

River Flow on Image Date:
Salmon River - 3310 CFS
Snake River - 11,500 CFS

Confluence of the Salmon and Snake Rivers
River levels on the Snake River are controlled by Hells Canyon Dam and can fluctuate during the day and/or night. If camping on the Snake River, remember to tie up all of your boats and keep gear away from waterline.

Salmon River Falls II
This long wave train, with strong eddy turbulence, is often congested. Take precautions to avoid power boat and float boat mishaps.

Eye of the Needle III
This short, very turbulent drop is harder than it looks.

Pullman Mine
Copper, gold, and silver mine was active in the 1920s. Mining equipment still visible at the mine entrance was probably brought up the Snake River by steamship.

Checkerboard II+
A long wave train with some rocks at the bottom.
