TDS	total dissolved solids

1.0 EXECUTIVE SUMMARY

1.1 INTRODUCTION

On June 30, 2008, Stirling Energy Systems, LLC (SES) submitted an Application for Certification (AFC) to the California Energy Commission (CEC) to construct and operate the proposed SES Solar Two project, a solar electric generating system on an approximately 6,500-acre site in Imperial County, California. In addition, the applicant has applied to the United States Department of the Interior, Bureau of Land Management (BLM) for a right-of-way grant to construct and operate the project on federally owned lands managed by BLM. The project will also require BLM to process and adopt an amendment to the *California Desert Conservation Area Plan*, as amended (BLM 1980) to reflect the use of certain areas on BLM lands for a power plant and transmission lines that are proposed as part of the Solar Two project.

The BLM and CEC have executed a Memorandum of Understanding (MOU) regarding their intent to prepare a joint environmental document for the proposed Solar Two project that combines these agencies' required environmental evaluation and documentation processes under the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA), respectively. The joint document will be an Environmental Impact Statement/Staff Assessment (EIS/SA).

1.2 SCOPING FOR THE SOLAR TWO PROJECT

This report describes the scoping activities conducted by the BLM in compliance with the requirements of NEPA for the proposed project. These scoping activities were conducted jointly with the CEC. This report provides documentation that the BLM appropriately conducted scoping for the proposed project consistent with the requirements of NEPA and with the *BLM National Environmental Policy Act Handbook H-1790-1* (BLM, January 2008).

Public notice regarding the proposed EIS/SA and two scoping meetings was provided as follows:

- A "Notice of Intent (NOI) to prepare an Environmental Impact Statement/Staff Assessment and Proposed Land Use Plan Amendment for the Proposed SES Solar Two Project, Imperial County, CA" was published by the BLM in the Federal Register on October 17, 2008. The publication of the NOI initiated the 45-day public scoping period for the project.
- The CEC issued a "Notice of Informational Hearing and Public Site Visit and Bureau of Land Management Scoping Meeting" on October 10, 2008, inviting agencies and the public to attend a scoping meeting on November 24, 2008.
- The CEC issued a "Notice of BLM and Energy Commission Staff Data Response and Issues Resolution/Scoping Meeting for the SES Solar Two Project" on December 2, 2008, for a workshop/scoping meeting scheduled for December 18, 2008.

- Notices of the November 24, 2008 scoping meeting were published in the *Imperial Valley Press* on November 15, 2008, and the *Adelante Valle* on November 28, 2008.
- The public information/scoping meetings were conducted jointly by the BLM and CEC on November 24, 2008, and December 18, 2008.

Verbal comments were received from 20 attendees and written comment cards were received from many of the attendees at the November 24, 2008, scoping meeting. Verbal comments were received from 20 attendees and written comment cards were received from many of the attendees at the December 18, 2008, scoping meeting. In addition, the CEC received a total of 13 written comment letters in response to the NOI.

Section 3.0, Public Notices and Public Comments, describes the scoping process for the proposed Solar Two project in more detail.

1.3 SUMMARY OF COMMENTS RECEIVED DURING SCOPING

The verbal and written comments received during the scoping period covered a number of topics as summarized below. More detailed summaries of these comments are provided later in Section 3.0. In addition, the transcripts from the scoping meetings and the written letters received by the CEC are provided in appendices to this report.

1.3.1 Purpose and Need

- Provide a clear and objective statement of the project's purpose and need;
- Confirm when the power will actually be needed in San Diego; and
- Concern that the energy generated will go to San Diego with none to the Imperial Irrigation District (IID) or other nearby land uses.

1.3.2 Project Description

A number of questions and comments regarding the proposed project were provided, as follows:

- **Technology:**
 - Concerns regarding the commercial viability of the proposed SES technology
 - The mean time between failure (MTBF) at the New Mexico site
 - The differences between Sandia, New Mexico, and the Imperial Valley because that prototype was of a smaller scale and in a different type of area
 - Regarding how the Solar Two energy generation process works
 - The reliability of the process and the ability to provide the number of solar dishes (called SunCatchers) proposed for this and other projects
 - In early phases without details on manufacturing of the project components
 - The estimated MTBF for the Solar Two project
 - Going from small prototype to large-scale commercial facility without an intermediate level of facility or experience
 - How the technology will work

- How the facility components will hold up to desert weather
- Whether other technologies would quickly make the Solar Two technology obsolete
- SunCatcher reliability is not proven in actual operation
- Stirling engines are not successfully adapted for other commercial uses
- Issues related to metal creep, metal fatigue, and seal integrity
- The viability of the proposed technology
- The availability of technical information on the technology
- **Phasing:**
 - Consider granting right-of-way for Phase I only, with Phase II dependent on approval and finalization of the Sunrise Power Link project and resolution of additional issues regarding the Solar Two project
 - Consider a level of project between the small amount of units tested at Sandia and the total proposed number of units for the Solar Two project
 - Suggest 1 megawatt
 - Concern with how the project will be phased
- **Project Features:**
 - Concerns regarding the relationship of the Southwest Power Link project to the Solar Two Project
 - The role of Sempra
 - Consider deferral of the Southwest Power Link project until it's needed in the future
 - The locations of the SunCatchers on the site
 - Whether the Sunrise Power Link project has sufficient transmission capacity available for the Solar Two project
 - Whether other sources of capacity are available
 - Need a better description of evaporation ponds and the waste materials generated in those ponds
 - Transmission lines go through open desert or through Anza Borrego Desert State Park?
 - The life expectancy of the SunCatcher dishes and what happens when they are abandoned
 - The need for the Sunrise Power Link project and whether Solar Two is dependent on that project
 - Whether there is available capacity in the Southwest Power Link project
 - Why the fabrication factory is not being constructed in the project area
 - The effects of wind on the project components
 - The potential value and disposal of scrap metal when the project is decommissioned
 - How access and other considerations regarding parcels that are not part of the project or are immediately adjacent to the project site will be addressed
- **Project Operations:**
 - Concerns regarding why the electricity generated by Solar Two is not going to be available to IID for use in Imperial County
 - What factors will contribute to MTBF and ongoing facility maintenance
 - How materials needed for the project will be brought to the site
 - The amount of hydrogen that will be stored on site and where it will be stored
 - The effect of higher summer temperatures in Imperial County on the Solar Two system
 - The amount of water needed for mirror cleaning

- The amount of runoff onto the ground versus evaporation
- The management and maintenance of the impoundment areas
- How the waste impoundment areas will be addressed when the facility is decommissioned, including restoration of the land occupied by the impoundment areas
- The potential effects of sand on the facility
- The need for data on current wind conditions to understand the effects of wind resulting in downtime
- The effects of high winds and fine-grained dust on the moveable parts of the SunCatcher assembly
- How the assembly will be protected from the effects of high winds and dust
- The effect of high winds and fine-grained dust on the MTBF and the need to clean the mirrors
- The frequency of cleaning the mirrors
- The effect of gypsum dust from the U.S. Gypsum Plaster City factory may have on the facilities
- When would project construction start?
- **Right-of-Way:**
 - Consider establishing requirements for a demonstration of technological and economic viability with 3 to 5 years of approval of right-of-way before extending the length of the right-of-way approval
- **Funding and Financing:**
 - Conduct analysis of the energy return on investment to assess the net energy production value of the project
 - Want cash bonds to cover future decommissioning and site clean up and restoration costs with bonds phased with the project phasing
 - What is the financial experience of the project financial backers for this type of project
 - Where will the money come from that is needed for the entire project
 - Will the components have any resale or recycling value after decommissioning
 - Who will be responsible for the bond costs
 - Concern the project may not be cost competitive
 - Who is financially responsible for cleanup if the technology is not successful
 - What is the cost for and/or liability of the taxpayers?
 - Commercial availability and viability of the technology
 - Availability/sources of funding
 - Concern regarding public investment in the Sunrise Power Link project, which is part of the cost of the Solar Two project
 - Concerned that use of public land is to ensure profitability of the project
 - Will project funding sources include federal funding?
 - Where will the engines will be on site?
 - Will an anemometer be used to study winds?
 - When will the draft land use amendment be released?

1.3.3 Alternatives

- Provide a robust range of alternatives
- Explain why some alternatives were eliminated

- Look at alternative sites, capacities, and technologies
- Look at alternatives to avoid the impacts of the project on cultural resources and to reduce the reliance on fossil fuels
- The No Project Alternative could include other energy-generating options
- Install units in San Diego County closer to the users of the electricity
- Install units at dispersed locations in Imperial County such as the prison, schools, hospitals, and IID
- Consider alternative sites such as Mesquite Lake, which is zoned for industrial uses, or other sites already disturbed by agricultural or other uses
- Look at multiple smaller sites
- Use the SES technology at existing natural gas or coal-fired power plants
- Consider a site closer to water sources to take advantage of gravity flow and avoid the need for pumps
- Consider alternative sources for San Diego such as rooftop solar, photovoltaics, and distributed electricity
- Concern that industry thinks public lands are a less expensive way of getting land than using fallowed farmlands, abandoned feedlots, areas where the soil is sterile, parking lots, rooftops
- Consider a shift from large mega stations to decentralized, localized, and alternative sources

1.3.4 Air Quality

- Provide a detailed discussion of ambient air quality
- Quantify project emissions
- Identify emissions sources (mobile, stationary, ground disturbance)
- Identify the need for an Equipment Emissions Mitigation Plan (EEMP) and Fugitive Dust Control Plan during construction
- Prevention of air quality impacts during construction and operation
- Dust and potential health (asthma) effects
- Effects of sand storms and “white clouds” from Plaster City
- Potential impacts related to dust, hydrogen gas, and diesel emissions
- Cumulative impacts with other area land uses
- Concerns regarding carbon sequestration on the affected lands
- The need for an air quality permit and dust mitigation
- Concern about dust generation on project roads
- Effects of dust on the mirrors and other moving parts of the Solar Two project

1.3.5 Biological Resources

- Address threatened and endangered species, including baseline conditions and avoidance, minimization, and mitigation measures
- Long-term management and monitoring efforts
- Impacts to sensitive plants and animals
- Conduct species surveys at appropriate times of the year
- Potential impacts of scraping for roads on sensitive and rare plants and animals
- Strategies to minimize attracting birds and other wildlife to the wastewater impoundment areas
- Prioritize protection of species in the project area
- Develop best management practices (BMPs) and other steps to minimize and mitigate impacts on resources;
- Potential impacts to big horn sheep and sheep migration route to Mexico
- Status of jurisdictional delineation and whether it addresses transmission or water lines off the project site
- Effects on the burrowing owl and flat-tailed horned lizard
- Whether the project will require a Streambed Alteration Agreement from the California Department of Fish and Game (CDFG)

1.3.6 Climate Change

- Address climate change and how climate change could potentially affect the project
- Identify any climate change benefits of the project
- Address potential effects of climate change on demographics in San Diego

1.3.7 Cumulative Impacts

- Clearly identify resources that may be cumulatively impacted and the geographic area that will be impacted by the project
- Look at past impacts on resources
- Identify opportunities to avoid and minimize cumulative impacts
- Consider potential for cumulative impacts of this project and other nonrenewable and renewable energy, and land development projects
- Cumulative impacts on biological resources, cultural resources, environmental justice, air quality, visual, and recreation uses/users
- Cumulative impacts of solar and geothermal projects on BLM lands on cultural resources
- Cumulative impacts of various renewable energy projects on 2.5 million acres of BLM lands

1.3.8 Cultural Resources and Consultation with Tribal Governments

- Describe the process for and outcome of government-to-government consultation
- Ongoing consultation with Native American tribes is needed
- Discuss any National Register of Historic Places (National Register) properties and any Indian Sacred Sites
- Development of a Cultural Resources Management Plan
- Need complete surveys of the project site
- Local archaeologists should be considered
- Prioritize protection of cultural resources
- Develop strategies to minimize and mitigate effects on cultural resources
- Cultural resource studies should be evaluated by outside consultants familiar with the area
- Address issues related to the site potentially being designated as an Area of Traditional Cultural Concern (ATCC)
- Seek input from the State Historic Preservation Officer (SHPO)
- Concern regarding impacts on cultural resources, National Register resources, archaeological sites, historic trails, Lake Kuwae, District for the Yuha Intaglios, and cremation sites
- Concern regarding the survival of Native American culture
- Wants a Native American monitor to be included in site surveys
- Area has a lot of pottery deposits that could be sacrificial burial areas
- Concerned regarding impacts outside immediate disturbance areas
- Cultural studies should be conducted by persons familiar with the desert and desert cultures
- BLM should work closely with Native Americans
- Should engage Native American leaders to provide input on the cultural integrity of the area

1.3.9 Environmental Justice

- Identify environmental justice populations in the project area and potential impacts of the project on those populations
- Identify whether the impacts are disproportionate on those populations
- Discuss any coordination with environmental justice populations

1.3.10 Hazardous Materials and Wastes

- Address the potential for direct and indirect impacts of hazardous wastes generated during project construction and operation

- Identify types and volumes of wastes
- Identify handling, storage, disposal, and management plans
- Consider alternative industrial processes using less toxic materials
- Analyze the potential effects of hydrogen leakage and identify strategies to minimize and mitigate impacts

1.3.11 Invasive Species

- Potential to introduce nonnative invasive species
- Precautions or mitigation measures to prevent invasive species and to control invasive species during construction and operation
- Need for invasive species management plan
- Restoration, as appropriate, of native species

1.3.12 Land Use

- Identify consistency and/or conflicts with federal, State, Tribal, and local land use plans, policies
- Address project and cumulative loss of public lands to other uses (particularly energy projects)
- Impacts to community character in the Ocotillo and Nomirage communities
- Definition of “limited use” designation
- Concern about the BLM land use amendment and its relationship to the updated resource management plan
- Concern on how the plan amendment will be done

1.3.13 Public Health

- Issues associated with the potential for airborne soil fungi and risks for Valley Fever
- Risks to project employees and employees/prisoners at Centinela State Prison of exposure to Valley Fever and as a general public health issue
- Concern regarding glare from mirrors to aircraft

1.3.14 Recreation

- Address project effects on recreational users in the project area, including potential hazards to those users, that are associated with the project facilities
- Identify appropriate safety precautions
- Address impacts to the recreational experience at the Plaster City Open Area, Superstition Hills Recreation Area, Painted Gorge Recreation Area, and Anza-Borrego Desert State Park

- Potential for cumulative effects on recreation uses/users and general quiet enjoyment of public lands

1.3.15 Seismic

- Potential damage/risks to project associated with seismic activity, including activity on the nearby Elsinore/Laguna Salada fault

1.3.16 Socioeconomics

- Need information on the skill levels for the kinds of jobs that will be created
- Whether those jobs will be met by existing employees in Imperial County or employees relocating from elsewhere
- Want jobs to go to local people and not people brought in from outside the community
- Need to address the economic impacts of the project

1.3.17 Traffic

- The traffic study should include traffic associated with Centinela State Prison

1.3.18 Use of Public/BLM Lands

- Recommend that BLM continue to improve its right-of-way application process, including appropriate BMPs and addressing the difference between solar development and other uses of right-of-way
- Prioritize development on already disturbed lands close to existing transmission facilities.

