**Location: Various Locations in Alfalfa, Beaver, Ellis, Roger Mills and
Woods Counties, Oklahoma.**

Finding of No Significant Impact

Based on the analysis of potential environmental impacts contained in the attached Environmental Assessment (EA), I have determined the Proposed Action Alternative is not expected to have significant impacts on the environment. The impacts of leasing the fluid minerals estate in the areas described with this EA have been previously analyzed in the Oklahoma Resource Management Plan (OKRMP), 1994, as amended and the lease stipulations that accompany the tracts proposed for leasing would mitigate the impacts of future development on these tracts. Therefore, preparation of an Environmental Impact Statement (EIS) is not warranted.

**ENVIRONMENTAL ASSESSMENT FOR
January 2013 OIL AND GAS LEASE SALE
DOI-BLM-NM-040-2012-091-EA**

1.0 INTRODUCTION

It is the policy of the Bureau of Land Management (BLM) as derived from various laws, including the Mineral Leasing Act of 1920 (MLA), as amended [30 U.S.C. 181 *et seq.*], and the Federal Land Policy and Management Act of 1976 (FLPMA), as amended, to make mineral resources available for disposal and to manage for multiple resources which include the development of fluid mineral resources to meet national, regional, and local needs.

The BLM New Mexico State Office (NMSO) conducts a quarterly competitive lease sale to sell available oil and gas lease parcels in New Mexico, Oklahoma, Texas, and Kansas. A Notice of Competitive Lease Sale (NCLS), which lists lease parcels to be offered at the auction, is published by the NMSO at least 90 days before the auction is held. Lease stipulations applicable to each parcel are specified in the Sale Notice. The decision as to which public lands and minerals are open for leasing and what leasing stipulations may be necessary, based on information available at the time, is made during the land use planning process. Surface management of non-BLM administered land overlaying federal minerals is determined by the BLM in consultation with the appropriate surface management agency or the private surface owner.

In the process of preparing a lease sale, the NMSO sends a draft parcel list to each field office where the parcels are located. Field Office (FO) staff then review the legal descriptions of the parcels to determine if they are in areas open to leasing; if appropriate stipulations have been included; if new information has become available which might change any analysis conducted during the planning process; if appropriate consultations have been conducted, and if there are special resource conditions of which potential bidders should be made aware. The parcels nominated for this sale, along with the appropriate stipulations from the Oklahoma Resource Management Plan (OKRMP) 1994, as amended, are posted online for a two week public scoping period. Comments received are reviewed and incorporated into the Environmental Assessment (EA).

Once the draft parcel review is completed and returned to the NMSO, a list of available lease parcels and stipulations is made available to the public through a NCLS. On rare occasions, additional information obtained after the publication of

the NCLS may result in deferral of certain parcels prior to the lease sale.

The following EA documents the OFO review of five (5) parcels nominated for the January 2013 Competitive Oil and Gas Lease Sale that are under the administration of the OFO. It serves to verify conformance with the approved land use plan, provides the rationale for deferring or dropping any parcels from a lease sale, as well as providing rationale for attaching any additional lease stipulations to specific parcels.

The parcels and applicable stipulations were posted online for a two week public scoping period starting on July 23, 2012. No comments were received. In addition, this EA was made available for public review and comment for a 30 day period beginning August 27, 2012. No comments were received. .

1.1 Purpose and Need and Decision to be Made

The purpose is to consider opportunities for private individuals or companies to explore for and develop oil and gas resources on public lands through a competitive leasing process.

The need of the action is established by the BLM's responsibility under the MLA, as amended, to promote the exploration and development of oil and gas on the public domain. The MLA also establishes that deposits of oil and gas owned by the United States are subject to disposition in the form and manner provided by the MLA under the rules and regulations prescribed by the Secretary of the Interior, where consistent with the FLPMA, the National Environmental Policy Act (NEPA) of 1969, as amended (Public Law 91-90, 42 USC 4321 *et seq.*), and other applicable laws, regulations, and policies.

The BLM will decide whether or not to lease the nominated parcels and, if so, under what terms and conditions.

1.2 Conformance with Applicable Land Use Plan and Other Environmental Assessments

The applicable land use plan for this action is in the OKRMP and Final Environmental Impact Statement (FEIS), 1994, as amended. The OKRMP (1994), as amended, designated approximately 1.5 million acres of federal minerals open for continued oil and gas development and leasing under Standard Terms and Conditions. The OKRMP (1994), as amended, also describes specific stipulations that would be attached to new leases offered in certain areas. Therefore, it is determined that the alternatives considered conform to fluid mineral leasing decisions in the OKRMP (1994), as amended, and are consistent with the goals and objectives for natural and cultural resources.

Pursuant to 40 Code of Federal Regulations (CFR) 1508.28 and 1502.21, this EA

is tiered to and incorporates by reference the information and analysis contained in the OKRMP (1994), as amended. While it is unknown precisely when, where, or to what extent well sites or roads would be proposed, the analysis of projected surface disturbance impacts, should a lease be developed, is based on potential well densities listed in the Reasonable Foreseeable Development (RFD) Scenario included in the OKRMP (1994), as amended. While an appropriate level of site-specific analysis of individual wells or roads would occur when a lease holder submits an Application for Permit to Drill (APD), assumptions based on the RFD scenario may be used in the analysis of impacts in this EA.

FLPMA established guidelines to provide for the management, protection, development, and enhancement of public lands (Public Law 94-579). Section 103(e) of FLPMA defines public lands as any lands and interest in lands owned by the United States (U.S.). The mineral estate is an interest owned by the U.S., while the BLM has no authority over use of the surface by the surface owner, the BLM is required to declare how the federal mineral estate will be managed in the OKRMP, including identification of all appropriate lease stipulations (43 CFR 3101.1 and 43 CFR 1601.0-7(b); BLM Manual Handbook 1601.09 and 1624-1).

1.3 Federal, State or Local Permits, Licenses or Other Consultation Requirements

Purchasers of oil and gas leases are required to obey all applicable federal, state, and local laws and regulations including obtaining all necessary permits required should lease development occur.

OFO biologists reviewed the Proposed Action and determined it would be in compliance with threatened and endangered species management and consultation guidelines outlined in the Oklahoma Biological Assessment dated March 4, 1993. No further consultation with the U.S. Fish and Wildlife Service (USFWS) is required at this stage for any of the proposed parcels.

Compliance with Section 106 responsibilities of the National Historic Preservation Act (NHPA) are adhered to by following the BLM Manual 8100, 36 CFR Part 800, 43 CFR Part 7, and the Cultural Resources Handbook H-8100-1 (for New Mexico, Oklahoma, Kansas, and Texas). When draft parcel locations are received by the OFO, cultural resource staff reviews the location for any known cultural resources on BLM records.

Tribal Consultations would be completed when specific locations for proposed projects are received, reviewed by the State Historical Preservation Office (SHPO), the Bureau of Indian Affairs (BIA), and specific Tribes. When particular Tribes respond during consultation, that tribe would be directly involved in negotiations with the BLM to determine if the project should be moved, or other mitigation be required.

In Section 1835 of the Energy Policy Act of 2005 (43 U.S.C. 15801), Congress directed the Secretary of the Interior to review current policies and practices with respect to management of federal subsurface oil and gas development activities and their effects on the privately owned surface. The Split Estate Report, submitted in December 2006, documents the findings from consultation on the split estate issue with affected private surface owners, the oil and gas industry, and other interested parties.

BLM NMSO contacts the surface owners and notifies them of the expression of interest and the date the oil and gas rights would be offered for competitive bidding. The BLM would provide the surface owners with its website address so they may obtain additional information related to the oil and gas leasing process, the imposition of any stipulations on that lease parcel, federal and state regulations, and best management practices (BMPs). The surface owners may elect to protest the leasing of the minerals underlying their surface.

If the BLM receives a protest, the parcel would remain on the lease sale; however, the BLM would resolve any protest prior to issuing an oil and gas lease for that parcel. If the protest is upheld, BLM would return the payments received from the successful bidder for that parcel. After the lease sale has occurred, the BLM would post the results on its website and the surface owner may access the website to learn the results of the lease sale.

