finish and reported results in parts per billion (ppb).

The laboratory analyzed platinum and palladium by fire assay pre-concentration of a 30-gram sample and an inductively coupled argon plasma –atomic emission spectroscopy (ICP-AES) or inductively coupled argon plasma –mass spectroscopy (ICP-MS) finish. The results are reported in parts per million (ppm).

A subset of the rock chip samples was selected and analyzed for the full suite of PGE elements (Pt, Pd, Ir, Os, Rh, and Ru). The analysis utilizes the fire assay technique with nickel sulfide collection and ICP-MS finish. Results using this method are reported in ppb.

Mercury analysis utilized cold vapor AA methods which typically reports results in ppm.

Whole rock geochemistry of rock samples utilized the XRF analytical technique. Samples are pressed into a 10-gram pellet prior to analysis by X-ray fluorescence spectroscopy (XRF). Elemental oxides and loss-on-ignition (LOI) are reported in percent.

Selected samples were analyzed for sulfur using infrared spectroscopy. Results are reported in percent and are designated using bold type face in table 3.

The remaining elements were analyzed by ICP-AES following partial digestion of approximately 0.5 grams of sample and are reported as either ppm or percent. In most instances, when the results of analyses by this method exceed upper detection limits, the sample is not reanalyzed, however results are typically reported as being greater than the corresponding upper detection limit. Analytical values above ICP-AES detection limits are often obtained for a few selected elements. Over detection limits analyses use low-level assay methods consisting of a multi acid digestion and an AA finish.

¹ Mention of ALS Chemex does not signify BLM endorsement.

ANALYTICAL RESULTS FOR SAMPLES FROM MINES, PROSPECTS, MINERAL OCCURRENCES, AND RECONNAISSANCE INVESTIGATIONS

Analytical and sample data are presented in tables 1 to 6. In addition to the analytical results, the following information may be listed in some of the tables: map number, sample number, sample site, sample type, sampling method, and sample size. The results are organized in the tables by map number, as presented on plate 1.

ABBREVIATIONS

Sample types:

PC	pan concentrate	SL	sluice concentrate
PL	placer	SS	stream sediment
R	rock chip	S	soil

Sampling method (Rock Chip):

CH	channel	Rep	representative chip
C	continuous chip	S	select
G	grab	SC	spaced chip
RC	random chip		

Sample size: Sample sizes are given in feet. The sizes of spaced chip samples (SC) are given by the overall size of the sample followed by the sample spacing (“Int”), e.g., 10 feet @ 0.5-foot spacing.

Sample sites:

FL	float	OC	outcrop
MD	mine dump	RC	rubblecrop
MT	mine tailings	TP	trench, pit, or cut

RESULTS OF PLACER AND SLUICE CONCENTRATE SAMPLE EVALUATION

The following table presents the results of placer and sluice concentrate sample processing by Don Keill, of the BLM's Northern Field Office in Fairbanks. He dried and sieved the samples and removed the coarse gold. He weighed, measured, and described the gold in each sample and examined each with a microscope, noting other conspicuous metals and minerals. He separated each sample into magnetic and non-magnetic fractions. The results of geochemical analysis of the fractions are presented in table 2.

The "Au wt (g)" column presents the weight of gold after separation from each placer concentrate. As much gold as possible was removed manually from the samples. Any gold that was too fine to be removed manually is included in the analytical results from the geochemical analysis of material sent to a commercial laboratory and presented in table 2. No attempt was made to determine the fineness of the gold.

The map numbers in tables correspond to the numbered locations on plate 1.

Abbreviations:

wt	weight	oz	troy ounces