1.3.19 Visual

- Need to analyze potential for project visual impacts
- Dark skies impacts
- Effects on visual resources in the area
- Effects of motion-sensitive lighting
- Potential for glare impacts on motorists on Interstate 8 (I-8), other streets, and United States Navy, United States Border Patrol, and general aviation activities in the area
- Assess visual impacts consistent with the BLM Visual Resources Manual

1.3.20 Water Resources Quality, Supply and Use

- Evaluate the project need for water and effects on water supply
- Sources of water for the project
- Adequacy of water supplies for the project
- Direct and indirect effects on groundwater
- Impacts on springs, open water bodies, and other aquatic resources
- Impacts on the Ocotillo/Nomirage aquifer
- Confirm that needed water is available and consistent with existing CEC policy
- Should not use drinking quality water from the Ocotillo aquifer for industrial uses
- Has IID committed to provide the water needed for the project
- Effects of floods on project facilities
- Project facilities located in floodplains
- Concerns regarding how total dissolved solids (TDS) in the wastewater impoundment areas will be handled to avoid runoff outside the impoundment areas or becoming airborne as dust
- How will TDS be disposed of?
- The potential need for a Section 404 permit
- Need to describe/discuss any Section 303(d) impaired waters in the project area
- Will the project need a general or individual storm water permit during construction
- Has consultation with the appropriate water quality control agencies been initiated?
- The amount of water that would be stored on site and the issue of evaporation of that water
- The issue of high TDS in area groundwater

In addition to these comments on technical and project-related issues, many of the comments also indicated either support for or opposition to the project. There were also comments indicating support for renewable energy projects in general.

2.0 INTRODUCTION

2.1 PROJECT OVERVIEW

On June 30, 2008, Stirling Energy Systems, LLC (SES), the project applicant, submitted an Application for Certification (AFC) to the California Energy Commission (CEC) to construct and operate the proposed SES Solar Two project, a solar electric generating system project in Imperial County, California. In addition, the applicant has applied to the United States Department of the Interior, Bureau of Land Management (BLM) for a right-of-way grant to construct and operate the project on federally owned lands managed by BLM. The project will also require BLM to process and adopt an amendment to the *California Desert Conservation Area Plan*, as amended (BLM, 1980) to reflect the use of certain areas of BLM lands for a power plant and transmission lines that are proposed as part of the Solar Two project.

The SES Solar Two project is proposed on an approximately 6,500-acre (ac) site consisting of approximately 6,140 ac of federal land managed by BLM and approximately 360 ac of privately owned land. The project site is approximately 100 miles (mi) east of San Diego, 14 mi west of El Centro, and 4 mi east of Ocotillo Wells. The project site and key project features are shown on Figure 2.1.

The project would be a nominal 750-megawatt (mW) Stirling engine project, with approximately 30,000 25-kilowatt (kW) solar dishes referred to as SunCatchers. The project technology is proprietary to SES Solar Two, LLC. This project is one of many projects proposed in California to provide electricity using renewable resources such as solar, wind, and geothermal energy.

In addition to the SunCatchers, the project will require the construction of a 230-kilovolt (kV) substation located approximately in the middle of the site. That substation would be connected to the existing San Diego Gas and Electric (SDG&E) Imperial Valley Substation by a new, approximately 10.3 mi long, double-circuit, 230 kV transmission line between the two substations.

The BLM and CEC have executed a Memorandum of Understanding (MOU) regarding their intent to prepare a joint environmental document for the proposed Solar Two project that combines these agencies' required environmental evaluation and documentation processes under the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA).

This report summarizes the scoping activities conducted by the BLM and CEC in late 2008 and early 2009 for the proposed Solar Two project.

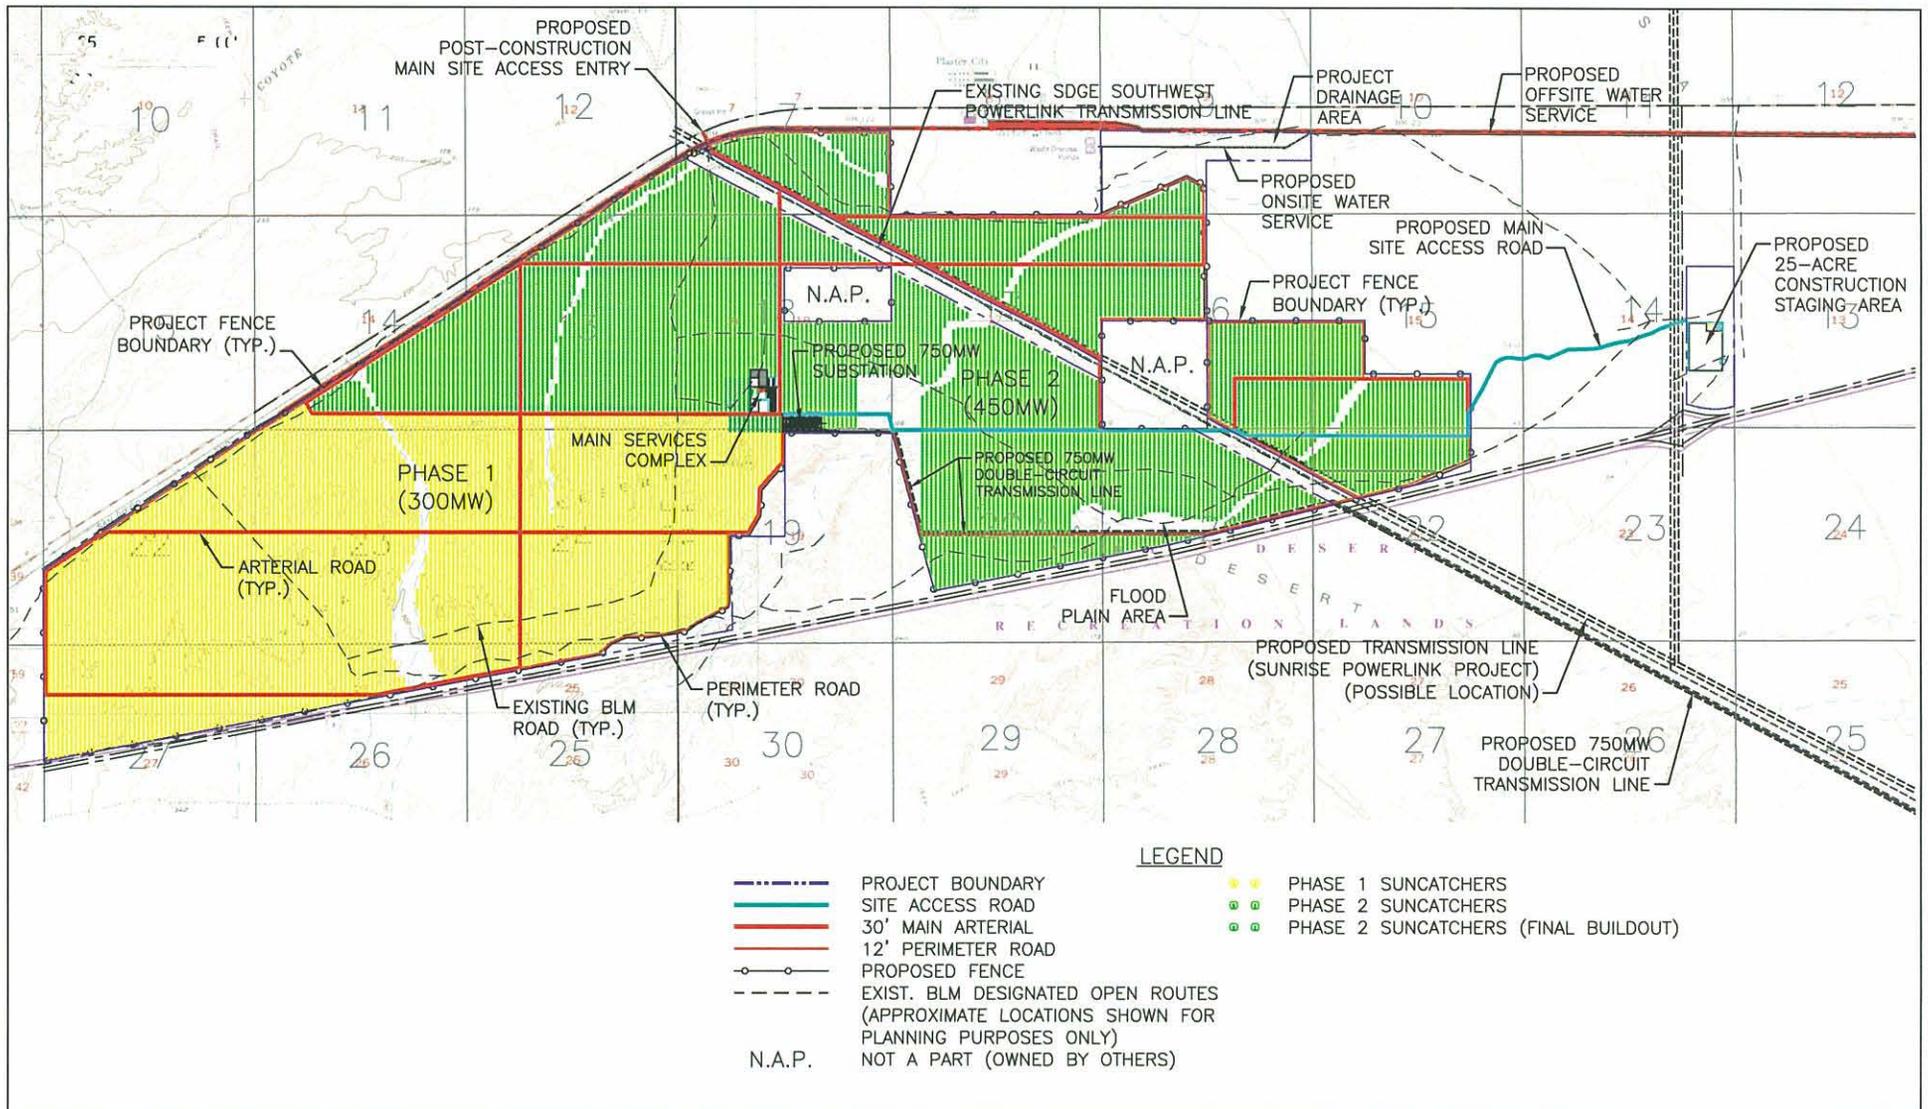

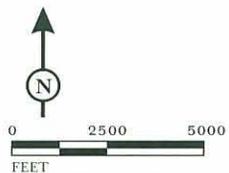

FIGURE 2.1

Stirling Energy Systems Solar Two Project
Bureau of Land Management Scoping Report
Project Site and Key Project Features

2.2 FEDERAL LEAD AGENCY

The BLM is the federal Lead Agency for the SES Solar Two project approvals related to the use of federal land for the project and the amendment to the *California Desert Conservation Plan*. The BLM has determined that an Environmental Impact Statement (EIS) is the appropriate environmental document for the identification and evaluation of the potential environmental impacts of the proposed project under NEPA.

As of the completion of the scoping process for the Solar Two project, no other federal agencies have requested to be cooperating or participating agencies on the EIS for the project.

This report provides documentation that the BLM appropriately conducted scoping for the proposed project consistent with the requirements of NEPA and with the *BLM National Environmental Policy Act Handbook H-1790-1* (BLM, January 2008).

2.3 STATE LEAD AGENCY

The CEC is the State Lead Agency for the SES Solar Two project approval for the AFC. The CEC will prepare a Preliminary Staff Assessment (PSA) and a Final Staff Assessment (FSA) as the appropriate environmental documents for the project under CEQA. The PSA and FSA will be prepared consistent with the CEC's established process for the identification and evaluation of the potential environmental impacts of a project under CEQA as part of its overall process for the consideration of AFCs for energy projects in California.

2.4 OVERVIEW OF THE SCOPING PROCESS

As discussed in Section 9.1.3, Scoping, in the *BLM National Environmental Policy Act Handbook H-1790-1*, the intent of the scoping process under NEPA is to:

- Invite participation from affected federal, state, local, and tribal organizations and interested persons;
- Determine the scope of the EIS and the significant issues to be analyzed, including identifying potential connected or cumulative actions;
- Identify other environmental documents that may have relevance for the project EIS;
- Identify other environmental review and consultation requirements for the project; and
- Discuss the timing of the preparation and processing of the EIS and the overall planning and decision-making schedule for the project.

This scoping report describes actions taken by the BLM and the CEC to solicit agencies' and interested parties' input into the environmental review processes for the proposed Solar Two project. This scoping report also documents the written and verbal comments received by the BLM and CEC during the scoping period for the project.

3.0 PUBLIC NOTICES AND PUBLIC COMMENTS

3.1 PUBLICATION OF THE NOTICE OF INTENT

A “Notice of Intent (NOI) to prepare an Environmental Impact Statement/Staff Assessment (EIS/SA) and Proposed Land Use Plan Amendment for the Proposed SES Solar Two Project, Imperial County, CA” was published by the Bureau of Land Management (BLM) in the Federal Register on October 17, 2008. The publication of the NOI initiated the 45-day public scoping period for the project. A copy of the NOI is provided in Appendix A.