1.4 Identification of Issues

An internal review of the Proposed Action was conducted by an interdisciplinary team of OFO resource specialists on July 10, 2012, to identify and consider potentially affected resources and associated issues. During the meeting, the interdisciplinary team also identified and subsequently addressed any unresolved issues or conflicts related to the Proposed Action.

The parcels included in the Proposed Action, along with the appropriate stipulations from the RMP, were posted online at http://www.blm.gov/nm/st/en/prog/energy/oil_and_gas/oil_and_gas_lease.html for a two week public scoping period beginning April 23, 2012 through May 7, 2012. No comments were received.

Based on these efforts, the following issues have been determined relevant to the analysis of this action:

Air Quality

- *What effect will the proposed action have on atmospheric pollutants and contaminants?*

Climate

- *What effect will the proposed action have on climate change?*

Cultural Resources

- *What effect will the proposed action have on known and newly discovered artifacts of cultural and archeological significance?*

Floodplains

- *What effect will the proposed action have on floodplains and the integrity of the floodplains?*

Invasive Species

- *What effect will the proposed action have on the spread of non-native species?*

Threatened and Endangered Species

- *What effect will the proposed action have on federally listed and state-listed species that have the potential to be located on the proposed lease tracts?*

Hazard Waste

- *What effect will the proposed action have on the management of fluid mineral drilling and the hazardous wastes produced?*

Water Quality

- *What effect will the proposed action have on water quality in stream systems?*

Wetland and Riparian Areas

- *What effect will the proposed action have on wetland and riparian areas?*

Mineral Resources

- *What effect will the proposed action have on locatable minerals management?*

Watersheds

- *What effect will the proposed action have on watershed?*

Vegetation

- *What effect will the proposed action have on vegetation?*

Special Status Species

- *What effect will the proposed action have on special status species?*

Wildlife

- *What effect will the proposed action have on wildlife and their habitat in general?*

Several issues were considered during project scoping but dismissed from detailed analysis because there would be no potentially significant effects related to the issues resulting from any of the alternatives presented below. The following elements are determined by an interdisciplinary team of resource specialists, following their onsite visit and review of the OKRMP (1994), as amended and other data sources, to not be present:

- Areas of Critical Environmental Concern-None identified.

- Caves and Karsts- None identified.
- Environmental Justice- Not relevant at leasing stage.
- Livestock grazing- No public grazing.
- Native American Religious Concerns- Not applicable at leasing stage.
- Prime or Unique Farmlands- None identified.
- Rights of Way- No oversight by BLM, fee (private or non-federal) surface.
- Recreation- None identified. No oversight by BLM on fee (private or non-federal) surface.
- Public Health- Not relevant at leasing stage.
- Visual Resources- None identified. Not applicable on fee surface.
- Wild and Scenic Rivers- None identified.
- Wilderness or Wilderness Study Areas- None identified.
- Wild Horses and Burros- None present.

2.0 Alternative A - No Action

The BLM NEPA Handbook (H-1790-1) states that for EAs on externally initiated proposed actions, the no action alternative generally means that the proposed action would not take place. In the case of a lease sale, this would mean that an expression of interest to lease (parcel nomination) would be denied or rejected, and the five (5) parcels would not be offered for lease during the January 2013 Competitive Oil and Gas Lease Sale. Surface management and any ongoing oil and gas development on surrounding federal, private, and state leases would continue under current guidelines and practices. Selection of the no action alternative would not preclude these parcels from being nominated and considered in a future lease sale.

2.1 Alternative B - Proposed Action

The Proposed Action is to lease five (5) nominated parcels of federal minerals covering 266.59 acres administered by OFO, for oil and gas exploration and development. The five (5) proposed lease parcels are located in Alfalfa, Beaver, Ellis, Roger Mills and Woods Counties, Oklahoma. Standard terms and conditions as well as stipulations listed in the OKRMP (1994), as amended, would apply. A complete description of these parcels, including any stipulations, is provided in Table 2.1.

A lease notice, WO-ESA-7, would also be attached to each parcel. This notice would notify the lease holder that the BLM reserves discretion to modify, if necessary, any action proposed on the lease to ensure threatened, endangered, or other special status plants or animals, or their habitats would not be adversely affected. Under the Endangered Species Act (ESA) of 1973, as amended, Section 7 Consultation with the USFWS would occur if development is proposed on a lease containing habitat suitable for these special status species.

Once sold, the lease purchaser has the exclusive right to use as much of the

leased lands as is necessary to explore and drill for oil and gas within the lease boundaries, subject to the stipulations attached to the lease (43 CFR 3101).

Oil and gas leases are issued for a 10-year period and continue for as long thereafter as oil or gas is produced in paying quantities. If a lease holder fails to produce oil and gas, does not make annual rental payments, does not comply with the terms and conditions of the lease, or relinquishes the lease, exclusive right to develop the leasehold reverts back to the federal government and the lease can be reoffered in another lease sale.

Drilling of wells on a lease is not permitted until the lease owner or operator secures approval of a drilling permit and a surface use plan as specified under Onshore Oil and Gas Orders listed in Title 43 CFR 3162. A permit to drill would not be authorized until site-specific NEPA analysis is conducted.

Standard terms and conditions, stipulations listed in the RMP as well as stipulations developed through the parcel review and analysis process to address site specific concerns or new information not identified in the land use planning process would apply as appropriate to each lease (as required by Title 43 Code of Federal Regulation 3101.1-3). In addition, site specific mitigation measures and BMPs would be attached as Conditions of Approval (COAs) for each proposed exploration and development activity authorized on a lease.

Parcel numbers, locations, stipulations, and acreages for the Proposed Action Alternative parcels are listed in Table 2-1.

3.0 DESCRIPTION OF AFFECTED ENVIRONMENT

This section describes the environment that would be affected by implementation of the alternatives described in Section 2. Aspects of the affected environment described in this section focus on the relevant resources and issues. Only those elements of the affected environment that have potential to be significantly impacted are described in detail. Generalized descriptions of the Oklahoma environment are contained in Chapter 3 of the OKRMP (1994), as amended, beginning on page 3-1.

3.1 Air Quality

The Environmental Protection Agency (EPA) has the primary responsibility for regulating air quality, including six nationally regulated ambient air pollutants. These criteria pollutants include carbon monoxide (CO), nitrogen dioxide (NO₂), ozone (O₃), particulate matter (PM₁₀ & PM_{2.5}), sulfur dioxide (SO₂) and lead (Pb). Regulation of air quality is delegated to the states and some tribes. Air quality is determined by atmospheric pollutants and chemistry, dispersion meteorology and terrain.

The proposed lease tracts are all located in rural areas of Oklahoma. Air quality in these areas is generally good. None of the proposed lease tracts are located in any of the areas designated by the EPA as “non-attainment areas” for any listed pollutants regulated by the Clean Air Act.

3.2 Climate

Oklahoma is located in a temperate region and experiences occasional extremes of temperature and precipitation typical in a continental climate (University of Oklahoma, 2008). Most of the state lies in an area known as Tornado Alley characterized by frequent interaction between cold and warm air masses producing severe weather. An average 54 tornadoes strike the state per year, one of the highest rates in the world. This is due to Oklahoma’s position between zones of differing prevailing temperature and winds, weather patterns within the state can vary widely between relatively short distances.

The humid subtropical climate (Koppen *Cfa*) of the eastern part of Oklahoma influenced heavily by southerly winds bringing moisture from the Gulf of Mexico, but transitions progressively to a semi-arid zone (Koppen *BSk*) in the high plains of the Panhandle and other western areas from frequently touched by southern moisture. Precipitation and temperatures fall from east to west accordingly, with areas in the southeast averaging an annual temperature of 62 °F (17 °C) and an annual rainfall of 56 inches (1,420 mm), while areas of the panhandle average 58 °F (14 °C), with an annual rainfall under 17 inches (430 mm). All of the state frequently experiences temperatures above 100 °F (38 °C) or below 0 °F (−18 °C), and snowfall ranges from an average of less than 4 inches (10 cm) in

the south to just over 20 inches (51 cm) on the border of Colorado in the pan-handle.

Table 3.3: Summarizes components of climate that could affect air quality in the region.

Climate Component	Temperature
Mean maximum summer temperatures	90.0°F
Mean minimum winter temperatures	32.0°F
Mean annual temperature	62.0°F
Mean annual precipitation	36.0 inches
Mean annual snowfall	12.0 inches
Mean annual wind speed	12.2 mile per hour (mph)

In addition to the air quality information in the current OKRMP, new information about greenhouse gases (GHGs) and their effects on national and global climate conditions has emerged since the OKRMP (1994), as amended, was prepared.

