

# National Petroleum Reserve in Alaska (NPR-A) Weekly Weather and Tundra Travel Report

Bureau of Land Management Alaska, Arctic District Office

Data pulled week of March 15, 2024.

## BACKGROUND

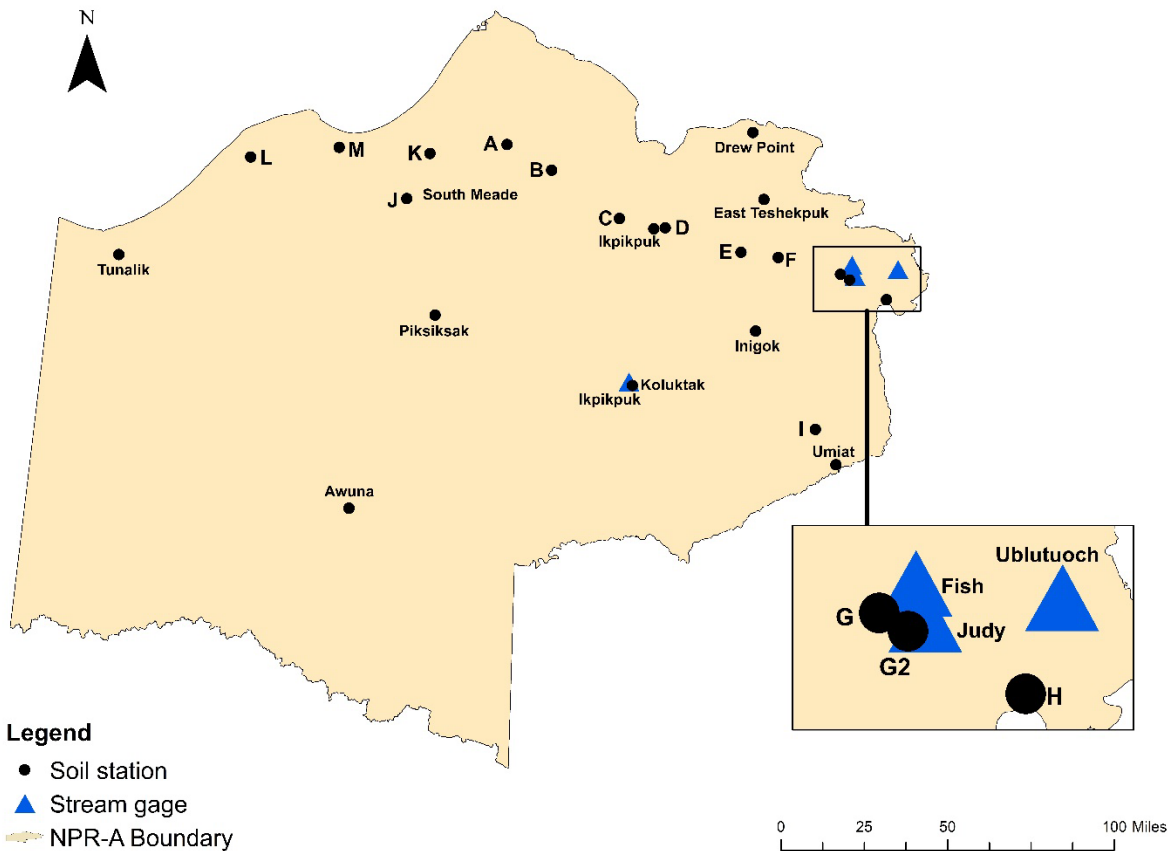

The Bureau of Land Management (BLM) permits snow trail construction in the NPR-A for use by industry and residents in local communities. Along with the U.S. Geological Survey (USGS), BLM Alaska maintains remote monitoring stations to track tundra conditions year-round. BLM shares the data leading up to permitted snow trail construction and throughout the permitted snow trail season. These stations report real-time data\* on snow and soil conditions that may be used to help support the planning of tundra travel within NPR-A. For reference, the tundra may be considered open for off-road travel when soil temperatures reach a minimum of 23°F (-5°C) at 12 inches deep (30 cm) and snow depths average a minimum of 6 inches (15 cm). The number of stations reporting, and the dates of their last report may change throughout the winter due to transmission delays or failures. Station locations are depicted on the map below. \*The data shown is considered raw data and is reported "as-is." Weekly averages are calculated using only data from stations that have successfully transmitted for that reporting week. Water stage height is measured in feet relative to Mean Sea Level (MSL).

## CONCLUSION

**Soil temperature** at 12 inches (30 cm) depth now **averages 2.5°F (-16.4°C)**, which is **down 3.7°F from last week**. Tundra soils have now reached sufficient freezing temperatures for overland travel. **Snow depths now average 11.9" (30.2cm)**, an **increase of 0.4" from last week**. Average snow depth has reached the 6" minimum for off-road travel. Smaller streams and larger rivers within the NPR-A are continuing to freeze.