The California Desert District Office of the United States Department of the Interior, BLM issued a news release on October 17, 2008, providing notice to the public that the BLM and the California Energy Commission (CEC) were proposing to prepare a joint environmental document for the proposed Solar Two project. That press release is provided in Appendix B.

3.2 NOTICES OF SCOPING MEETINGS

The CEC issued a “Notice of Informational Hearing and Public Site Visit and Bureau of Land Management Scoping Meeting” on October 10, 2008, inviting agencies and the public to attend a scoping meeting on November 24, 2008, to provide input on the project and the issues to be evaluated in the environmental document. The Notice is provided in Appendix C. The distribution list for the notice is provided in Appendix D.

The CEC issued a “Notice of BLM and Energy Commission Staff Data Response and Issues Resolution/Scoping Meeting for the SES Solar Two Project” on December 2, 2008, for a workshop/scoping meeting scheduled for December 18, 2008. That notice, in English and Spanish, is provided in Appendix C. The distribution list for that notice is provided in Appendix D.

Notices of this scoping meeting were published in the *Imperial Valley Press* on November 15, 2008, and the *Adelante Valle* on November 28, 2008. Copies of the pages from those newspapers with the scoping meeting notice are provided in Appendix D.

3.3 SCOPING MEETINGS

3.3.1 November 24, 2008, Public Informational/Scoping Meeting

A public informational/scoping meeting was conducted by the BLM and CEC on November 24, 2008. The meeting was held at the Imperial County Administration Center Board Chambers (940 West Main Street, El Centro, CA 92243). Stirling Energy Systems, LLC (SES), with support from its consultants (URS Corporation), assisted in hosting this meeting.

The format of the meeting was a combination of formal presentations, an open house, and a public hearing during which public input was documented by a court reporter.

The following documents were provided to the attendees at the November 24 meeting:

- Solar Two Fact Sheets in English and Spanish (Appendix E)
- Comment Cards in English and Spanish (Appendix F)
- Informational Hearing and Site Visit Presentation and Handouts in English (Appendix G)

Other materials at this scoping meeting were:

- Sign-in Sheets in English and Spanish (Appendix H)
- Informational Display Boards in English and Spanish (Appendix I)

The formal presentations started with a presentation by the CEC Public Advisor's Office representative regarding the public information and participation process for the proposed project. A copy of that PowerPoint presentation is provided in Appendix G. This presentation was also provided as a hard copy handout at the scoping meeting.

At the November 24 meeting, Jim Stobaugh (BLM Project Manager), Christopher Meyer (CEC Project Manager), and John Egan (SES Senior Director of Project Development) presented an overview of the proposed project and the California Environmental Quality Act (CEQA)/National Environmental Policy Act (NEPA) process for the project. A copy of that PowerPoint presentation is provided in Appendix J. This presentation was also given at the December 12, 2008, workshop/scoping meeting.

Following the presentation, questions and comments were taken by Messrs. Stobaugh, Meyer, and Egan, who were assisted by other SES and URS Corporation staff. A copy of the transcript of this meeting, including comments received from the meeting attendees, is provided in Appendix K. As shown in that transcript, 20 attendees asked questions or provided verbal comments. In addition to the opportunity to provide verbal input, meeting attendees were also encouraged to provide written comments on the comment cards provided at the meeting. Written comments cards were received from some of the meeting attendees. The written comments provided on comment cards at this meeting were provided by the same attendees who provided verbal comments as documented in the meeting transcript. In addition, many of the attendees also submitted comment letters, as described later. The comments provided in the transcript and on the written comment cards are summarized later in this report.

Following the presentation and comment session, meeting attendees were invited to participate in a project site visit. The purpose of the site visit was to offer members of the public a first-hand view of the site for the proposed Solar Two project. The site visit was attended by CEC, BLM, SES, and URS staff, and members of the public. During the site visit, SES and URS technical staff described the size and scale of the proposed project. Additionally, an informal question and answer session was held and members of the SES and URS technical staff were available to respond to those questions and comments.

3.3.2 December 18, 2008, Workshop/Scoping Meeting

The December 18, 2008, workshop/scoping meeting was a data response and issues resolution workshop for SES to address BLM and CEC data requests Set 1 Parts 1 & 2 (1–127), the Issues Identification Report, and public comments received at the November 24, 2008, scoping meeting. This workshop also served as a second scoping meeting for the BLM right-of-way application and proposed amendment to the *California Desert Conservation Area Plan*. This workshop/meeting was formatted similar to the November 24 meeting, with a formal presentation, an open house, and a hearing during which public input was documented by a court reporter.

The following documents were provided to the attendees at the December 18 workshop/meeting (the same materials were provided at the November 24, 2008, scoping meeting):

- Solar Two Fact Sheets in English and Spanish (Appendix E)
- Comment Cards in English and Spanish (Appendix F)

Other materials at the December 18 workshop/meeting, which also were the same as those provided at the November 24 scoping meeting, were:

- Sign-in Sheets in English and Spanish (Appendix H)
- Informational Display Boards in English and Spanish (Appendix I)

During the December 18 workshop/meeting, Messrs. Stobaugh, Meyer, and Egan presented an overview of the proposed project and the CEQA/NEPA process for the project. Following the presentations, questions and comments were taken by Messrs. Stobaugh, Meyer, and Egan. Public questions and comments that focused primarily on specific resource areas and data requests were also responded to by SES and URS Corporation technical staff. A copy of the PowerPoint presentation presented at that meeting is provided in Appendix J.

A copy of the transcript of the December 18 workshop/meeting, including comments received from the meeting attendees, is provided in Appendix L. As shown in that transcript, six attendees asked questions or provided verbal comments. In addition to the opportunity to provide verbal input, meeting attendees were also encouraged to provide written comments on the comment cards provided at the meeting. Written comments cards were received from some of the meeting attendees. The written comments provided on comment cards at this meeting were provided by the same attendees who provided verbal comments as documented in the meeting transcript. In addition, many of the attendees also submitted comment letters, as described later. The comments provided in the transcript and the written comment cards are summarized later in this report.

3.4 SCOPING PERIOD

As noted earlier, the 45-day scoping period started on October 17, 2008, on the publication date of the NOI in the Federal Register, and ended on January 2, 2009. During that time, comments were received as follows:

- Written comment letters provided to the CEC
- Verbal comments received at the two scoping meetings

These comments are summarized in the following sections.

3.4.1 Written Comments Received by the CEC

During the scoping period, the CEC received comment letters from the following:

- **Public Agencies**
 - United States Environmental Protection Agency (November 14, 2008)
 - Imperial Irrigation District (November 24, 2008)
- **Groups and Organizations**
 - El Centro Chamber of Commerce and Visitors Bureau (November 24, 2008)
 - Desert Protective Council (December 30, 2008)
 - The Wilderness Society and the Natural Resources Defense Council (December 31, 2008)
 - Sierra Club, San Diego Chapter (January 2, 2009)
 - Mussey Grade Road Alliance (January 2, 2009)
- **Members of the General Public**
 - Marilyn Moskowitz (December 23, 2008)
 - Richard A. Ayers (December 27, 2008)
 - Cheryl Lenz (January 2, 2009)
 - Charlene Ayers (January 2, 2009)
 - Donna Tisdale (January 2, 2009)
 - Denis Trafecanty (January 3, 2009)

Copies of these comment letters are provided in Appendix M. Table 3.A summarizes the comments provided in these letters and indicates where in the environmental document those topics will be addressed. The tables cited in this section are provided following the last page of text in this section.

3.4.2 Verbal Comments Received at the Scoping Meetings

Verbal comments were received from the following at the November 24, 2008, scoping meeting as documented in the transcript of that meeting:

- Paul Foley, California Unions for Reliable Energy (CURE)
- Gary Wyatt, Supervisor, Imperial County
- John Mennvielle, President, Imperial Irrigation District Board of Directors
- Mark Gran, City Council Member, City of Imperial
- Marlene Best, Imperial Valley Economic Development Corporation
- Connie Bergmark, Resident, Imperial Lakes

- Jennifer Donovan, Resident, Imperial Lakes
- Maurice Lam
- Dennis Trafecanty, Protect Our Communities Fund, San Diego Foundation
- Laura McDonald, San Diego Gas and Electric (SDG&E)
- Carroll Buckley, President of the El Centro Chamber of Commerce and Visitors Bureau
- Karen Collins
- Tim Kelly, President and Chief Executive Officer of the Imperial Valley Economic Development Corporation
- Christina Luhn, San Diego Regional Economic Development Corporation
- Steve Taylor, SDG&E
- Carmen Lucas
- Elias Felix
- Donna Tisdale
- Edie Harmon
- Thomas Topuzes, Co-Chair, MegaRegion Initiative
- Tim Dubose, Second Vice-President, Building Industry Association, Desert Chapter

A copy of the November 24, 2008, meeting transcript is provided in Appendix K. Table 3.B summarizes the comments in the transcript and indicates where in the environmental document those topics will be addressed.

Verbal comments were received from the following at the December 18, 2008, scoping meeting as documented in the transcript of that meeting:

- Paul Foley, CURE
- Edie Harmon
- Donna Tisdale
- Teri Weiner, Desert Protective Council
- Marilyn Moskowitz
- Steve Taylor, SDG&E

A copy of the transcript is provided in Appendix L. Table 3.B summarizes the comments in the transcript and indicates where in the environmental document those topics will be addressed.

3.5 ONGOING PUBLIC INFORMATION

As part of an ongoing public information process, the CEC is administering a joint agency project website that has provided and will continue to provide project-related information, meeting notices, reports, and other materials. The BLM also has a website for this project. These websites are:

- <http://www.energy.ca.gov/sitingcases/solartwo/index.html>; and
- <http://www.blm.gov/ca/st/en/fo/elcentro/nepa/stirling.html>.

Sample webshots from the CEC and BLM websites for the Solar Two project are provided in Appendix N.

Table 3.A: Summary of Written Comments Received by the CEC

Name and Agency of Commenter (and Date of Comment)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
Comment Letters from Public Agencies			
United States Environmental Protection Agency (EPA) (letter dated 11/14/08)	EPA-1	EPA supports the use of renewable energy resources.	See Note 1
	EPA-2	Purpose and Need: Provide a clear and objective statement of the project's purpose and need.	Purpose and Need
	EPA-3	Alternatives: Provide a robust range of alternatives; explain why some alternatives were eliminated; look at alternative sites, capacities, technologies.	Alternatives
	EPA-4	Biological Resources: Address threatened and endangered species in detail, including baseline conditions; how avoidance, minimization, and mitigation measures will protect species; and long-term management and monitoring efforts.	Biological Resources and Areas of Critical Environmental Concern
	EPA-5	Air Quality: Detailed discussion of ambient air quality; quantify project emissions; identify emissions sources (mobile, stationary, ground disturbance); identify the need for an Equipment Emissions Mitigation Plan (EEMP) and Fugitive Dust Control Plan during construction.	Air Quality
	EPA-6	Climate Change: Address climate change and how climate change could potentially affect the project; identify any climate change benefits of the project.	Air Quality
	EPA-7	Cumulative Impacts: Clearly identify resources that may be cumulatively impacted and the geographic area that will be impacted by the project; look at past impacts on resources; identify opportunities to avoid and minimize cumulative impacts.	Cumulative Impacts (in sections by environmental parameter)
	EPA-8	Water Resources: Evaluate project need for water and effects on water supply.	Hydrology, Water Use, and Water Quality
	EPA-9	Groundwater: Direct and indirect effects on groundwater.	Hydrology, Water Use, and Water Quality
	EPA-10	Water Resources: Impacts on springs, open water bodies, other aquatic resources.	Hydrology, Water Use, and Water Quality, and Biological Resources
	EPA-11	Water Use: Clarify the water rights permitting process.	Project Description
	EPA-12	Water Quality: Potential need for a Section 404 permit.	Hydrology, Water Use, and Water Quality, and Biological Resources

Table 3.A: Summary of Written Comments Received by the CEC

Name and Agency of Commenter (and Date of Comment)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	EPA-13	Water Quality: Discuss any Section 303(d) impaired waters in the project area.	Hydrology, Water Use, and Water Quality
	EPA-14	Consultation with Tribal Governments: Describe process for and outcome of government-to-government consultation; discuss any National Register of Historic Places properties and any Indian Sacred Sites; and development of a Cultural Resources Management Plan.	Cultural Resources and Native American Values
	EPA-15	Environmental Justice: Identify environmental justice populations in the project area and potential impacts of the project on those populations; identify whether the impacts are disproportionate on those populations; discuss any coordination with environmental justice populations.	Socioeconomics and Environmental Justice
	EPA-16	Recreation: Address effects of the project on recreational users in the project area, including potential hazards to those users associated with the project facilities; identify appropriate safety precautions.	Land Use
	EPA-17	Invasive Species: Address potential for project to introduce invasive species; how they will be controlled; development of an invasive species management plan; and restoration, as appropriate, of native species.	Biological Resources
	EPA-18	Hazardous Materials and Wastes: Address the potential for direct, indirect, and cumulative impacts of hazardous wastes generated during project construction and operation; identify types and volumes of wastes; identify handling, storage, disposal, and management plans; alternative industrial processes using less toxic materials should be considered.	Hazardous Materials Management
	EPA-19	Land Use: Identify consistency and/or conflicts with federal, State, Tribal, and local land use plans, policies, and controls in the project study area.	Land Use
Imperial Irrigation District (IID) (letter dated 11/24/08) (see Note 3)	IID-1	Supports the proposed Solar Two project.	See Note 1
Comment Letters from Groups and Organizations			
El Centro Chamber of Commerce and Visitors Bureau (letter dated 11/24/08) (see Note 3)	ECCC-1	Supports the proposed Solar Two project.	See Note 1