Global mean surface temperatures have increased nearly 1.0°C (1.8°F) from 1890 to 2006 (Goddard Institute for Space Studies, 2007). However, observations and predictive models indicate that average temperature changes are likely to be greater in the Northern Hemisphere. Without additional meteorological monitoring and modeling systems, it is difficult to determine the spatial and temporal variability and change of climatic conditions; what is known is that increasing concentrations of GHGs are likely to accelerate the rate of climate change.

GHGs that are included in the U.S. GHG Inventory are: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF₆). CO₂ and methane (CH₄) are typically emitted from combustion activities or are directly emitted into the atmosphere. On-going scientific research has identified the potential impacts of GHG emissions (including CO₂; CH₄; nitrous oxide (N₂O); and several trace gasses) on global climate. Through complex interactions on regional and global scales, these GHG emissions cause a net warming effect of the atmosphere (which makes surface temperatures suitable for life on Earth), primarily by decreasing the amount of heat energy radiated by the Earth back into space. Although GHG levels have varied for millennia (along with corresponding variations in climatic conditions), recent industrialization and burning of fossil carbon sources have caused CO₂ concentrations to increase dramatically, and are likely to contribute to overall climatic changes. Increasing CO₂ concentrations may also lead to preferential fertilization and growth of specific plant species.

In 2007, the Intergovernmental Panel on Climate Change (IPCC) predicted that by the year 2100, global average surface temperatures would increase 1.4°C to 5.8°C (2.5°F to 10.4°F) above 1990 levels. The National Academy of Sciences

(2006) supports these predictions, but has acknowledged that there are uncertainties regarding how climate change may affect different regions. Computer model predictions indicate that increases in temperature will not be equally distributed, but are likely to be accentuated at higher latitudes. Warming during the winter months is expected to be greater than during the summer, and increases in daily minimum temperatures are more likely than increases in daily maximum temperatures. It is not, however, possible at this time to predict with any certainty the causal connection of site specific emissions from sources to impacts on the global/regional climate relative to the proposed lease parcels and subsequent actions of oil and gas development.

A 2007 US Government Accountability Office (GAO) Report on Climate Change found that, "federal land and water resources are vulnerable to a wide range of effects from climate change, some of which are already occurring. These effects include, among others: 1) physical effects such as droughts, floods, glacial melting, and sea level rise; 2) biological effects, such as increases in insect and disease infestations, shifts in species distribution, and changes in the timing of natural events; and 3) economic and social effects, such as adverse impacts on tourism, infrastructure, fishing, and other resource uses."

A number of activities contribute to the phenomenon of climate change, including emissions of GHGs (especially carbon dioxide and methane) from fossil fuel development, large wildfires, activities using combustion engines, changes to the natural carbon cycle, and changes to radiative forces and reflectivity (albedo). It is important to note that GHGs will have a sustained climatic impact over different temporal scales due to their differences in global warming potential (described above) and life span in the atmosphere.

3.3 Soils

The State's varied climate and topography have combined to produce broad differences in Oklahoma soils. In the eastern part of the state, soils have been developed where leaching is intense and conditions are humid. Western soils developed in an area of lesser rainfall. The potential lease tracts are located in the central to western portion of Oklahoma. Further discussion of soil resources in Oklahoma may be found on pages 3-8 in the OKRMP (1994), as amended.

3.4 Watershed - Hydrology

The nominated Oklahoma lease parcels fall within the following watersheds listed by county; Alfalfa (Lower Salt Fork of Arkansas River), Beaver (North Canadian), Ellis and Roger Mills (South Canadian River) and Woods (Cimarron). Information on watershed-hydrology units can be found on pages 3-19 to 3-24 of the OKRMP (1994), as amended.

3.5 Floodplains

Some or portions of the all nominated lease parcels are potentially located within or adjacent to floodplains.

3.6 Water Quality – Surface/Ground

Information on water quality conditions in Oklahoma can be found on pages 3-5 through 3-7 of the OKRMP (1994), as amended.

3.7 Cultural Resources

Approximately 18,000 archeological sites are recorded in Oklahoma and over 1,000 historic properties in the state are listed on the National Register of Historic Places.

Blanket cultural resource surveys have not been conducted on the proposed lease parcels. Site specific cultural resource surveys and appropriate mitigation measures are required as part of the APD process after the parcels are leased. These will be protected from disturbance by the No Surface Occupancy (NSO) stipulation and surveys.

3.8 Paleontology

All cultural resource surveys for projects in the OFO area of responsibility are required to include statements on any new paleontological material discovered during inventory. These reports are reviewed and new fossil material is reported to paleontologists. Protection and preservation of significant fossil materials in specific locations would be required for any BLM permitted project. These will be protected from disturbance by the No Surface Occupancy (NSO) stipulation and surveys.

3.9 Invasive, Non-native Species

Invasive species are well adapted plants that have been introduced into an area where they do not naturally occur. These new environments do not have the natural constraints adapted to out-compete invasive species thus allowing invader species to out-compete the native plants and damage existing ecosystems. Invasive plants like sericea lespedeza (*Lespedeza cuneata*) and eastern red cedar (*Juniperus virginiana*) severely impact open rangelands and forests, while stream banks and sandy floodplains are being invaded by salt cedar (*Tamarix* spp.). These three plant species are damaging more wildlife habitat and productive landscapes than any other species.

3.10 Vegetation

The nominated lease parcels are located within the Central Great Plains eco-region. Pages 3-8 thru-3-11 of the OKRMP (1994), as amended, provide further details on vegetation resources in the leasing area.

3.11 Threatened or Endangered Species

The purpose of the Endangered Species Act (ESA) is to ensure that federal agencies and departments use their authorities to protect and conserve endangered and threatened species. Section 7 of the Act requires that federal agencies prevent or modify any projects authorized, funded, or carried out by the agencies that are "likely to jeopardize the continued existence of any endangered species or threatened species, or result in the destruction or adverse modification of critical habitat of such species. A thorough list of the species, federally listed as endangered, threatened, or as rare species of special concern, which occur or have potential for occurrence in Alfalfa, Jackson, Kay, Woods counties, Oklahoma where the lease parcels are located, have been identified in Appendix 3.

Oklahoma Department of Wildlife does not list any species of concern for the above listed counties.

3.12 Special Status Species

BLM manages certain sensitive species not federally listed as Endangered (E) or Threatened (T) in Oklahoma. These federal candidate species which receive no special protections under the ESA within Oklahoma are as follows:

- Lesser Prairie Chicken
- Sprague's Pipit
- Neosho Mucket
- Rabbitsfoot
- Arkansas Darter

Under the Endangered Species Act a species may be listed nationwide, throughout its range. There are currently seventeen federally listed T/E species in Oklahoma. The State of Oklahoma has a statute that gives the state the authority to add to the federal list within its own state boundaries. Currently, the state of Oklahoma has four wildlife species listed as state-threatened or state - endangered as follows.

- Long nose darter (E)
- Neosho Mucket (E)
- Oklahoma cave crayfish (E)

- Black-sided darter (T)

3.13 Wildlife

Counties in Oklahoma where the nominated lease parcels occur contain diverse wildlife populations as well as habitats. Generally speaking the eastern one-third of Oklahoma receives ample rainfall and supports much of the oak, pine and hickory forests. The bulk of the central portion of Oklahoma is within the cross timbers area where the transition begins from eastern deciduous forests to the more arid portions of western Oklahoma. The faunal diversity follows this same transition from cypress swamps and alligators in the southeast tip of the state to piñon-juniper and mule deer in the furthest western portion of the Oklahoma panhandle. Regional information on wildlife and their habitats in Oklahoma is contained on pages 3-8 to 3-10 of the OKRMP (1994), as amended.

3.14 Wetlands /Riparian Zones

Executive Order 11990 it is hereby ordered as follows: Section 1. (a) Each agency shall provide leadership and shall take action to minimize the destruction, loss or degradation of wetlands, and to preserve and enhance the natural and beneficial values of wetlands in carrying out the agency's responsibilities for (1) acquiring, managing, and disposing of Federal lands and facilities; and (2) providing Federally undertaken, financed, or assisted construction and improvements; and (3) conducting Federal activities and programs affecting land use, including but not limited to water and related land resources planning, regulating, and licensing activities.

