Very good - the June 13 set is still working and Bears Ears works for me again. The problem now is that I have used up my set of search phrases and only captured about 7500 comment in each of the datasets. I will browse through and see if I notice more common phrases in uncoded comments.

Mark cannot replicate the error. It seems to be working.

Still working, have coded 7500+ so far. Did not try going back to Bears Ears in case Mark was looking at it. Am breaking for lunch now. Big question will be whether it works later,

Following exactly the same steps as on the shared screen this morning, I am in the "seeds and singles" dataset I just created and those show status as codeable, and the ability to code them individually or in mass is on the line above the first comment. Now lets see if it keep working.