Table 3.A: Summary of Written Comments Received by the CEC

Name and Agency of Commenter (and Date of Comment)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
Teri Weiner, Imperial County Projects and Conservation Coordinator, Desert Protective Council (letter dated 12/30/08) (see Note 3)	DPC-1	Cultural Resources: Complete surveys of cultural artifacts, sites, and areas in the project area are needed; local archaeologists should be considered; consultation with Native American tribes is needed; need to address cumulative impacts.	Cultural Resources
	DPC-2	Land Use: Need to address project and cumulative loss of public lands to other uses (particularly energy projects).	Land Use
	DPC-3	Biological Resources: Need to address impacts to sensitive plants and animals; conduct species surveys at appropriate times of the year.	Biological Resources
	DPC-4	Invasive Species: Control of invasive species during construction and operation.	Biological Resources
	DPC-5	Animals and Plants: Potential impacts of scraping for roads on sensitive and rare plants and animals.	Biological Resources
	DPC-6	Air Quality: Air quality (PM ₁₀ [particulate matter less than 10 microns in size]); prevention of air quality impacts during project construction and operation.	Air Quality
	DPC-7	Water Supplies/Use: Impacts on Ocotillo/Nomirage aquifer; overall effect on demand for water.	Hydrology, Water Use, and Water Quality
	DPC-9	Land Use, Visual, and Noise: Impacts to community character in the Ocotillo and Nomirage communities; dark skies impacts; noise impacts.	Land Use, Visual Resources, Noise
	DPC-10	Aviation Impacts: Air space impacts; glare to pilots.	Health and Safety
	DPC-11	Recreation: Address impacts to recreational experience at the Plaster City Open Area, Superstition Hills Recreation Area, Painted Gorge Recreation Area, and Anza-Borrego Desert State Park.	Land Use
	Alex Daue, Renewable Energy Coordinator, The Wilderness Society, and Johanna Wald, Senior Attorney, Natural Resources Defense Council (letter dated 12/31/08)	TWS-1	Description of the Wilderness Society and the Natural Resources Defense Council.
TWS-2		Supports responsible use of renewable energy resources in a responsible manner when on public lands.	See Note 1
TWS-3		Recommend that United States Department of the Interior, Bureau of Land Management (BLM) continue to improve its right-of-way application process, including appropriate best management practices (BMPs) and addressing the difference between solar development and other uses of right-of-way, and prioritize development on already disturbed lands close to existing transmission facilities.	See Note 1

Table 3.A: Summary of Written Comments Received by the CEC

Name and Agency of Commenter (and Date of Comment)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	TWS-4	Project Description: The Solar Two site appears to have potential for developing solar energy with fewer impacts to resources than other areas managed by BLM; should prioritize on already disturbed lands and in proximity to existing transmission lines.	Project Description
	TWS-5	Minimize and mitigate unavoidable impacts to resources and values.	In sections by environmental parameter.
	TWS-6	Cultural Resources: Prioritize protection of area's cultural resources; develop strategies to minimize and mitigate unavoidable effects on cultural resources; conduct ongoing consultation with local Native American tribes.	Cultural Resources
	TWS-7	Biological Resources: Prioritize protection of species in the project area; analyze project impacts on species; develop BMPs and other steps to minimize and mitigate unavoidable impacts on resources.	Biological Resources
	TWS-8	Water Supply/Use: Confirm that the water needed for the project is available and consistent with existing California Energy Commission (CEC) policy.	Hydrology, Water Use, and Water Quality
	TWS-9	Project Description: Concerns regarding viability of technology.	Project Description
	TWS-10	Project Phasing: Consider granting right-of-way for Phase I only, with Phase II dependent on approval finalization of the Sunrise Power Link project and resolution of additional issues regarding the Solar Two project.	Project Description
	TWS-11	Project Phasing: Consider establishing requirements for a demonstration of technological and economic viability with 3 to 5 years of approval of right-of-way before extending the length of the right-of-way approval.	Project Description
	TWS-12	Project Description: Conduct an analysis of the energy return on investment to assess the net energy production value of the project.	Project Description
	TWS-13	Hazards: Analyze the potential effects of hydrogen leakage and identify strategies to minimize and mitigate impacts.	Hazardous Materials Management
	TWS-14	Project Description/Funding: Want cash bonds to cover future decommissioning costs with bonds phased consistent with the project phasing.	Project Description
Edie Harmon, Sierra Club, San Diego Chapter (letter dated 1/2/09) (see Note 4)	SC-1	Alternatives: Analyze a range of alternatives to avoid the impacts of the project on cultural resources and to overall reduce the reliance on fossil fuels.	Alternatives
	SC-2	Alternatives: Suggest No Project Alternative include other energy-generating options.	Alternatives

Table 3.A: Summary of Written Comments Received by the CEC

Name and Agency of Commenter (and Date of Comment)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	SC-3	Alternative Use of Funds: Suggest using money from Solar Two and Sunrise Power Link projects for conservation and weatherization improvements.	See Note 1
	SC-4	Alternatives: Suggest installing units in San Diego County closer to the users of the electricity.	Alternatives
	SC-5	Alternatives: Suggest installing units in Imperial County at dispersed locations.	Alternatives
	SC-6	Alternative Sites: Suggest looking at alternative sites such as Mesquite Lake that are already disturbed or looking at multiple smaller sites.	Alternatives
	SC-7	Alternatives: Use the Stirling SunCatcher dish at existing natural gas or coal-fired power plants.	Alternatives
	SC-8	Project Description: Why is the electricity generated by Solar Two not going to be available to IID for use in Imperial County?	Project Description
	SC-9	Project Description and Air Quality: How will high winds and fine-grained dust affect the moveable parts of the SunCatcher assembly? How will the assembly be protected from the effects of high winds and dust?	Project Description Air Quality
	SC-10	Project Description: What will be the effect of high winds and fine-grained dust on the mean time between failure (MTBF) and the need to clean the mirrors?	Project Description
	SC-11	Project Description: What effect will gypsum dust from the US Gypsum Plaster City factory have on the facilities?	Project Description
	SC-12	Project Description: What was the MTBF at the New Mexico site? What is the estimated MTBF at the proposed site?	Project Description
	SC-13	Socioeconomics: What kind of jobs at what skill levels will be created? Will those jobs be met by existing employees in Imperial County or will they require employees relocating from other areas?	Socioeconomics
	SC-14	Project Description: Concern regarding going from small prototype to large-scale commercial facility without an intermediate level of facility or experience.	Project Description
	SC-15	Phasing: How will the project be phased?	Project Description
	SC-16	Project Description: What factors will contribute to MTBF and ongoing facility maintenance?	Project Description
	SC-17	Project Description: How will materials for the project be brought to the site?	Project Description
	SC-18	Project Description: How much hydrogen will be stored on site? Where will it be located on site?	Project Description

Table 3.A: Summary of Written Comments Received by the CEC

Name and Agency of Commenter (and Date of Comment)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	SC-19	Project Funding: What is the financial experience of the project financial backers for this type of project? Where will all the money come from that is needed for the entire project?	See Note 1
	SC-20	Project Description/Funding: Want cash bonds to cover future decommissioning costs; will components have any resale or recycling value; how much material might end up in landfills; who will be responsible for the bond costs?	Project Description
	SC-21	Project Description: How will higher summer temperatures in Imperial County affect the system?	Project Description
	SC-22	Project Description: How much water will need to be used for mirror cleaning? How much will run off into the ground versus evaporation?	Project Description
	SC-23	Invasive Species: Introduction of nonnative invasive species; precautions or mitigation measures needed to prevent invasive species.	Biological Resources
	SC-24	Project Description: How will total dissolved solids (TDS) in the wastewater impoundment areas be handled to avoid runoff outside the impoundment areas or becoming airborne as dust; how will TDS be disposed of; how will the impoundment areas be managed and maintained; how will the waste impoundment areas be addressed when the facility is decommissioned, including restoration of the land occupied by the wastewater impoundment areas; what strategies will be in place to minimize attracting birds to the wastewater impoundment areas?	Project Description
	SC-25	Cultural Resources: Have all cultural resource studies been evaluated by outside consultants familiar with the area prior to release to the public?	See Note 1
	SC-26	Cultural Resources: Address issues related to site potentially being designated as an Area of Traditional Cultural Concern (ATCC).	Cultural Resources
	SC-27	Cultural Resources: Seek input from Native American groups and the State Historic Preservation Officer.	Cultural Resources
	SC-28	Visual Resources: Effect on visual resources in the area, including potential cumulative effect of this and other projects in the area.	Visual Resources
	SC-29	Traffic and Land Use: Traffic study should include traffic associated with Centinela State Prison; the prison should be labeled appropriately on figures.	Traffic and Land Use
	SC-30	Hazards: Issues associated with the potential for Valley Fever; risks to project employees and employees/prisoners at Centinela State Prison.	Health and Safety

Table 3.A: Summary of Written Comments Received by the CEC

Name and Agency of Commenter (and Date of Comment)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	SC-31	Cumulative Impacts: Consider potential for cumulative impacts of this project and other nonrenewable and renewable energy, and land development projects; cumulative impacts on biological resources, cultural resources, environmental justice, air quality, and recreation uses/users.	Cumulative Impacts (in sections by environmental parameter)
	SC-32	Seismic: Potential damage/risks to project associated with seismic activity, including activity on the nearby Elsinore/Laguna Salada fault.	Geologic Stability
Mussey Grade Road Alliance (letter dated 1/2/09)	MG-1	Scoping: Requests that this comment letter be included in the scoping record.	Scoping Report
	MG-2	Other Environmental Document: Requests that the Final Environmental Impact Report (EIR) for the Sunrise Power Link project, including its mitigation measures, be incorporated into the record for this project and used to scope the current project.	See Note 2
	MG-3	Project Description: Concerns regarding the commercial viability of the proposed Stirling Energy Systems, LLC (SES) technology; will it work; will it hold up to desert weather; not cost competitive.	Project Description
Comment Letters from Members of the General Public			
Marilyn Moskowitz (email dated 12/23/08) (see Note 3)	MM-1	Opposed to the Solar Two project.	See Note 1
	MM-2	Air Quality: Concerned regarding dust and potential health (asthma) effects on children.	Air Quality
	MM-3	Water Use: Objects to the use of drinkable water from the Ocotillo aquifer for industrial uses.	Hydrology, Water Use, and Water Quality
	MM-4	Project Description: Concerned that cleanup costs be provided in a bond.	Project Description
	MM-5	Project Description: Concerned other technologies will quickly make the Solar Two technology obsolete.	Project Description
Richard A. Ayers (letter dated 12/27/08)	RA-1	Project Description: Who is financially responsible for cleanup if the technology is not successful; taxpayer liability?	Project Description
	RA-2	Project Description/Purpose: Relationship to the Southwest Power Link and role of Sempra.	Project Description
	RA-3	Project Description: SunCatcher reliability is not proven in actual operations.	Project Description
	RA-4	Stirling engines not successfully adapted for other commercial uses.	See Note 1
	RA-5	Project Description: Issues related to metal creep, metal fatigue, and seal integrity.	Project Description

Table 3.A: Summary of Written Comments Received by the CEC

Name and Agency of Commenter (and Date of Comment)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
Cheryl Lenz (letter dated 1/2/09)	RA-6	Project Description: Need a level of project between small amount of units tested at Sandia and total proposed number of units for the Solar Two project; suggest 1 megawatt (mW)	Project Description
	RA-7	Recommends deferral of the Southwest Power Link until needed in the future.	See Note 1
	CL-1	Project Description: Who is financially responsible for cleanup if the technology is not successful; taxpayer liability?	Project Description
	CL-2	Project Description: SunCatcher reliability is not proven in actual operations.	Project Description
	CL-3	Air Quality: Effects of sand storms and "white clouds" from Plaster City.	Air Quality
Charlene Ayers (letter dated 1/2/09)	CL-4	Project Description: Need a level of project between small amount of units tested at Sandia and total proposed number of units for the Solar Two project; suggest 1 mW	Project Description
	CA-1	Project Description: Concerns regarding viability of technology and availability of technical information on the technology.	Project Description
	CA-2	Project Description: Potential effects of sand on the facility.	Project Description
Donna Tisdale (letter dated 1/2/09) (see Note 3)	CA-3	Project Description: Commercial availability and viability of the technology.	Project Description
	DT-1	Suggests rejecting the Solar Two and other projects because they do not represent the best and highest use of land, are not in the best interest of the taxpayers, and will result in loss of the use of public lands and recreation areas.	See Note 1
	DT-2	Alternatives: Other technologies are less destructive, expensive, and time consuming for approvals/litigation.	Alternatives
	DT-3	Other Environmental Document: Incorporates by reference the Final EIR and other materials for the Sunrise Power Link project in her comments.	See Note 2
	DT-4	Incorporates by reference the <i>San Diego Smart Energy 2020</i> report in her comments.	Refer to comment DT-3 above, which includes a copy of that report.
	DT-5	Project Funding: Concerned regarding availability/sources of funding.	Project Description
	DT-6	Project Description: SunCatcher reliability is not proven in actual operations.	Project Description
	DT-7	Project Description: Construction of SunCatchers on site: where will that facility be, how big will it be, what are the impacts of that facility?	Project Description
	DT-8	Land Use: Definition of "limited use" designation.	Land Use
	DT-9	Cultural Resources: Potential for additional cultural resources in the area.	Cultural Resources
DT-10	Recreation: Impacts on recreation uses and users.	Land Use	