(b) This Order does not apply to the issuance by Federal agencies of permits, licenses, or allocations to private parties for activities involving wetlands on non-Federal property.

All of the nominated lease parcels (refer to Table 2.1) contain, or potentially contain, wetlands and/or riparian zones. Additional information on, and discussion of, wetlands and riparian zones appears on pages 3-8 through 3-10 and 4-6 of the OKRMP (1994), as amended.

3.15 Wastes, Hazardous or Solid

The Resource Conservation and Recovery Act (RCRA) of 1976 established a comprehensive program for managing hazardous wastes from the time they are produced until their disposal. The EPA regulations define solid wastes as any “discarded materials” subject to a number of exclusions. On January 6, 1988, EPA determined that oil and gas exploration, development and production wastes would not be regulated as hazardous wastes under RCRA. The Comprehensive Environmental Response Compensation and Liability Act (CERCLA) of 1980, deals with the release (spillage, leaking, dumping, accumulation, etc.), or threat of a release of hazardous substances into the environment. Despite many oil and gas constituent wastes being exempt from hazardous waste regulations, certain RCRA exempt contaminants could be subject to regulations as hazardous substances under CERCLA.

No hazardous or solid waste materials are known to be present on the proposed lease parcels.

3.16 Mineral Resources

Oil and gas development began in Oklahoma more than 100 years ago and virtually all of the area with high potential for oil and gas production is under prior existing leases held by production.

Mineral resources under the jurisdiction of the OFO are described on pages 3-16-3-21 of the OKRMP (1994), as amended.

4.0 ENVIRONMENTAL CONSEQUENCES AND POTENTIAL MITIGATION MEASURES

4.1 Assumptions for Analysis

The act of leasing parcels would, by itself, have no impact on any resources in the OFO. All impacts would be linked to as yet undetermined future levels of lease development. The environmental consequences of oil and gas leasing in Oklahoma are analyzed in the OKRMP (1994), as amended, (pages 4-1 to 4-29). That analysis, which assumes that the impacts from an average well, pipeline and access road would total 4.25 acres of surface disturbance in Oklahoma is incorporated by reference into this document.

If lease parcels were developed, short-term impacts would be stabilized or mitigated within five years and long-term impacts are those that would substantially remain for more than five years. Potential impacts and mitigation measures are described below.

Cumulative impacts include the combined effect of past projects, specific planned projects and other reasonably foreseeable future actions such as other infield wells being located within these leases. Potential cumulative effects may occur should an oil and gas field be discovered if these parcels are drilled and other infield wells are drilled within these leases or if these leases become part of a new unit. All actions, not just oil and gas development may occur in the area, including foreseeable non-federal actions.

4.2 Effects from the No Action Alternative

Under the No Action Alternative, the proposed parcels would not be leased. There would be no subsequent impacts from oil and/or gas construction, drilling, and production activities. The No Action Alternative would result in the continuation of the current land and resource uses in the proposed lease areas. The No Action Alternative is also used as the baseline for comparison of alternatives.

It is an assumption that the No Action Alternative (no lease option) may result in a slight reduction in domestic production of oil and gas. This would likely result in reduced Federal and state royalty income, and the potential for Federal lands to be drained by wells on adjacent private or state lands. Consumption is driven by a variety of complex interacting factors including energy costs, energy efficiency, availability of other energy sources, economics, demography, and weather or climate. If the BLM were to forego leasing and potential development of those minerals, the assumption is the public's demand for the resource would not be expected to change. Instead, the undeveloped resource would be replaced in the short- and long-term by other sources that may include a combination of imports, using alternative energy sources (e.g. wind, solar), and other domestic production. This displacement of supply would offset any reductions in emissions achieved by not leasing the subject tracts in the short-term.

4.3 Analysis of the Action Alternative

4.3.1 Air Quality Impacts from the Action Alternative

Leasing the subject tracts would have no direct impacts to air quality. Any potential effects to air quality from the sale of lease parcels would occur at such time that the leases were developed. Potential impacts of development could include increased airborne soil particles blown from new well pads or roads, exhaust emissions from drilling equipment, compressors, vehicles, dehydration and separation facilities coupled with volatile organic compounds during drilling or potential activities.

The RFD scenario developed for the OKRMP (1994), as amended, assumed 20 wells would be drilled annually. However, it is unknown whether the petroleum resources specific to these leases in the Proposed Action are oil and gas or a

combination thereof, as well as the actual potential for those resources. In addition, oil wells are on a tighter spacing than gas wells; therefore, the specific number of wells that would be drilled as a result of issuing the leases is unknown. Current APD permitting trends within OFO confirm that these assumptions are still accurate.

Therefore, in order to reasonably quantify emissions associated with well exploration and production activities, certain types of information are needed. Such information includes a combination of activity data such as the types of equipment needed if a well were to be completed successfully (e.g. compressor, separator, dehydrator, etc.). The technologies which may be employed by a given company for drilling any new wells, area of disturbance for each type of activity (e.g. roads, pads, electric lines, compressor station), number of days to complete each kind of construction, number of days for each phase of drilling process, type(s), size, number of heavy equipment used for each type of construction (backhoe, dozer, etc.), number of wells of all types (shallow, deep, exploratory, etc.), compression per well (sales, field booster), or average horsepower for each type of compressor. The degree of impact will also vary according to the characteristics of the geologic formations from which production occurs. Since this type of data is unavailable at this time, including scenarios for oil and gas development, it is unreasonable to quantify emissions. What can be said is that exploration and production would contribute to incremental increases in overall air quality emissions associated with oil and gas exploration and production into the atmosphere.

Mitigation

The BLM encourages industry to incorporate and implement BMPs, which are designed to reduce impacts to air quality by reducing emissions, surface disturbances, and dust from field production and operations. Typical measures include: adherence to BLM's Notice to Lessees' (NTLs) 4(a) concerning the venting and flaring of gas on Federal leases for natural gas emissions that cannot be economically recovered, flare hydrocarbon gases at high temperatures in order to reduce emissions of incomplete combustion; water dirt roads during periods of high use in order to reduce fugitive dust emissions; collocate wells and production facilities to reduce new surface disturbance; implementation of directional drilling and horizontal completion technologies whereby one well provides access to petroleum resources that would normally require the drilling of several vertical wellbores; require that vapor recovery systems be maintained and functional in areas where petroleum liquids are stored; and perform interim reclamation to reclaim areas of the pad not required for production facilities and to reduce the amount of dust from the pads.

4.3.2 Climate

The assessment of GHG emissions, their relationship to global climatic patterns, and the resulting impacts is an ongoing scientific process. It is currently not feasible to know with certainty the net impacts from the proposed action on climate, that is, while BLM actions may contribute to the climate change phenomenon, the specific effects of those actions on global climate are speculative given the current state of the science. The BLM does not have the ability to associate a BLM action's contribution to climate change with impacts in any particular area. The science to be able to do so is not yet available. The inconsistency in results of scientific models used to predict climate change at the global scale coupled with the lack of scientific models designed to predict climate change on regional or local scales, limits the ability to quantify potential future impacts of decisions made at this level and determining the significance of any discrete amount of GHG emissions is beyond the limits of existing science. When further information on the impacts to climate change is known, such information would be incorporated into the BLM's planning and NEPA documents as appropriate.

Leasing the subject tracts would have no direct impacts on climate as a result of GHG emissions. There is an assumption that leasing the parcels would lead to some type of development that would have indirect effects on global climate through GHG emissions; however, those effects on global climate change cannot be determined. (Refer to the cumulative effects section, Chapter 4 for additional information). It is unknown whether the petroleum resources specific to these leases in the Proposed Action are gas or oil or a combination thereof.

Potential impacts of development could include increased airborne soil particles blown from new well pads or roads, exhaust emissions from drilling equipment, compressors, vehicles, and dehydration and separation facilities, as well as potential releases of GHG and volatile organic compounds during drilling or potential activities. The amount of increased emissions cannot be quantified at this time since it is unknown how many wells might be drilled, the types of equipment needed in the case a well were to be completed successfully (compressor, separator, dehydrator, etc.), or what technologies may be employed by the companies drilling any new wells. The degree of impact will also vary according to the characteristics of the geologic formations from which production occurs.