Table 3.A: Summary of Written Comments Received by the CEC

Name and Agency of Commenter (and Date of Comment)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	DT-11	Visual Resources: Effects of motion-sensitive lighting.	Visual Resources
	DT-12	Project Description: Need data on current wind conditions to understand the effects of wind resulting in downtime.	Project Description
	DT-13	Project Description: Does Sunrise Power Link have sufficient transmission capacity available for the Solar Two project? If not, are there other sources of capacity available?	Project Description
	DT-14	Socioeconomics: What kind of jobs at what skill levels will be created? Will those jobs be met by existing employees in Imperial County or other American workers or will they require employees from other countries?	Socioeconomics
	DT-15	Visual: Potential for glare impacts on motorists on Interstate 8, other streets, and United States Navy, United States Border Patrol, and general aviation activities in the area.	Visual Resources
	DT-16	Visual: Potential for project and cumulative visual impacts.	Visual Resources
	DT-17	Cultural Resources: Potential for project and cumulative impacts on cultural resources.	Cultural Resources
	DT-18	Air Quality: Potential project impacts related to dust, hydrogen gas, and diesel emissions, and cumulative impacts with other area land uses.	Air Quality
	DT-19	Water Use: Not clear that IID has committed to provide the water needed for the project.	Hydrology, Water Use, and Water Quality
	DT-20	Hydrology: Effects on watercourses and groundwater.	Hydrology, Water Use, and Water Quality
	DT-21	Floods: Effects of rare floods on project facilities; project facilities and debris basins located in floodplains.	Hydrology, Water Use, and Water Quality
	DT-22	Project Description: Need better description of evaporation ponds and the waste materials generated in those ponds.	Project Description
	DT-24	Recreation: Cumulative effects on recreation uses/users and general quiet enjoyment of public lands.	Land Use
	DT-25	Cumulative Impacts: Potential effects related to a wide range of environmental parameters.	Cumulative Impacts (in sections by environmental parameter)
	DT-26	Value of Land: Appraisal, calculation of value of BLM lands, likely fees that would be paid to BLM.	See Note 1

Table 3.A: Summary of Written Comments Received by the CEC

Name and Agency of Commenter (and Date of Comment)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	DT-27	Project Description: Concerned that cleanup costs be provided in a bond.	Project Description
	DT-28	Alternatives: Look at different technologies.	Alternatives
Denis Trafecanty (letter dated 1/3/09) (see Note 5)	DET-1	Opposed to both the Sunrise Power Link project and the Solar Two project.	See Note 1
	DET-2	Project Description: SunCatcher reliability is not proven in actual operations.	Project Description
	DET-3	Project Description: Costs to produce electricity too high; refer to the <i>San Diego Smart Energy 2020</i> report attached to this comment.	Project Description

NOTE 1: This comment does not raise an issue under the National Environmental Policy Act (NEPA) or the California Environmental Quality Act (CEQA). All comments describing support for or opposition to the proposed project or asking for analyses not required under CEQA or NEPA will be considered by the decision-makers at the BLM and the CEC.

NOTE 2: The Final EIR for the Sunrise Power Link project (A.06-08-010) is on file at the CEC and therefore does not need to be incorporated in the record for this current project. The CEC and the BLM used that document, plus other materials and past experiences on energy projects, plus agency and public input provided during the scoping process, to scope the technical studies and environmental document for the proposed Solar Two project.

NOTE 3: This commenter also provided verbal comments at the November 24, 2008, scoping meeting and/or the December 18, 2008, workshop/scoping meeting. Refer to Table 3.B for a summary of those verbal comments. Comments from these parties are numbered consecutively, including the written comments in Table 3.A and the verbal comments in Table 3.B.

NOTE 4: Ms. Harmon also provided written comments to the CEC, as summarized in Table 3.A, as a representative of the Sierra Club, San Diego Chapter. Ms. Harmon did not indicate that she was commenting on behalf of the Sierra Club in her verbal comments provided at the two scoping meetings. Therefore, her comments at the scoping meeting are numbered as comments from an individual and separately from her comments as a representative of the Sierra Club.

NOTE 5: Mr. Trafecanty also provided written comments to the CEC, as summarized in Table 3.A, as an individual. In those written comments, Mr. Trafecanty did not indicate that he was commenting on behalf of the Protect Our Communities Fund (POCF) as he did in his verbal comments at the November 24, 2008, scoping meeting. Therefore, his verbal comments at the scoping meeting are numbered as comments from Mr. Trafecanty as a representative of POCF and separately from his written comments to the CEC as an individual.

Table 3.B: Summary of Verbal Comments Received at the November 24, 2008, and December 18, 2008, Scoping Meetings

Name and Agency of Commenter (transcript pages)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
Verbal Comments Received at the November 24, 2008, Scoping Meeting			
Paul Foley, California Unions for Reliable Energy (CURE), Intervener (pg 10)	--	No comment; acknowledged his presence as a representative of CURE as an intervener for the Solar Two project.	--
Gary Wyatt, Supervisor, Imperial County (pp 62--66)	GW-1	Supportive of renewable energy opportunities, and new industry/jobs in Imperial County; supportive of the Solar Two project.	See Note 1
John Mennvielle, President, Imperial Irrigation District (IID) Board of Directors (pp 66 and 67) (see Note 2)	IID-2	Supportive of the Solar Two project and its benefits for employment and the regional economy.	See Note 1
Mark Gran, City Council Member, City of Imperial (pp 67 and 68)	MG-1	Supportive of the Solar Two project, economic driver for the area, good paying jobs.	See Note 1
Marlene Best, Imperial Valley Economic Development Corporation (pp 68 and 69)	MB-1	Supportive of the Solar Two project and the economic and employment benefits.	See Note 1
Connie Bergmark, Resident, Imperial Lakes (pp 69 and 70)	CB-1	Public Participation: Supportive of renewable energy, wants to be kept informed about construction and operations as project progresses.	Public Coordination
Jennifer Donavan, Resident, Imperial Lakes (pg 70)	JD-1	Supportive of Solar Two project and employment and economic benefits.	See Note 1
Maurice Lam (pp 71 and 72)	ML-1	Supportive of Solar Two project and employment and economic benefits; area has substantial resources to offer to project.	See Note 1
Dennis Trafecanty, Protect Our Communities Fund, San	POCF-1	Project Description: Concerned about Stirling Energy Systems, LLC (SES) and the Solar Two project; concerned about the commercial viability of the project.	Project Description
	POCF-2	Project Description: Concerned about availability of funding for the project.	Project Description

Table 3.B: Summary of Verbal Comments Received at the November 24, 2008, and December 18, 2008, Scoping Meetings

Name and Agency of Commenter (transcript pages)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
Diego Foundation (pp 73–77) (see Note 4)	POCF-3	Project Description: Relationship to the Sunrise Power Link project; does not think Sunrise Power Link project is commercial.	Project Description
	POCF-4	Project Description: Concerned regarding public investment in Sunrise Power Link, which is part of the cost of the Solar Two project.	Project Description
	POCF-5	Purpose and Need: Questions when power will actually be needed in San Diego.	Purpose and Need
	POCF-6	Air Quality and Health and Safety: Health concerns in Imperial Valley, asthma; concerned regarding bringing “dirty” fossil fuels from Mexico to support the San Diego Gas and Electric (SDG&E)/Sempra projects.	Air Quality and Health and Safety
	POCF-7	Project Description: Do not want transmission lines through open desert or through Anza Borrego Desert State Park.	Project Description
	POCF-8	Impacts to big horn sheep and sheep migration route to Mexico.	Biological Resources and Areas of Critical Environmental Concern (ACEC)
Laura McDonald, SDG&E (pp 77 and 78)	LM-1	Supportive of the Solar Two project.	See Note 1
Carroll Buckley, President of the El Centro Chamber of Commerce and Visitors Bureau (pp 78 and 79) (see Note 2)	ECCC-2	Supportive of Solar Two project and employment and economic benefits.	See Note 1
Karen Collins (pp 79–81)	KC-1	Project Description: Concerned that energy generated will go to San Diego with none to IID.	Project Description
	KC-2	Project Description: Concern regarding life expectancy of dishes and what happens when they are abandoned.	Project Description
	KC-3	Cultural Resources: Concerned regarding impacts on cultural resources, National Register of Historic Places resources, Lake Kuwae, District for the Yuha Intaglios, cremation sites.	Cultural Resources
	KC-4	Alternatives: Suggests sites already disturbed by agricultural uses.	Alternatives
	KC-5	Alternatives: Site closer to water sources to take advantage of gravity flow and avoid the need for pumps.	Alternatives

Table 3.B: Summary of Verbal Comments Received at the November 24, 2008, and December 18, 2008, Scoping Meetings

Name and Agency of Commenter (transcript pages)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	KC-6	Water Supplies/Use: Does not think there is sufficient water available for the project.	Hydrology, Water Use, and Water Quality
Tim Kelly, President and Chief Executive Officer of the Imperial Valley Economic Development Corporation (pp 81–84)	TK-1	Appreciates current economic benefits based on presence of SES in Imperial County.	See Note 1
	TK-2	Supportive of the Solar Two project, job creation, training for project jobs, dust mitigation/reduction in health impacts, tourism to see the project, generation of energy, lower rates in Imperial County.	See Note 1
Christina Luhn, San Diego Regional Economic Development Corp. (pp 84 and 85)	REDC-1	Supportive of the Solar Two project for creation of jobs in industries that have a future.	See Note 1
Steve Taylor, SDG&E (pp 85 and 86)	ST-1	Supportive of the Solar Two project and technology, benefits SDG&E achievement of defined renewable portfolio standard.	See Note 1
Carmen Lucas (pp 86–90)	CL-1	Cultural Resources: Commenter is a Native American, concerned regarding survival of culture.	Cultural Resources
	CL-2	Requests that a Native American monitor be included in site surveys.	Cultural Resources
	CL-3	Cumulative impacts of solar and geothermal projects on Bureau of Land Management (BLM) lands.	Cultural Resources
	CL-4	Cultural Resources: Wants care taken; area has a lot of pottery deposits that could be sacrificial burial areas.	Cultural Resources
	CL-5	Cultural Resources: Concerned regarding impacts outside immediate disturbance areas.	Cultural Resources
Elias Felix (pg 90)	EF-1	Supportive of the Solar Two project, economic development, educational opportunities to learn about energy production alternatives.	See Note 1
Donna Tisdale (pp 90–94) (see Note 2)	DT-29	Project Description: Relationship of Solar Two project to the Sunrise Power Link project. What is the need for Sunrise? Is there available capacity in the Southwest Power Link project?	Project Description
	DT-30	Project Description and Land Use: Concern about the BLM land use amendment and its relationship to the updated resource management plan.	Project Description and Land Use
	DT-31	Socioeconomics: Concern that jobs go to local people and not people brought from outside the community.	Socioeconomics
	DT-32	Project Description: Will project need tax breaks or incentives?	Project Description

Table 3.B: Summary of Verbal Comments Received at the November 24, 2008, and December 18, 2008, Scoping Meetings

Name and Agency of Commenter (transcript pages)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	DT-33	Project Description: Why not build the fabrication factory in the project area?	Project Description
	DT-34	Visual and Aesthetics, and Public Health and Safety: Concern regarding reflection from mirrors on drivers and aircraft.	Visual and Aesthetics, and Public Health and Safety
	DT-35	Project Description: What will the cost of the Solar Two project be to ratepayers?	Project Description
	DT-36	Cumulative Impacts: Concerned about cumulative impacts of various renewable energy projects, on 2.5 million acres of BLM lands.	Cumulative Impacts
Edie Harmon (pp 94–99) (see Note 3)	EH-1	Air Quality: Questions the effect of dust on the mirrors and other moving parts of the Solar Two project.	Air Quality
	EH-2	Project Description: Effects of wind on the project components	Project Description
	EH-3	Project Description: Concern regarding the differences between Sandia, New Mexico and the Imperial Valley; prototype was a smaller scale and in a different type of area.	Project Description
	EH-4	Concern regarding impacts on cultural resources.	Cultural Resources
	EH-5	Project Description: Why isn't the electricity being generated going to nearby land uses or the IID?	Project Description
	EH-6	Project Description: Is this project dependent on the Sunrise Power Link project?	Project Description
	EH-7	Alternatives: Why not alternative sources for San Diego in San Diego: rooftop solar, photovoltaics, distributed electricity?	Alternatives
	EH-8	Project Description and Alternatives: Concerned that industry thinks public lands are a less expensive way of getting land than using fallowed farmlands, abandoned feedlots, areas where the soil is sterile, parking lots, rooftops.	Project Description and Alternatives
	EH-9	Air Quality: Concerns regarding carbon sequestration on the affected lands.	Air Quality
Thomas Topuzes, Co-Chair, MegaRegion Initiative (pp 101 and 102)	TT-1	Supportive of the Solar Two project and the jobs it would provide.	See Note 1
Tim Dubose, Second Vice-President, Building Industry Association, Desert Chapter (pp 102–105)	TD-1	Supportive of the Solar Two project and the jobs it would provide.	See Note 1

Table 3.B: Summary of Verbal Comments Received at the November 24, 2008, and December 18, 2008, Scoping Meetings

Name and Agency of Commenter (transcript pages)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
Verbal Comments Received at the December 18, 2008, Scoping Meeting			
Paul Foley, CURE, Intervener (pp 9, 10, 23–26, 31–33, 41–43, 70, 71, and 102)	--	No comment; introduced himself as a representative of CURE as an intervener for the Solar Two project.	--
	CURE-1	Biological Resources: Questions regarding the jurisdictional delineation provided by the applicant: status, whether it addresses the transmission or water lines off the project site.	Biological Resources
	CURE-2	Project Description: Question regarding the value and disposal of scrap metal when the project is decommissioned.	Project Description
	CURE-3	Water Quality and Project Permits: Will the project have a general or individual storm water permit during construction? Have the appropriate water quality control agencies been contacted regarding the project?	Water Quality and Project Permits
	CURE-4	Air Quality: Questions regarding air quality permit and dust mitigation.	Air Quality
	CURE-5	Project Description and Land Use: Questions regarding parcels that are not part of the project or are immediately adjacent to the project site and how access and other considerations regarding those parcels will be addressed.	Project Description and Land Use
	CURE-6	Comment on the size of the project parcel (10 square miles)	See Note 1
Edie Harmon (pp 71–88, 122, 123, 140–148, and 156–158)	--	No comment; acknowledged his presence as a representative of CURE as an intervener for the Solar Two project (during the second half of the meeting).	--
	EH-10	Water Use/Supply: Questioned the amount of water that would be stored on site and the issue of evaporation.	Water Use
	EH-11	Question regarding effects of high total dissolved solids (TDS) in area groundwater.	Water Quality
	EH-12	Project Description and Water Use: Question regarding which aquifer water will come from.	Project Description and Water Use
	EH-13	Biological Resources: Comment that wastewater ponds should not be attractive to wildlife.	Biological Resources
	EH-14	Project Description and Water Use: Question regarding how much water will be used by project.	Project Description and Water Use
	EH-15	Project Description and Air Quality: Question on whether project roads will be paved; issue of dust generation.	Project Description and Air Quality
EH-16	Project Description: Question regarding frequency of mirror washing.	Project Description	

Table 3.B: Summary of Verbal Comments Received at the November 24, 2008, and December 18, 2008, Scoping Meetings

Name and Agency of Commenter (transcript pages)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	EH-17	Cultural Resources: Concern regarding cultural resources, archaeological sites, historic trails in the area.	Cultural Resources
	EH-18	Cultural Resources: Concern that cultural studies are conducted by persons familiar with the desert and desert cultures.	Cultural Resources
	EH-19	Cultural Resources: Concern that Native American issues be handled appropriately and sensitively.	Cultural Resources
	EH-20	Air Quality and Public Health and Safety: Questions regarding airborne soil fungi and potential effects on prisoners at the State Prison and as a general public health issue.	Air Quality and Public Health and Safety
	EH-21	Wants the real estate appraisals to be public.	See Note 1
	EH-22	Alternatives: Look at alternative sites including Mesquite Lake, which is zoned for industrial uses.	Alternatives
	EH-23	Alternatives: Look at an alternative site that is already disturbed, such as for agriculture or feedlots.	Alternatives
	EH-24	Cumulative Impacts: Look at cumulative impacts of all solar projects on BLM lands.	Cumulative Impacts
	EH-25	Alternatives: Look at in-base and solar rooftop alternatives.	Alternatives
	EH-26	Air Quality and Socioeconomics: Address climate change and potential effects on demographics in San Diego.	Air Quality and Socioeconomics
	EH-27	Project Description and Alternatives: Disperse units to provide electricity to the prison, schools, hospitals, etc; or to IID; or to meet high daytime demand in the county.	Project Description and Alternatives
	EH-28	Project Description: Concerned that use of public land is solely to ensure profitability of the project.	Project Description
	EH-29	Visual and Aesthetics: Assess visual resources impacts consistent with the BLM Visual Resources Management guidelines.	Visual and Aesthetics
	EH-30	Project Description and Land Use: Concern on how the plan amendment will be done.	Project Description and Land Use
	EH-31	Project Description: Will sources of funding include federal funding for a private profit-making company?	Project Description
	EH-32	Project Description: Comments from Dr. Butler on the downtime for the dishes.	Project Description

Table 3.B: Summary of Verbal Comments Received at the November 24, 2008, and December 18, 2008, Scoping Meetings

Name and Agency of Commenter (transcript pages)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	EH-33	Project Description: Concerns regarding the reliability of the process and the ability to provide the number of solar dishes proposed for this and other projects.	Project Description
	EH-34	Project Description: Concerns about where the engines will be on the site.	Project Description
	EH-35	Project Description and Biological Resources: Concerns about the evaporation of water from the wastewater ponds; does not want the ponds to be attractive to birds.	Project Description and Biological Resources
	EH-36	Biological Resources: Concern regarding invasive plant species.	Biological Resources
	EH-37	Cultural Resources: Wants BLM to work closely with Native Americans.	Cultural Resources
	Donna Tisdale (pp 88, 89, and 48–152) (see Note 2)	DT-37	Concerned that the California Energy Commission (CEC)/BLM should not depend on the Environmental Impact Report (EIR) for U.S. Gypsum because the commenter feels it was inadequate.
DT-38		Concerned that government employees are subject to substantial political pressure.	See Note 1
DT-39		Commented on approval of the Sunrise Power Link project through the community of Boulevard.	See Note 1
DT-40		Project Description: Concerned with winds on the site; will an anemometer be used?	Project Description
DT-41		Cumulative Impacts: Wants cumulative visual impacts addressed, including several projects in the vicinity of the Solar Two project.	Cumulative Impacts
DT-42		Project Description: Concerned that project is in early phases without details on funding and manufacturing of the project components.	Project Description
DT-43		Project Description: Concern about whether there is sufficient capacity in the Sunrise Power Link project for the Solar Two project and other projects in line or proposed.	Project Description
Teri Weiner, Desert Protective Council (DPC) (pp 89–94, 123, and 137–139) (see Note 2)		DPC-1	Project Description: Questions regarding how the Solar Two energy generation process works.
	DPC-2	Biological Resources: Concerned regarding effects on the burrowing owl.	Biological Resources
	DPC-3	Biological Resource: Concerned regarding effects on the flat-tailed horned lizard.	Biological Resources
	DPC-4	Biological Resources and Project Permits: Question regarding need for a Streambed Alteration Agreement from the California Department of Fish and Game.	Biological Resources and Project Permits

Table 3.B: Summary of Verbal Comments Received at the November 24, 2008, and December 18, 2008, Scoping Meetings

Name and Agency of Commenter (transcript pages)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
	DPC-5	Project Description: When would construction start? After the environmental process?	Project Description
	DPC-6	Project Description and Land Use: Question on when the draft land use amendment would be released.	Project Description and Land Use
	DPC-7	Requests an economic analysis comparing the Solar Two project with other renewable energy projects such as rooftop solar.	See Note 1
	DPC-8	Alternatives: Concern regarding use of public lands for so many projects, including renewable energy such as the Solar Two project, when there are alternative areas where those projects could be located.	Alternatives
	DPC-9	Visual and Aesthetics: Importance of visual resources in the desert.	Visual and Aesthetics
	DPC-10	Socioeconomics: What are the economic impacts of the project?	Socioeconomics
	DPC-11	Public Health and Safety: Concern regarding glare from mirrors to aircraft.	Public Health and Safety
	DPC-12	Cultural Resources: Engage Native American leaders to provide input on the cultural integrity of the area.	Cultural Resources
	DPC-13	Water Use: Concern regarding the demand for water to wash the mirrors.	Water Use
Marilyn Moskowitz (pp 152–154) (see Note 2)	MM-6	Air Quality and Public Health and Safety: Concerned regarding air quality in the area and health effects such as asthma.	Air Quality and Public Health and Safety
	MM-7	Water Sources and Use: Concerned regarding using drinking quality water from the aquifer.	Water Use
	MM-8	Alternatives: An alternative to Solar Two would be rooftop solar.	Alternatives
	MM-9	Project Description: Concerned about technological obsolescence of the project and who will be financially responsible at that point. Wants a large bond posted for cleanup and restoration of the site.	Project Description
	MM-10	Alternatives: Shift from large mega stations to decentralized, localized, and alternative sources.	Alternatives

Table 3.B: Summary of Verbal Comments Received at the November 24, 2008, and December 18, 2008, Scoping Meetings

Name and Agency of Commenter (transcript pages)	Comment Number	Summary of Comments by Environmental Parameter or Topic	Where the Comments will be Addressed in the Environmental Document
Steve Taylor, SDG&E (pp 155 and 156)	ST-2	Supportive of the Solar Two project	See Note 1

NOTE 1: This comment does not raise an issue under the National Environmental Policy Act (NEPA) or the California Environmental Quality Act (CEQA) relative to the proposed Solar Two project. All comments describing support for or opposition to the proposed project or asking for analyses not required under CEQA and NEPA will be considered by the decision-makers at the United States Department of the Interior, Bureau of Land Management (BLM) and the California Energy Commission (CEC).

NOTE 2: This commenter also provided written comments to the CEC. Refer to Table 3.A for a summary of those comments. Comments from these parties are numbered consecutively, including the written comments in Table 3.A and the verbal comments in Table 3.B.

NOTE 3: Ms. Harmon also provided written comments to the CEC, as summarized in Table 3.A, as a representative of the Sierra Club, San Diego Chapter. Ms. Harmon did not indicate that she was commenting on behalf of the Sierra Club in her verbal comments provided at the two scoping meetings. Therefore, her comments at the scoping meeting are numbered as comments from an individual and separately from her comments as a representative of the Sierra Club.

NOTE 4: Mr. Trafecanty also provided written comments to the CEC, as summarized in Table 3.A, as an individual. In those written comments, Mr. Trafecanty did not indicate that he was commenting on behalf of the Protect Our Communities Fund (POCF) as he did in his verbal comments at the November 24, 2008, scoping meeting. Therefore, his verbal comments at the scoping meeting are numbered as comments from Mr. Trafecanty as a representative of POCF and separately from his written comments to the CEC as an individual.

APPENDIX A
NOTICE OF INTENT

DEPARTMENT OF THE INTERIOR**Bureau of Land Management**

[CACA 47740, LLCAD07000 L51030000]

Notice of Intent To Prepare an Environmental Impact Statement/Staff Assessment and Proposed Land Use Plan Amendment for the Proposed SES Solar Two Project, Imperial County, CA

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice.

SUMMARY: In compliance with the National Environmental Policy Act of 1969, as amended (NEPA), and the California Environmental Quality Act (CEQA), the Department of the Interior, Bureau of Land Management (BLM), together with the California Energy Commission (Energy Commission), (hereinafter jointly referred to as the Agencies) intend to prepare an Environmental Impact Statement/Staff Assessment (EIS/SA), and a Proposed Land Use Plan Amendment, for the Stirling Energy Systems (SES) Solar Two Project (Project), a Stirling engine systems solar dish project in Imperial County, California. SES is seeking approval to construct and operate an electrical generating facility with a nominal capacity of 750 megawatts (MW), using concentrated solar thermal power. The approximately 6,500 acres of land needed to develop the Project consists of approximately 6,140 acres of BLM administered public land and approximately 360 acres of privately owned land.

SES has submitted an application to the BLM requesting a right-of-way (ROW) to construct the Project and related facilities. Pursuant to the California Desert Conservation Area (CDCA) Plan (1980, as amended), sites associated with power generation or transmission not identified in the CDCA Plan will be considered through the plan amendment process.

Under Federal law, BLM is responsible for processing requests for rights-of-way to authorize such proposed projects and associated transmission lines and other appurtenant facilities on land it manages. BLM must comply with the requirements of NEPA to ensure that environmental impacts associated with construction, operation, and decommissioning will be identified, analyzed and considered in the application process. In the case of solar thermal power plant projects, this will be accomplished through coordination of the state and federal application

processes, public participation, environmental analysis, and the preparation of Draft and Final Environmental Impact Statement (EIS) in coordination with the Energy Commission and its Preliminary and Final Staff Assessments.

Under California law, the Energy Commission is responsible for reviewing the applications for certification filed for thermal power plants over 50 MW, and also has the role of lead agency for the environmental review of such projects under the CEQA (Public Resources Code, section 25500 *et seq.*; and Public Resources Code, section 21000 *et seq.*) The Energy Commission conducts this review in accordance with the administrative adjudication provisions of the Administrative Procedure Act (Gov. Code, section 11400 *et seq.*) and its own regulations governing site certification proceedings (Cal. Code Regs., tit. 20, section 1701 *et seq.*), which have been deemed CEQA equivalent by the Secretary of Resources. SES Solar Two, LLC has submitted an Application for Certification (AFC) to the Energy Commission. The AFC facilitates analysis and review by staff prior to an Energy Commission decision.

DATES: Publication of this notice initiates a public scoping period of at least 30 days. During the public scoping period, the Agencies will solicit public comments on issues, concerns, potential impacts, alternatives, and mitigation measures that should be considered in the analysis of the proposed action. In addition, the Agencies expect to hold at least one public meeting/workshop during the scoping period to encourage public input. The public meeting(s) will be announced through the local news media, newspapers, mailings, the BLM Web page (<http://www.ca.blm.gov/elcentro>) and the Energy Commission Web page (<http://www.energy.ca.gov/sitingcases/solartwo/>) at least 15 days prior to the event. While you may have the opportunity to make oral comments, comments must also be submitted in writing. In order to be included in the Draft EIS/Preliminary Staff Assessment (DEIS/PSA), all comments must be received prior to the close of the scoping period or 15 days after the last public meeting, whichever is later. Additional opportunities for public participation and formal comment occur when the DEIS/PSA is issued.

ADDRESSES: You may submit comments in a variety of ways: (1) By U.S. mail, (2) by electronic mail, (3) or by attending the public scoping meeting(s)

and submitting written comments at the meeting(s).

By Mail: Please use first-class postage and be sure to include your name and a return address. Please send written comment to: Christopher Meyer, Project Manager, Systems Assessment & Facility Siting Division, California Energy Commission, 1516 Ninth Street, MS-15, Sacramento, CA 95814.

By Electronic Mail: E-mail comments are welcome; however, please remember to include your name and return address in the e-mail message. E-mail messages should be sent to CMeyer@energy.state.ca.us.

Before including your address, phone number, e-mail address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

FOR FURTHER INFORMATION CONTACT:

Information regarding the BLM process may be obtained from the Bureau of Land Management, 1661 So. 4th Street, El Centro, 92243, attention Lynda Kastoll, (760) 337-4421, lynda_kastoll@ca.blm.gov; or Erin Dreyfuss, (760) 337-4436, erin_dreyfuss@ca.blm.gov. Information regarding the Energy Commission process may be obtained from Christopher Meyer, Project Manager, Systems Assessment & Facility Siting Division, California Energy Commission, 1516 Ninth Street, MS-15, Sacramento, CA 95814, (916) 653-1639, CMeyer@energy.state.ca.us. Information on participating in the Commission's review of the project may be obtained through the Commission's Public Adviser's Office, at (916) 654-4489 or toll free in California, (800) 822-6228, or by email at PublicAdviser@energy.state.ca.us. News media inquiries should be directed to the Commission's media office at (916) 654-4989, or via email at mediaoffice@energy.state.ca.us.

Status of the proposed project, copies of notices, an electronic version of the AFC, and other relevant documents are also available on the Commission's internet Web site at <http://www.energy.ca.gov/sitingcases/solartwo>. You can also subscribe to receive e-mail notification of all notices at <http://www.energy.ca.gov/listservers>.