Environmental impacts of GHG emissions from oil and gas consumption are not effects of the proposed action as defined by the Council on Environmental Quality (CEQ), thus are not required to be analyzed under NEPA. Greenhouse gas emissions from consumption of oil and gas are not direct effects under NEPA because they do not occur at the same time and place as the action. They are also not indirect effects because oil and gas leasing and production would not be a proximate cause of greenhouse gas emissions resulting from consumption.

Mitigation

The EPA's inventory data describes "Natural Gas Systems" and "Petroleum Systems" as the two major categories of total U.S. sources of GHG gas emissions. The inventory identifies the contributions of natural gas and petroleum systems to total CO₂ and CH₄ emissions (natural gas and petroleum systems do not produce noteworthy amounts of any of the other GHG). Within the larger category of "Natural Gas Systems", the EPA identifies emissions occurring during distinct stages of operation, including field production, processing, transmission and storage, and distribution. "Petroleum Systems" sub-activities include production field operations, crude oil transportation and crude oil refining. Within the two categories, the BLM has authority to regulate only those field production operations that are related to oil and gas measurement, and prevention of waste (via leaks, spills and unauthorized flaring and venting).

The EPA data shows that improved practices and technology, and changing economics have reduced emissions from oil and gas exploration and development (Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2006). One of the factors in this improvement is the adoption, by industry of the BMPs proposed by the EPA's Natural Gas Energy Star program. The OFO will work with industry to facilitate the use of the relevant BMP's for operations proposed on federal mineral leases where such mitigation is consistent with agency policy.

4.3.3 Soils

While the act of leasing a tract would produce no impacts, subsequent development of the lease would physically disturb the topsoil and would expose the substratum soil on subsequent project areas. Direct impacts resulting from the oil and gas construction of well pads, access roads, and reserve pits include removal of vegetation, exposure of the soil, mixing of horizons, compaction, loss of top soil productivity and susceptibility to wind and water erosion. Wind erosion would be expected to be a minor contributor to soil erosion with the possible exception of dust from vehicle traffic. These impacts could result in increased indirect impacts such as runoff, erosion and off-site sedimentation. Activities that could cause these types of indirect impacts include construction and operation of well sites, access roads, gas pipelines and facilities.

Contamination of soil from drilling and production wastes mixed into soil or spilled on the soil surfaces could cause a long-term reduction in site productivity. Some of these direct impacts can be reduced or avoided through proper design, construction and maintenance and implementation of BMPs.

Additional soil impacts associated with lease development would occur when heavy precipitation causes water erosion damage. When water saturated

segment(s) on the access road become impassable, vehicles may still be driven over the road. Consequently, deep tire ruts would develop. Where impassable segments are created from deep rutting, unauthorized driving may occur outside the designated route of access roads.

Mitigation

The operator would stockpile the topsoil from the surface of well pads which would be used for surface reclamation of the well pads. The impact to the soil would be remedied upon reclamation of well pads when the stockpiled soil that was specifically conserved to establish a seed bed is spread over well pads and vegetation re-establishes.

Reserve pits would be re-contoured and reseeded as described in Conditions of Approval attached to the APD. Upon abandonment of wells and/or when access roads are no longer in service the Authorized Officer (AO) would issue instructions and/or orders for surface reclamation/restoration of the disturbed areas as described in attached Conditions of Approval (COAs).

Road construction requirements and regular maintenance would alleviate potential impacts to access roads from water erosion damage.

4.3.4 Watershed Protection

As with soils, the amount and location of direct and indirect effects cannot be predicted until the site-specific APD stage of development. If wells are drilled as a result of the proposed leases, site construction (pad, pipeline and road) would remove vegetation and compact an estimated 4.25 acres in Oklahoma. This would increase the potential for sheet erosion and could decrease the permeability of compacted areas.

Mitigation

BMPs would be incorporated into Special COAs attached to a permit to drill. These typically include: Six inches of top soil from the proposed location shall be stock piled and be available for reshaping during the restoration process. No cut and/or fill shall take place outside of the staked surveyed area. Stockpiled soil shall be protected from wind and water erosion through prompt establishment and maintenance of an effective, quick growing vegetative cover.

4.3.5 Floodplains

The act of leasing federal minerals produces no impacts to floodplains; however, the subsequent development may produce impacts in the form of surface disturbance. Surface disturbance from the development of well pads, access roads, pipelines, and power lines can result in impairment of the floodplain values from removal of vegetation, removal of wildlife habitat, impairment of water

quality, decreased flood water retention and decreased groundwater recharge.

Protective stipulation ORA-1 would be attached to any lease of a tract which falls within a floodplain. ORA-1 states that, "All or portions of the lands under this lease lie in and or adjacent to a major watercourse and are subject to periodic flooding. Surface occupancy of these areas will not be allowed without the specific approval, in writing, of the BLM." This stipulation would be attached to portions of parcels listed in Table 2-1 for the purpose of protecting streams, rivers and floodplains, and specify that surface disturbance would not be allowed within up to 200 meters of the outer edge of 100-year floodplains to protect the integrity of those floodplains.

Mitigation

Potential mitigation is deferred to site-specific development at APD stage.

4.3.6 Water Quality: Surface and Groundwater

While the act of leasing a parcel would produce no impacts, subsequent development of the lease would lead to surface disturbance from the construction of well pads, access roads, pipelines, and power lines which can result in degradation of surface water quality and groundwater quality from non-point source pollution, increased soil losses, and increased gully erosion.

Potential direct impacts that would occur due to construction of well pads, access roads, pipelines, and power lines include increased surface water runoff and off-site sedimentation brought about by soil disturbance; increased salt loading and water quality impairment of surface waters; channel morphology changes due to road and pipeline crossings; and possible contamination of surface waters by produced water. The magnitude of these impacts to water resources would depend on the proximity of the disturbance to the drainage channel, slope aspect and gradient, degree and area of soil disturbance, soil character, duration and time within which construction activity would occur, and the timely implementation and success or failure of mitigation measures.

Direct impacts would likely be greatest shortly after the start of construction activities and would likely decrease in time due to natural stabilization, and reclamation efforts. Construction activities would occur over a relatively short period; therefore, the majority of the disturbance would be intense but short lived. Direct impacts to surface water quality would be minor, short-term impacts which may occur during storm flow events. Indirect impacts to water-quality related resources, such as fisheries, would not occur.

Petroleum products and other chemicals, accidentally spilled, could result in surface and groundwater contamination. Similarly, possible leaks from reserve and evaporation pits could degrade surface and ground water quality.

Authorization of the proposed projects would require full compliance with BLM directives and stipulations that relate to surface and groundwater protection.

Mitigation

The use of a plastic-lined reserve pits would reduce or eliminate seepage of drilling fluid into the soil and eventually reaching groundwater. Spills or produced fluids (e.g., saltwater, oil, and/or condensate in the event of a breach, overflow, or spill from storage tanks) could result in contamination of the soils onsite, or offsite, and may potentially impact surface and groundwater resources in the long term. The casing and cementing requirements imposed on proposed wells would reduce or eliminate the potential for groundwater contamination from drilling mud and other surface sources.

4.3.7 Cultural Resources

While the act of leasing federal minerals would produce no direct impacts to cultural resources, subsequent development of a lease may produce impacts. Direct and indirect effects cannot be predicted without analysis of site-specific development proposals. These proposals would occur at the APD stage of development. Potential impacts at that stage could include increased human activity and possibility of removal of, or damage to, heritage artifacts. The increase in human activity in the area increases the possibility of irretrievable loss of information pertaining to the heritage of the project region. Conversely, the benefits to heritage resources derived from the future development are the heritage and historic survey that adds to literature, information, and knowledge of cultural resources.

Mitigation

Specific mitigation measures, including, but not limited to, possible site avoidance or excavation and data recording would have to be determined when site-specific development proposals are received.

4.3.8 Paleontology

Direct and indirect effects cannot be predicted without analysis of site-specific development proposals. These proposals would occur at the APD stage of development. Potential impacts at that stage could include increased human activity and possibility of removal of, or damage to, paleontology resources. The increase in human activity in the area increases the possibility of irretrievable loss of information pertaining to the paleontology of the project region. Conversely, a benefit to paleontology resources could occur if potential future development results in a paleontology survey that adds to literature, information, and knowledge of paleontology resources.