SUPPLEMENTARY INFORMATION: SES Solar Two, LLC has applied to BLM for a right-of-way on public lands to

construct a concentrated solar thermal power plant facility approximately 14 miles west of El Centro, CA, in Imperial County. The project site is just south of Plaster City between the Union Pacific Railroad tracks and the Interstate 8 highway. The facility is expected to operate for approximately 30 years. The proposed project would utilize SunCatcher technology, consisting of approximately 30,000 25-kilowatt solar power dishes with a generating capacity of approximately 750 megawatts (MW) to be built in two phases. The first phase would consist up to 12,000 SunCatchers configured in 200 1.5 MW solar groups of 60 SunCatchers per group and have a net nominal generating capacity of 300 MW. The second phase would consist of approximately 18,000 SunCatchers configured in 500 1.5 MW groups with a net generating capacity of 450 MW. Each SunCatcher system consists of an approximate 38-foot high by 40-foot wide solar concentrator dish that supports an array of curved glass mirror facets designed to automatically track the sun and focus solar energy onto a Power Conversion Unit which generates electricity. Related structures would include a main services complex, assembly buildings, a 230-kilovolts (kV) electrical substation, a 10-mile transmission line, access roads, supply water line, and a 10-mile double circuit 230kV transmission line from the project site to San Diego Gas and Electric's existing Imperial Valley electrical substation interconnecting the project to the existing 500 kV transmission system. The 450-MW Phase II is dependent on the approval of the proposed Sunrise Powerlink 500kV transmission line that would also interconnect with the Imperial Valley electrical substation. The EIS/SA will analyze the site-specific impacts on air quality, biological resources, cultural resources, water resources, geological resources and hazards, hazardous materials handling, land use, noise, paleontological resources, public health, socioeconomics, soils, traffic and transportation, visual resources, waste management and worker safety and fire protection, as well as facility design engineering, efficiency, reliability, transmission system engineering and transmission line safety and nuisance. The CDCA Plan, while recognizing the potential compatibility of solar generation facilities on public lands, requires that all sites associated with power generation or transmission not identified in the Plan will be considered through the Plan Amendment process.

The following Planning Criteria will be utilized during the plan amendment process:

- The plan amendment process will be completed in compliance with FLPMA, NEPA, and all other relevant Federal law, Executive orders, and management policies of the BLM;
- The plan amendment process will include an EIS that will comply with NEPA standards;
- Where existing planning decisions are still valid, those decisions may remain unchanged and be incorporated into the new plan amendment;
- The plan amendment will recognize valid existing rights;
- Native American Tribal consultations will be conducted in accordance with policy and Tribal concerns will be given due consideration. The plan amendment process will include the consideration of any impacts on Indian trust assets;
- Consultation with the SHPO will be conducted throughout the plan amendment process; and
- Consultation with USFWS will be conducted throughout the plan amendment process.

If the ROW and proposed land use plan amendment are approved by BLM, the concentrated solar thermal power plant facility on public lands would be authorized in accordance with Title V of the Federal Land Policy and Management Act of 1976 and the Federal Regulations at 43 CFR part 2800.

A certificate designating approval of the Energy Commission must be obtained by SES before it may construct a power plant and/or electric transmission line and related facilities.

Dated: October 10, 2008.

Thomas Pogacnik,

Deputy State Director, Natural Resources (CA-930), California State Office.

Bureau of Land Management

[WY-060-1320-EL, WY-060-5110-GA-CK33, WY-060-5110-GA-CK36, WY-060-5110-GA-CK35, WYW161248, WYW172585, WYW172657, WYW173360]

Notice of Availability and Notice of Hearing for the South Gillette Area Coal Draft Environmental Impact Statement That Includes Four Federal Coal Lease by Applications, Wyoming

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice of Availability.

SUMMARY: In accordance with the National Environmental Policy Act of 1969 (NEPA, 42 U.S.C. 4321 *et seq.*) and the Federal Land Policy and Management Act of 1976 (FLPMA, 43 U.S.C. 1701 *et seq.*), the Bureau of Land Management (BLM) has prepared a Draft Environmental Impact Statement (DEIS) for the South Gillette Area Coal project that contains four Federal Coal Lease By Applications (LBAs), and by this Notice is announcing a public hearing requesting comments on the DEIS, Maximum Economic Recovery (MER), and Fair Market Value (FMV) pursuant to 43 Code of Federal Regulations (CFR) 3425.4.

DATES: To ensure comments will be considered, the BLM must receive written comments on the South Gillette Area Coal DEIS, MER, and FMV within 60 days following the date the Environmental Protection Agency publishes the Notice of Availability in the *Federal Register*. The public hearing will be held at 7 p.m. MST, on November 19, 2008, at the Campbell County George Amos Memorial Building, 412 South Gillette Avenue, Gillette, Wyoming.

ADDRESSES: You may submit comments by any of the following methods:

- *E-mail:* casper_wymail@blm.gov.
- *Fax:* 307-261-7587.
- *Mail:* Casper Field Office, Bureau of Land Management, Attn: Teresa Johnson, 2987 Prospector Drive, Casper, Wyoming 82604.

Copies of the DEIS are available at the following BLM office locations: BLM Wyoming State Office, 5353 Yellowstone Road, Cheyenne, Wyoming 82009; and BLM Casper Field Office, 2987 Prospector Lane, Casper, Wyoming 82604. The DEIS is available electronically on the following Web site: http://www.blm.gov/wy/st/en/info/NEPA/cfdocs/south_gillette.html.

FOR FURTHER INFORMATION CONTACT:

Teresa Johnson or Mike Karbs at the above address, or telephone: 307-261-7600.

SUPPLEMENTARY INFORMATION: The DEIS analyzes the potential impacts for Federal Coal LBAs serialized as WYW161248, WYW172585, WYW172657, and WYW173360 and referred to as the Belle Ayr North, West Coal Creek, Caballo West, and Maysdorf II tracts, in the decertified Powder River Federal Coal Production Region, Wyoming. The BLM is considering issuing these four coal leases as a result of four applications filed between July of 2004 and September of 2006. **SUPPLEMENTARY INFORMATION** by application is as follows.

APPENDIX B

OCTOBER 17, 2008, BLM NEWS RELEASE

U.S. Department of the Interior
Bureau of Land Management
News Release

For Immediate Release: October 17, 2008

Contacts: Stephen Razo 951-697-5217 srazo@ca.blm.gov

Environmental Review Process Begins for Solar Project in Imperial County

The U.S. Bureau of Land Management (BLM), together with the California Energy Commission (CEC), today published a notice announcing that the agencies intend to prepare an Environmental Impact Statement/Staff Assessment (EIS/SA) for the Stirling Energy Systems' Solar Two Project in Imperial County.

The project, to be located about 14 miles west of El Centro, involves about 6,500 acres, including 6,140 acres of BLM public lands and 360 acres of private lands. The project site is just south of Plaster City between the Union Pacific Railroad and Interstate 8. Stirling has submitted an application to BLM requesting a right-of-way to construct and operate an electric generating facility using concentrated solar thermal power to generate at least 750 megawatts of power, enough to meet the needs of 750,000 people.

BLM El Centro Field Manager Vicki Wood said the publication of the notice in the Federal Register initiates a 30-day public scoping period, during which the public can submit comments on issues to be addressed in the EIS/SA. Under California law, CEC is responsible for thermal power plants over 50 megawatts and is the lead agency under the California Environmental Quality Act. BLM is the lead agency under the federal National Environmental Policy Act.

Wood said the agencies expect to hold at least one public meeting at a time and date to be announced shortly. She also explained that the proposed project will require an amendment to the California Desert Conservation Area Plan. According to Stirling's application, the proposed project would be built in two phases, and ultimately consist of 30,000 25-kilowatt power dishes utilizing "Suncatcher" technology consisting of a solar concentrator dish approximately 38-feet high by 40-feet wide. Related structures include transmission lines, access roads, water lines, and other facilities.

Comments should be sent to Christopher Meyer, Project Manager/CEC, 1516 Ninth Street, MS-15, Sacramento, CA 95814, CMeyer@energy.state.ca.us Further information can be obtained from Meyer and Lynda Kastoll, BLM, 1661 So. 4th St., El Centro, CA 92243 (760) 337-4421, Lynda_Kastoll@ca.blm.gov Agencies websites also contain information on the project: <http://222.energy.ca.gov/sitingcases/solartwo/> and <http://www.ca.blm.gov/elcentro>

Notice of BLM and Energy Commission Staff Data Response and Issues Resolution Workshop / Scoping Meeting for the SES Solar Two Project (08-AFC-5)

The Bureau of Land Management (BLM) and the California Energy Commission (Energy Commission) will conduct a data response and issues resolution workshop/BLM scoping meeting for the Stirling Energy Systems Solar Two Project (SES Solar Two) on December 18, 2008. The purpose of the workshop is to discuss Stirling Energy Systems Solar Two, LLC's responses to the BLM and Energy Commission staff's data requests and issues identified in the November 17, 2008 Issues Identification Report. The workshop will also function as a second scoping meeting for the BLM Right-of-Way Application CACA-47740. All interested agencies and members of the public are invited to participate. The workshop/scoping meeting will be held:

Thursday, December 18, 2008
1:00 p.m. – 4:00 p.m. Workshop
4:00 p.m. – 5:00 p.m. Break (time permitting)
5:00 p.m. – 7:00 p.m. Public Comments/BLM Scoping

**Imperial County
County Administration Building
Board Chambers
940 Main Street
El Centro, CA 92243
(Map Attached)**

Purpose

The BLM and Energy Commission are currently reviewing Stirling Energy Systems Solar Two, LLC's (SES Solar Two, LLC's) Application for Certification for the proposed development of the SES Solar Two Project. To facilitate its review of the joint Application for Certification and Environmental Impact Statement process, the BLM and Energy Commission staff published the first set of joint data requests for the following technical areas on November 14, 2008: biological resources, land use, socioeconomics, soil and water resources, traffic and transportation, transmission system engineering, visual resources, waste management, and worker safety/fire protection. Additional data requests will be issued for the technical areas of air quality and cultural resources on December 2, 2008.

Project Description

The proposed project would utilize SunCatcher technology, consisting of approximately 30,000 25-kilowatt solar power dishes with a generating capacity of approximately 750 megawatts (MW) to be built in two phases. The first phase would consist up to 12,000 SunCatchers configured in 200 1.5 MW solar groups of 60 SunCatchers per group and have a net nominal generating capacity of 300 MW. The second phase would consist of approximately 18,000 SunCatchers configured in 500 1.5 MW groups with a net generating capacity of 450 MW. Each SunCatcher system consists of an approximate 38-foot high by 40-foot wide solar concentrator dish that supports an array of curved glass mirror facets designed to automatically track the sun and focus solar energy onto a Power Conversion Unit which generates electricity. Related structures would include a main services complex, assembly buildings, a 230-kilovolt (kV) electrical substation, access roads, supply water line, and a 10-mile double circuit 230-kV transmission line from the project site to San Diego Gas and Electric's existing Imperial Valley electrical substation interconnecting the project to the existing 500-kV transmission system. The 450 MW Phase II is dependent on the approval of the proposed Sunrise Powerlink 500-kV transmission line that would also interconnect with the Imperial Valley electrical substation.

Background

On October 8, 2008, the Energy Commission began review of the project. During the review period, Energy Commission staff will determine whether the proposed project complies with applicable laws related to public health and safety, environmental impacts, and engineering requirements. As the lead agency under the California Environmental Quality Act (CEQA), the Energy Commission is responsible for reviewing and ultimately approving or denying all applications to construct and operate thermal electric power plants, 50 MW and greater, in California. The Energy Commission facility certification process carefully examines public health and safety, environmental impacts and engineering aspects of proposed power plants and all related facilities such as electric transmission lines and natural gas and water pipelines.

Under federal law, the BLM is responsible for processing applications for rights-of-way to authorize the proposed project and associated transmission lines and other facilities to be constructed and operated on land it manages. In processing applications, the BLM must comply with the requirements of the National Environmental Policy Act (NEPA), which requires that federal agencies consider the environmental impacts associated with the projects they approve.

The purpose of the BLM action is to provide the applicant a decision in processing its application for a right-of-way (ROW) grant for legal use and access of the public lands in Imperial County, California managed by the BLM. The need for BLM action is established by the BLM's responsibility under the Federal Land Policy and Management Act (FLPMA), NEPA and other federal laws to respond to SES's request for a ROW for legal

access to construct, operate and decommission a proposed concentrated solar thermal generation plant and related facilities on the public lands. For the decision to be made, BLM will decide whether or not to grant a ROW, and if so, under what terms and conditions.

The proposal would also create the need for amending the BLM California Desert Conservation Plan 1980 (CDCP). The purpose of the CDCP amendment is to ensure the public lands are managed through land use planning according to the principles of multiple use identified in FLPMA while managing valid existing rights and other obligations established. The proposed amendment is necessary to address changing resource demands and technological development proposals on public lands. The CDCP as amended requires (page 95) that "Sites associated with power generation or transmission not identified in the Plan (as is this case) will be considered through the Plan Amendment process."

Pursuant to a Memorandum of Understanding (MOU), the BLM and the Energy Commission staff intend to conduct a joint environmental review of the SES Solar Two Project in a NEPA/ CEQA process. It is in the interest of the BLM and the Energy Commission to share in the preparation of a joint environmental analysis of the proposed project to avoid duplication of staff efforts, to share staff expertise and information, to promote intergovernmental coordination at the local, state, and federal levels, and to facilitate public review by providing a joint document and a more efficient environmental review process.

Public Participation

The Energy Commission's Public Adviser's Office provides the public with assistance in participating in Commission activities. If you want information on how to participate in this proceeding, please contact the Associate Public Adviser, Loreen McMahon, at: (916) 654-4489, toll free at (800) 822-6228, by FAX at (916) 654-4493, or by e-mail at public.adviser@energy.state.ca.us If you have a disability and require assistance to participate, please contact Lourdes Quiroz at lquiroz@energy.state.ca.us or at (916) 654-5146 at least five days in advance of the workshop. Spanish translation services will be available at the workshop.