Mitigation

Specific mitigation measures, including, but not limited to, possible site avoidance or excavation and data recording would have to be determined when site-specific development proposals are received.

4.3.9 Invasive, Non-native Species

While the act of leasing Federal minerals would produce no direct impacts to invasive or non-native species, subsequent development of a lease may produce impacts. Any surface disturbance can increase the possibility of establishment of new populations of invasive non-native species. The likelihood of this happening cannot be predicted with existing information. At the APD stage, OFO requirements for use of weed control strategies would minimize the potential for spread of these species.

Mitigation

Mitigation is deferred to site-specific development at APD stage. BMPs require that all actions on public lands that involve surface disturbance or rehabilitation, reasonable steps are required to prevent the introduction or spread of noxious weeds, including requirements for using weed seed-free hay, mulch and straw.

4.3.10 Vegetation

Leasing would have no direct affect on vegetation or forestry. If oil and/or gas development occurs as a result of leasing, site clearing would remove an estimated 4.25 acres of vegetation for the use of a drill pad, access road and pipeline construction for each well drilled.

Mitigation

If potential wells are productive disturbed areas not needed for the production facility would be reclaimed resulting in approximately 2 acres impacted for the life of each well. In the case of non-productive wells, all disturbed areas should be reseeded and vegetative cover reestablished. Vegetation would be established on all areas of the location to be reclaimed. This phase of the reclamation process should be accomplished by using seed or sod. Current policy recommends that these areas be restored with native vegetation in regards to both species and structure. This recommended reclamation is contingent upon the wishes of the surface owner.

4.3.11 Threatened or Endangered Species

Leasing the tracts would have no direct impacts to T/E species. If the lease results in development, a site-specific biological resource surveys would be required at the project stage and, depending on location and nature of the proposed development and the results of surveys, additional Section 7 consultation could be required.

Furthermore, the lease notice (WO-ESA-7) would be attached to any leases in counties containing suitable habitat for T/E species. If any surface disturbing actions are proposed as a result of this proposed lease, a biological evaluation shall be conducted and site-specific mitigating measures would be developed.

Mitigation

Mitigation is deferred to site-specific development at APD stage. BMPs would be required if any T/E species are found.

4.3.12 Special Status Species

No direct or indirect effects are expected based on existing information. Further site-specific inventories would be conducted, if necessary, at the project (APD) stage to determine if additional analysis would be required.

Mitigation

Potential mitigation is deferred to the site-specific APD stage of development.

4.3.13 Wildlife

Leasing the tracts would have no direct impacts to wildlife. If the lease results in development, a site specific assessment will be performed at that time.

Mitigation

Wildlife impacts are deferred to the site-specific APD stage of development.

4.3.14 Wetlands/Riparian Zones

Some of the nominated lease parcels contain wetlands or potential wetlands. Leasing the proposed tracts would result in no direct impacts to wetlands. Potential indirect results may occur if wells incorporating these federal minerals are drilled as a result of this lease.

Protective stipulation ORA-2, "Wetland/Riparian Protection" and ORA-1 "Floodplain Protection" would be attached to the leases since they contain

wetlands and or riparian zones.

ORA-2 states; “All or portions of the lands under this lease contain wetlands and or riparian zones. Surface occupancy of these areas will not be allowed without the specific approval, in writing, of the BLM. Impacts or disturbance to wetlands and riparian habitats which occur on this lease must be avoided or mitigated. The mitigation shall be developed during the application to drill process.”

ORA-1 states; “A result of EO 11988 Floodplain Management of May 24, 1977, All or portions of the lands under this lease lie in and or adjacent to a major watercourse and are subject periodic flooding. Surface occupancy of these areas will not be allowed without the specific approval, in writing, of the Bureau of Land Management”.

Mitigation

Potential mitigation is deferred to site-specific development at APD stage.

4.3.15 Wastes, Hazardous or Solid

Leasing the subject tracts would have no direct effect on hazardous or solid wastes. The proposed lease could result in a project that has the potential for either short or long-term impacts to all resources to some manner or degree, by pollution from un-managed hazardous and non-hazardous waste streams.

Mitigation

None required at the lease stage. If development results site specific measures are developed and attached to the permit to drill. Special conditions typically include:

- 1) All identified fresh water zones will be isolated by using casing and cementing procedures (USGS base of treatable fresh water isopach maps).
- 2) All wastes from all waste streams on site must be removed to an approved disposal site. No land disposal of any wastes on site will be permitted.

4.3.16 Mineral Resources

If the proposed leases result in wells those wells have the potential to affect production horizons and reservoir pressures. If the wells are producers the resources allotted to these wells will eventually be depleted. The amount and location of direct and indirect effects cannot be predicted until the site-specific APD stage of development. None of the lease parcels appear to present any conflict with the development of other mineral resources such as coal or sand and gravel.

Mitigation

Potential mitigation is deferred to the site-specific APD stage of development. Spacing orders and allowable production orders are designed to conserve the oil and/or gas resource and provide maximum recovery.

4.4 Cumulative Effects

Analysis of cumulative impacts for reasonably foreseeable development of oil and gas wells on Oklahoma lands was presented in the OKRMP (1994), as amended, (pages 4-1 to 4-5). Potential development of all available federal minerals in Oklahoma including those in the proposed lease parcels was included as part of the analysis. Total surface disturbance projected by the plans was based on an estimated 20 federal wells being drilled annually in Oklahoma. The estimated 20 federal wells in Oklahoma were projected to disturb approximately 85 acres. Over the last 10 years there have been no changes to the basic assumptions or projections described in the OKRMP analysis.

More than 100 years of oil and gas development in Oklahoma have resulted in an extensive infrastructure of existing roads and pipelines. The extent of this development is illustrated by the following statistics. Oklahoma Corporation Commission records show that 432,868 wells have been drilled in Oklahoma from 1904 to 2006. Impacts from this development will remain on the landscape until final abandonment and reclamation of facilities occurs as wells are plugged when they are no longer economically viable.

The NMSO manages approximately 41 million acres of Federal mineral estate. Of the 41 million acres, 35 million acres are available for oil and gas leasing. Approximately 17% of the 35 million acres is currently leased (73% of the leases are in production and 63% of the lease acres are in production). The NMSO received 128 parcel nominations (65,370.44 acres) for consideration in the January 2013 Oil & Gas Lease Sale, and is proposing to lease 82 (42,917.96 acres) of the 128 parcels. If these 82 parcels were leased, the percentage of Federal minerals leased would not significantly change. The Farmington, Carlsbad, Roswell, and Taos parcels are analyzed under separate EAs.

Table 5A. Actual - Acres of Federal Minerals/Acres Available/Acres Leased:

State	Federal O&G Mineral Ownership	Acres Available	Acres Leased	Percent Leased
KS	744,000	596,147	129,378	22%
NM	34,774,457	30,699,038	5,140,073	17%
OK	1,998,932	1,810,000	329,765	18%
TX	3,404,298	1,774,545	450,425	25%
Totals/Average	40,921,687	34,879,730	6,049,641	17%

Table 5B. Parcels Nominated & Offered in the January 2013 Oil & Gas Lease Sale:

Field Office	No. of Nominated Parcels	Acres of Nominated Parcels	No. of Parcels to be Offered	Acres of Parcels to be Offered
Carlsbad	19	6,256.84	9	1,559.85
Roswell	1	640.00	1	640.00
Farmington	39	19,643.46	4	1,918.92
Taos	16	13,330.1	15	13,299.15
Texas	49	25,233.45	29	25,233.45
Oklahoma	5	266.59	5	266.59
Totals	128	65,370.44	82	42,917.96

Table 5C. Foreseeable - Acres of Federal Minerals/Acres Available/Acres Leased:

State	Federal O&G Mineral Ownership	Acres Available	Acres Leased	Percent Leased
KS	744,000	596,147	129,378	22%
NM	34,774,457	30,699,038	5,167,360	17%
OK	1,998,932	1,810,000	331,071	18%
TX	3,404,298	1,774,545	483,260	27%
Totals/Average	40,921,687	34,879,730	6,111,069	18%

Analysis of cumulative impacts for reasonably foreseeable development of oil and gas wells on Oklahoma lands was presented in the OKRMP (1994), as amended, (pages 4-1 to 4-5). Potential development of all available federal minerals in Oklahoma including those in the proposed lease parcels was included as part of the analysis. Total surface disturbance projected by the plans was based on an estimated 20 federal wells being drilled annually in Oklahoma. The estimated 20 federal wells in Oklahoma were projected to disturb approximately 85 acres. Over the last 10 years there have been no changes to the basic assumptions or projections described in the OKRMP analysis.

More than 100 years of oil and gas development in Oklahoma have resulted in an extensive infrastructure of existing roads and pipelines. The extent of this development is illustrated by the following statistics. Oklahoma Corporation Commission records show that 432,868 wells have been drilled in Oklahoma from 1904 to 2006. Impacts from this development will remain on the landscape until final abandonment and reclamation of facilities occurs as wells are plugged when they are no longer economically viable.

4.4.1 Climate Change

The EPA's Inventory of US Greenhouse Gas Emissions and Sinks found that in 2009, total U.S. GHG emissions were almost 7 billion (6,639.7 million) metric

tons and that total U.S. GHG emissions have increased by 7.4% from 1990 to 2009 (EPA, 2011). Emissions declined from 2008 to 2009 by 6.0% (422.2 million metric tons CO₂^e). The primary causes of this decrease were the reduced energy consumption during the economic downturn and increased use of natural gas relative to coal for electricity generation (EPA, 2011).

On-going scientific research has identified the potential effects of anthropogenic GHG emissions such as carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O) and several trace gasses; changes in biological carbon sequestration; and other changes due to land management activities on global climate. Through complex interactions on a global scale, GHG emissions cause a net warming effect of the atmosphere, primarily by decreasing the amount of heat energy radiated by the earth back into space. Although natural GHG atmospheric concentration levels have varied for millennia (along with corresponding variations in climatic conditions), industrialization and burning of fossil carbon sources have caused GHG concentrations to increase.

Analysis of cumulative impacts for RFD of oil and gas wells on lands in the OFO was presented in the OKRMP (1994), as amended. Potential development of all available federal minerals in the field office, including those in the proposed lease parcels, was included as part of the analysis.

This incremental contribution to global GHG gases cannot be translated into effects on climate change globally or in the area of this site-specific action. As oil and gas production technology continues to improve, and because of the potential development of future regulation or legislation, one assumption is that reductions in the rate or total quantity of GHG emissions associated with oil and gas production are likely. As stated in the direct/indirect effects section under climate change, the assessment of GHG emissions and the resulting impacts on climate is an ongoing scientific process. It is currently not feasible to know with certainty the net impacts from the proposed action on global or regional climate, that is, while BLM actions may contribute to the climate change phenomenon, the specific effects of those actions on global climate are speculative given the current state of the science. Therefore, the BLM does not have the ability to associate an action's contribution in a localized area to impacts on global climate change. Further, an IPCC assessment states that difficulties remain in attributing observed temperature changes at smaller than continental scales. It is currently beyond the scope of existing science to predict climate change on regional or local scales resulting from specific sources of GHG emissions.

Currently, global climate models are inadequate to forecast local or regional effects on resources (IPCC, 2007; CCSP, 2008). However, there are general projections regarding potential impacts to natural resources and plant and animal species that may be attributed to climate change from GHG emissions over time; however these effects are likely to be varied, including those in the southwestern United States (Karl et al., 2009). For example, if global climate change results in a warmer and drier climate, increased particulate matter impacts could occur due

to increased windblown dust from drier and less stable soils. Cool season plant species' spatial ranges are predicted to move north and to higher elevations, and extinction of endemic threatened/endangered plants may be accelerated. Due to loss of habitat or competition from other species whose ranges may shift northward, the population of some animal species may be reduced or increased. Less snow at lower elevations would likely impact the timing and quantity of snowmelt, which, in turn, could impact water resources and species dependant on historic water conditions (Karl et al., 2009).

The absence of a regulatory requirement to measure GHG emissions and the variability of oil and gas activities on federal minerals in Oklahoma prevent accurate quantification of GHG emissions that might occur as a result of making the proposed tracts available for leasing. We can however make some generalizations: leasing the proposed tracts may contribute to ongoing drilling of an average of 20 wells a year on federal leases in the states of Oklahoma. A total of 2,427 wells were drilled in Oklahoma in 2006. This total, when compared to the estimates used for the cumulative analysis previously referenced, shows that wells drilled on federal leases wells may be expected to produce approximately 0.002 % of the GHG emissions produced from wells drilled in Oklahoma. The amount of GHG emissions are small, incremental contributions to the total emissions from the three state area, and are also insignificant when compared to global GHG emission levels. These small incremental contributions to global GHG gases cannot be translated into incremental effects on climate change globally or in the area of this site-specific action (43 CFR 1508.27a). The total amount of GHG emissions from oil and gas activities is expected to continue decreasing as improved technology and changing economics result in more complete control of GHG emissions at all stages of oil and natural gas systems.

5.0 CONSULTATION/COORDINATION

This section includes the resource specialists located within the OFO that specifically participated and provided input in the lease parcel review process and the development of this EA document.

On 31 May 2012 a briefing for the BLM NM State Director was held at the New Mexico State Office to review Field Office recommendations for nominated parcels.

5.1 Public Involvement

The parcels nominated for this sale, along with the appropriate stipulations from the OKRMP (1994), as amended, were posted online for a two week review period beginning July 23, 2012. No comments were received. This EA was made available for public review and comment for 30 days starting August 27, 2012. No comments were received.

RE: Biological Evaluation for January 13, 2013 Federal Oil & Gas Lease Sale (DOI-BLM-NM-040-2012-091). NM-201301-074, Sec. 6 T30N-R21E Beaver County, NM-201301-075, Sec. 18-T17N-R10W Alfalfa County, NM-201301-076, Sec. 09-T27N-R15W Woods County, NM-201301-077, Sec. 31-T17N-R24W Roger Mills County, and NM-201301-078, Sec. 32-T17N-R1W Ellis County, Oklahoma.

The Bureau of Land Management's (BLM) environmental assessment (EA) for this project contains all pertinent information regarding the specific characteristics of the proposed leasing of federal oil & gas minerals. The purpose of this report is to document BLM's "No Effect" for threatened & endangered species based on the administrative action on making the proposed parcels available for leasing.

Threatened and Endangered Species

The purpose of the Endangered Species Act (ESA) is to ensure that Federal Agencies and Departments use their authorities to protect and conserve endangered and threatened species.

Section 7 of the Act requires that federal agencies prevent or modify any projects authorized, funded, or carried out by the agencies that are "likely to jeopardize the continued existence of any endangered species or threatened species, or result in the destruction or adverse modification of critical habitat of such species."

The table below provides a list of Federal listed endangered, threatened, and rare species of special concern, which occur or have potential for occurrence in this January 13, 2013 lease sale.

Federally Listed Threatened and Endangered Species and Species of Concern for Beaver, Alfalfa, Woods, Roger Mills, and Ellis Counties, Oklahoma			
Scientific Name	Common Name	Federal Status	County
Birds			
<i>Charadrius melodus</i>	Piping plover	Threatened	Beaver/Alfalfa/Woods/Ellis/Roger Mills
<i>Sterna antillarum</i>	Least tern	Endangered	Beaver/Alfalfa/Woods/Ellis/Roger Mills
<i>Grus americana</i>	Whooping crane	Endangered	Beaver/Alfalfa/Woods/Ellis/Roger Mills
<i>Tympanuchus</i>	Lesser prairie chicken	Candidate	Beaver/Alfalfa/Woods/Ellis/Roger

Federally Listed Threatened and Endangered Species and Species of Concern for Beaver, Alfalfa, Woods, Roger Mills, and Ellis Counties, Oklahoma			
Scientific Name	Common Name	Federal Status	County
<i>pallidicinctus</i>			Mills
<i>Notropis girardi</i>	Arkansas River shiner/critical habitat	Threatened	Beaver/Woods/Ellis/Roger Mills
<i>Etheostoma cragini</i>	Arkansas Darter	Candidate	Beaver

Piping Plovers

Habitat: Piping Plovers are found on mudflats, sandy beaches and shallow wetlands with sparse vegetation. They may be found along the margins of lakes and large rivers where there is exposed (bare) sand or mud.

Current Distribution: There are two nesting records for the Piping Plover in the Oklahoma panhandle, but this species is normally a spring and fall migrant throughout the state. Most records for migrating Piping Plovers occur across the main body of the state; recent records have come from Woodward, Alfalfa, Oklahoma, Cleveland, Tulsa and Washington counties. Spring migration occurs in April and early May; fall migration occurs between the last week of July and late September.

Interior Least Tern

Habitat: Terns live along large rivers and may sometimes be found hunting fish in shallow wetlands and the margins of ponds and lakes. Least Terns require bare sand and gravel for nesting and typically nest in small colonies consisting of two to 20 pairs along large rivers on sand bars and scoured bends. Colonies also occur on salt flats such as the large one at Salt Plains National Wildlife Refuge.

Current Distribution: The Least Tern is a rare species and is found in Oklahoma during the late spring and summer breeding season (mid-May through late August). In Oklahoma, Least Terns may be found on portions of the Arkansas, Cimarron, Canadian and Red rivers.

Whooping Crane

Habitat: Whooping Cranes pass through Oklahoma each spring and fall during migration. While in our state, they are typically found in shallow wetlands, marshes, the margins of ponds and lakes, sandbars and shorelines of shallow rivers, wet prairies and crop fields near wetlands.

Current Distribution: During their migration, they pass through the western half of Oklahoma – most sightings occur west of Interstate 35 and east of Guymon in the panhandle. Currently, the migratory population consists of approximately 270 birds that nest in northern Canada and winter along the Gulf Coast of Texas.

Lesser Prairie-Chicken (LPC)

Habitat: The sand shinnery and sand sagebrush native rangelands of northwest Oklahoma are crucial for survival of this species.

Current Distribution: LPC are found in southeastern Colorado, southwestern Kansas, northwestern Oklahoma, Eastern New Mexico, and the Texas Panhandle. The lesser prairie chicken is identified as a species of greatest conservation need in Oklahoma and is a candidate for federal listing as threatened, range-wide.

Arkansas River Shiner (ARS)

Habitat: Historically, ARS inhabit the main channels of wide, shallow, sand-bottomed rivers and larger streams of the Arkansas River basin. Adults are uncommon in quiet pools or backwaters, and almost never occur in tributaries having deep water and bottoms of mud or stone. Juvenile ARS are associated most strongly with current, conductivity (total dissolved solids), and backwater and island habitat types.

Current Distribution: The ARS is known to occur in the Arkansas River basin throughout northeastern New Mexico, southwestern Kansas, the Texas panhandle, and northwestern/central and eastern Oklahoma, with a small isolated population in south central Arkansas.

Arkansas Darter (AD)

Habitat: The AD prefers shallow, clear, cool water, sand or silt bottom streams with spring-fed pools and abundant rooted aquatic vegetation. During late summer low-water periods when streams may become intermittent, AD populations can persist in large, deep pools. Arkansas darters feed on a variety of aquatic insects, primarily mayflies, and some plant material, including small seeds.

Current Distribution: The AD is a small, 2.5 inch fish in the perch family native to portions of the Arkansas River basin. The AD's range includes sites in extreme northwestern Arkansas, southwestern Missouri, and northeastern Oklahoma, within the Neosho River watershed. It also occurs in a number of watersheds and isolated streams in eastern Colorado, south-central and southwestern Kansas, and the Cimarron watershed in northwest Oklahoma. In Oklahoma, the AD is found only in Beaver and Harper counties.

All or portions of these leases could contain Federal and/or state listed threatened or endangered species or/and their habitats. Any proposed surface disturbing activity may require an inventory and consultation with the Service and/or the state wildlife agency. The consultation could take up to 180 days to complete. Surface occupancy could be restricted or not allowed as a result of the consultation. Appropriate modifications to the imposed restrictions will be made for the maintenance and operations of producing oil and gas wells.

Ecoregion

The Central Great Plains is slightly lower and receives more precipitation and irregularly compared to the Western High Plains. Once covered in grassland with scattered low trees and shrubs in the south, much of this ecological region is now cropland. The eastern boundary of the region marks the eastern limits of the major winter wheat growing area in the United States.

Wetland and Riparian Habitat

Wetland habitats provide important wintering and migrational habitat for Central Flyway Birds. Wetlands also provide a link between land and water and are some of the most productive ecosystems in the world. Two executive orders, both issued in 1977 under the Carter Administration, pertain to consultation and avoidance of wetland impacts. Executive Order (EO) 11990 on the Protection of Wetlands provides opportunity for early review of Federal agency plans regarding new construction in wetland areas. It also urges all Federal agencies to avoid supporting, assisting, or financing new construction in wetlands unless there is "no practicable alternative." EO 11988: Floodplain Management - an order given by President Carter in 1977 to avoid the adverse impacts associated with the occupancy and modification of floodplains. The Service National Wetlands Inventory Mapper shows that there are wetland and riparian habitat associated with all of these lease sale parcels.

Migratory Birds

Executive Order (EO) 13186, 66 Fed. Reg. 3853, (January 17, 2001) identifies the responsibility of federal agencies to protect migratory birds and their habitats, and directs executive departments and agencies to undertake actions that will further implement the Migratory Bird Treaty Act (MBTA). Under the MBTA, incidental, unintentional, and accidental take, killing, or possession of a migratory bird or its parts, nests, eggs or products, manufactured or not, without a permit is unlawful. EO 13186 includes a directive for federal agencies to develop a memorandum of understanding (MOU) with the Service to promote the conservation of migratory bird populations, including their habitats, when their actions have, or are likely to have, a measurable negative effect on migratory bird populations. Whereas the MBTA only protects migratory birds, EO 13186 provides for the protection of both migratory birds and migratory bird habitat.

All of the five Oklahoma lease sale parcels (NM-2013-074, NM-2013-075, NM-2013-076, NM-2013-077, and NM-2013-078), are located within Bird Conservation Region 19, Central Mixed-Grass Prairie. Twenty-seven birds of conservation concern have been identified in this region. Therefore, per the MOU between BLM and the Service, entitled "To Promote the Conservation of Migratory Birds," the following temporal and spatial conservation measures must be implemented as part of the Conditions of Approval with a permit to drill:

- 1) Avoid any take of migratory birds and/or minimize the loss, destruction, or degradation of migratory bird habitat while completing the proposed project or action.
- 2) If the proposed project or action includes a reasonable likelihood that take of migratory birds will occur, then complete actions that could take migratory birds outside of their nesting season.

- 3) If no migratory birds are found nesting in proposed project or action areas immediately prior to the time when construction and associated activities are to occur, then the project activity may proceed as planned.

Additionally, the proposed lease sale parcels and all subsequent activities resulting from it are subject to all state and federal regulations and proposed lease stipulations designed to reduce environmental risks. Lease stipulations are legally binding restrictions and operating requirements that become part of lease contracts. Following are additional stipulations that are required of the six individual parcels, if permitted:

NM-2013-074 Beaver County, Oklahoma parcel will have stipulation WO-ESA-7: Threatened and Endangered Species protection, ORA-2: Wetland/Riparian Protection, and ORA-3: Season of Use Stipulation (for LPC).

NM-2013-075 Alfalfa County, Oklahoma parcel will have stipulation WO-ESA-7: Threatened and Endangered Species protection and ORA-2: Wetland/Riparian Protection.

NM-2013-076 Woods County, Oklahoma parcel will have stipulation WO-ESA-7: Threatened and Endangered Species protection.

NM-2013-077 Roger Mills County, Oklahoma parcel will have stipulation WO-ESA-7: Threatened and Endangered Species protection, ORA-2: Wetland/Riparian Protection, and ORA-3: Season of Use Stipulation (for LPC).

NM-2013-078 Ellis County, Oklahoma parcel will have stipulation WO-ESA-7: Threatened and Endangered Species protection, ORA-2: Wetland/Riparian Protection, and ORA-3: Season of Use Stipulation (for LPC).

This lease sale, in and of itself, has no impact on threatened or endangered species, wetland or migratory birds to analyze or consult on. Additionally, site-specific analysis and mitigation will occur once the parcels are leased and an Application for Permit to Drill is submitted.

Based on all the information discussed above the biological determination of effect for federally listed species regarding leasing of these parcels is “**NO EFFECT**”.