Questions

General information about the proposed generating facility and related documents are available on the Energy Commission's website at:

<http://www.energy.ca.gov/sitingcases/solartwo/index.html>

or the BLM's website at: <http://www.blm.gov/ca/st/en/fo/elcentro/nepa/stirling.html>.

Please direct all news media inquiries to the Energy Commission's media office at (916) 654-4989 or e-mail at mediaoffice@energy.state.ca.us. For technical questions on the subject matter, please contact Christopher Meyer, the Energy Commission Project Manager, at (916) 653-1639 or by e-mail at: cmeyer@energy.state.ca.us or Jim Stobaugh, the BLM Project Manager, at (775) 861-6478 or by e-mail at: jim_stobaugh@blm.gov. If you are unable to attend the workshop, written comments may be sent to the Energy Commission Project Manager electronically or to the Energy Commission's street address shown on the letterhead of this notice by January 2, 2009, the end of the BLM scoping period.

**Aviso del personal de la Oficina de Administración de
Tierras y la Comisión de Energía
Taller de respuesta de información y solución de
problemas / Reunión para tratar el alcance del proyecto
SES Solar Two Project
(08-AFC-5)**

La Oficina de Administración de Tierras (BLM, Bureau of Land Management) y la Comisión de Energía de California (Comisión de Energía), realizarán un taller de respuesta de información y solución de problemas y una reunión de la Oficina de Administración de Tierras, para tratar el alcance del proyecto Stirling Energy Systems Solar Two Project (SES Solar Two) el 18 de diciembre de 2008. La finalidad del taller es analizar las respuestas de Stirling Energy Systems Solar Two, LLC a las solicitudes de información realizadas por el personal de la Oficina de Administración de Tierras y la Comisión de Energía y los problemas identificados en el Informe de identificación de problemas, del 17 de noviembre de 2008. El taller también funcionará como una segunda reunión para tratar el alcance del proyecto de solicitud de derecho de paso CACA-47740 a la Oficina de Administración de Tierras. Se invita a participar a todos los organismos y miembros del público interesados. El taller y la reunión para tratar el alcance del proyecto se realizarán el:

Jueves 18 de diciembre de 2008

1:00 p.m. a 4:00 p.m. Taller

4:00 p.m. a 5:00 p.m. Descanso (si hay tiempo)

**5:00 p.m. a 7:00 p.m. Comentarios públicos/Reunión de la Oficina de
Administración de Tierras para tratar el alcance del proyecto**

**Condado de El Centro
Edificio de Administración del Condado
Sala del Consejo
940 Main Street
El Centro, CA 92243
(mapa adjunto)**

Propósito

La Oficina de Administración de Tierras y la Comisión de Energía se encuentran actualmente revisando la solicitud de certificación de Stirling Energy Systems Solar Two, LLC (SES Solar Two, LLC) para el desarrollo propuesto del proyecto SES Solar Two Project. Para facilitar la revisión del proceso conjunto de solicitud de certificación y declaración de impacto ambiental, el personal de la Oficina de Administración de Tierras

y la Comisión de Energía publicó el primer conjunto de solicitudes de información conjuntas para las siguientes áreas técnicas, el 14 de noviembre de 2008: recursos biológicos, uso del suelo, aspectos socioeconómicos, recursos del suelo y el agua, tráfico y transporte, ingeniería de sistemas de transmisión, recursos visuales, gestión de residuos y seguridad de los trabajadores y protección contra incendios. El 2 de diciembre de 2008 se publicarán solicitudes de información adicionales para las áreas técnicas de calidad del aire y recursos culturales.

Descripción del proyecto

El proyecto propuesto utilizaría tecnología de SunCatcher, que consta de aproximadamente 30,000 paneles de energía solar de 25 kilowatts con una capacidad de generación de electricidad de aproximadamente 750 megawatts (MW), que se armarían en dos fases. La primera fase constaría de un máximo de 12,000 SunCatchers, configurados en 200 grupos solares de 1.5 MW, compuestos por 60 SunCatchers por grupo y con una capacidad de generación de electricidad neta de 300 MW. La segunda fase constaría de aproximadamente 18,000 SunCatchers, configurados en 500 grupos de 1.5 MW, con una capacidad de generación de electricidad neta de 450 MW. Cada sistema SunCatcher consta de un panel concentrador solar de aproximadamente 38 pies de alto y 40 pies de ancho, que acepta una variedad de facetas de espejos curvos diseñados para seguir automáticamente al sol y concentrar la energía solar en una unidad de conversión de energía que genera electricidad. Las estructuras relacionadas incluirían un complejo de servicios principales, estructuras de ensamblaje, una subestación eléctrica de 230 kilovoltios (kV), una línea de transmisión de 10 millas, caminos de acceso, línea de suministro de agua y una línea de transmisión de doble circuito de 230 kV que recorre 10 millas, desde el emplazamiento del proyecto hasta la subestación eléctrica de San Diego Gas and Electric existente en Imperial Valley, la cual interconecta el proyecto al sistema de transmisión de 500 kV existente. La fase II de 450 MW depende de la aprobación de la línea de transmisión Sunrise Powerlink de 500 kV propuesta, que también se interconectaría con la subestación eléctrica de Imperial Valley.

Antecedentes

El 8 de octubre de 2008, la Comisión de Energía comenzó la revisión del proyecto, proceso que tomará aproximadamente 18 meses. Durante el período de revisión, el personal de la Comisión de Energía determinará si el proyecto propuesto cumple con las leyes pertinentes relacionadas con la salud y la seguridad públicas, los impactos ambientales y los requisitos de ingeniería. Como la agencia líder según la Ley de calidad ambiental de California (CEQA, por sus siglas en inglés), la Comisión de Energía es responsable de la revisión y aprobación o denegación final de todas las solicitudes para construir y operar plantas termoeléctricas de 50 MW y más en California. El proceso de certificación de las instalaciones por parte de la Comisión de Energía analiza cuidadosamente la salud y seguridad públicas, los impactos ambientales y los aspectos de ingeniería de las plantas de energía y todas las instalaciones relacionadas propuestas, tales como líneas de transmisión eléctrica y tuberías de gas natural y de agua.

Según la ley federal, la Oficina de Administración de Tierras es responsable de procesar las solicitudes de derecho de paso para autorizar el proyecto y las líneas de transmisión

asociadas propuestos, además de otras instalaciones que se construirán y operarán en terrenos que ésta administra. Al procesar las solicitudes, la Oficina de Administración de Tierras debe cumplir los requisitos de la Ley nacional de política ambiental (NEPA, por sus siglas en inglés), lo cual requiere que los organismos federales consideren los impactos ambientales asociados con los proyectos que aprueban.

El propósito de la medida de la Oficina de Administración de Tierras es brindar una decisión al postulante al procesar su solicitud de una concesión de derecho de paso (ROW, por sus siglas en inglés) para uso y acceso legal a los terrenos públicos en el condado de Imperial, California, administrados por la Oficina de Administración de Tierras. La necesidad de la medida de la Oficina de Administración de Tierras es establecida por la responsabilidad de ésta, según la Ley federal de políticas y administración de tierras (FLPMA, por sus siglas en inglés), la Ley nacional de política ambiental y otras leyes federales para responder a la solicitud de SES de derecho a paso para tener acceso legal para construir, operar y decomisar una planta de generación térmica solar e instalaciones relacionadas propuestas en los terrenos públicos. Para tomar la decisión, la Oficina de Administración de Tierras decidirá si conceder o no un derecho de paso y, de hacerlo, bajo qué términos y condiciones.

La propuesta crearía también la necesidad de modificar el Plan de conservación del desierto de California (CDCP, por sus siglas en inglés) de 1980, de la Oficina de Administración de Tierras. El propósito de la modificación del Plan de conservación del desierto de California es garantizar que los terrenos públicos se administren a través de la planificación del uso de terreno de acuerdo con los principios de uso múltiple identificados en la Ley federal de políticas y administración de tierras, a la vez que se administran los derechos válidos existentes y otras obligaciones establecidas. La modificación propuesta es necesaria para abordar las cambiantes demandas de recursos y las propuestas de desarrollo tecnológico en terrenos públicos. Según la modificación, la Ley de conservación del desierto de California exige (página 95) que "Los sitios asociados con generación o transmisión de energía no identificados en el Plan (como en este caso) se considerarán a través del proceso de modificación del Plan".

En conformidad con un Protocolo de comprensión (MOU, por sus siglas en inglés), el personal de la Oficina de Administración de Tierras y la Comisión de Energía pretende realizar una revisión ambiental conjunta del proyecto SES Solar Two Project en un proceso de la Ley nacional de política ambiental y la Ley de calidad ambiental de California. El interés de la Oficina de Administración de Tierras y la Comisión de Energía es compartir en la preparación de un análisis ambiental conjunto del proyecto propuesto para evitar doblar los esfuerzos del personal, compartir la experiencia e información del personal, promover la coordinación intergubernamental a nivel local, estatal y federal, así como facilitar las revisiones públicas al proporcionar un documento conjunto y un proceso de revisión ambiental más eficiente.

Participación pública

La Oficina del Asesor Público de la Comisión de Energía invita al público a participar en las actividades de la Comisión. Si desea información sobre cómo participar en este procedimiento, comuníquese con la asesora pública asociada, Loreen McMahon, al: (916) 654-4489, sin costo al (800) 822-6228, por FAX al (916) 654-4493, o por correo electrónico a public.adviser@energy.state.ca.us. Si tiene una discapacidad y necesita ayuda para participar, comuníquese con Lourdes Quiroz a lquiroz@energy.state.ca.us o al (916) 654-5146 al menos cinco días antes del taller. En el taller habrá servicios de traducción al español disponibles.

Preguntas

La información general sobre la instalación de generación de energía eléctrica propuesta y los documentos relacionados se encuentran disponibles en el sitio Web de la Comisión de Energía, en: <http://www.energy.ca.gov/sitingcases/solartwo/index.html> o el sitio Web de la Oficina de Administración de Tierras en: <http://www.blm.gov/ca/st/en/fo/elcentro/nepa/stirling.html>.

Dirija todas las preguntas de los medios de comunicación a la Oficina de Medios de Comunicación de la Comisión de Energía al (916) 654-4989 o por correo electrónico a mediaoffice@energy.state.ca.us. Para realizar preguntas técnicas sobre el tema, comuníquese con Christopher Meyer, gerente de proyecto de la Comisión de Energía, al (916) 653-1639 o por correo electrónico a: cmeyer@energy.state.ca.us o con Jim Stobaugh, gerente de proyecto de la Oficina de Administración de Tierras, al (775) 861-6478 o por correo electrónico a: jim_stobaugh@blm.gov. Si no puede asistir al taller, puede enviar sus comentarios escritos por vía electrónica al gerente de proyecto de la Comisión de Energía o a la dirección postal de la Comisión de Energía que figura en el membrete de este Aviso, antes del 2 de enero de 2009, el fin del período de alcance de la Oficina de Administración de Tierras.

APPLICATION FOR CERTIFICATION FOR THE
SOLAR TWO POWER PROJECT
STIRLING ENERGY SYSTEMS

DOCKET NO. 08-AFC-5

**NOTICE OF INFORMATIONAL HEARING AND PUBLIC SITE VISIT
AND
BUREAU OF LAND MANAGEMENT SCOPING MEETING**

On June 30, 2008, Stirling Energy Systems (SES) Solar Two, LLC (Applicant), submitted an Application for Certification (AFC) to the Energy Commission to construct a concentrated solar thermal power plant facility approximately 14 miles west of El Centro, in Imperial County. The project site is just south of Plaster City between the Union Pacific Railroad tracks and the Interstate 8 Highway. The Energy Commission has exclusive state-level jurisdiction to license this project and is considering the proposal under a twelve-month review process established by Public Resources Code section 25540.6. The Bureau of Land Management (BLM) is conducting its own concurrent process to determine whether to approve an amendment to the 1980 California Desert Conservation Area Plan and a right-of-way grant authorizing the construction and operation of the proposed project on federal lands.

PLEASE TAKE NOTICE that the Energy Commission has designated a Committee of two commissioners to conduct proceedings on the Application. The Committee has scheduled a public Informational Hearing and Site Visit to discuss the proposed Project and the BLM will conduct a Public Scoping Meeting as described below:

Monday, November 24, 2008

Public Informational/Scoping Meeting begins at 2:00 p.m.

Site Visit begins (bus leaves) at 3:30 p.m.

Imperial County Administration Center

Board Chambers

940 West Main Street, Suite 211

El Centro, California 92243

(Map to Location)

After the Informational Hearing/Scoping Meeting, members of the public are invited to join the Committee and the BLM on a tour of the proposed site. The Applicant will provide transportation to and from the site. For reservations, contact the Energy Commission's Public Adviser's Office at (916) 654-4489 or 1-800-822-6228 or e-mail: [\[publicadviser@energy.state.ca.us\]](mailto:publicadviser@energy.state.ca.us). Please make your reservation prior to **Monday, November 17** so that we can assure you a space.

Background

On October 8, 2008, the Energy Commission began review of the Project. During the review period, Energy Commission staff will determine whether the proposed project complies with applicable laws related to public health and safety, environmental impacts, and engineering requirements. This Informational Hearing/Scoping Meeting is co-sponsored by the Energy Commission and BLM to inform the public about the Project and to invite public participation in the review process.

As the lead agency under the California Environmental Quality Act (CEQA), the Energy Commission is responsible for reviewing and ultimately approving or denying all applications to construct and operate thermal electric power plants, 50 MW and greater, in California. The Energy Commission facility certification process carefully examines public health and safety, environmental impacts and engineering aspects of proposed power plants and all related facilities such as electric transmission lines and natural gas and water pipelines.

Under federal law, the BLM is responsible for processing applications for rights-of-way to authorize the proposed project and associated transmission lines and other facilities to be constructed and operated on land it manages. In processing applications, the BLM must comply with the requirements of the National Environmental Policy Act (NEPA), which requires that federal agencies consider the environmental impacts associated with such projects.

Pursuant to a Memorandum of Understanding (MOU), the BLM and the Energy Commission staff intend to conduct a joint environmental review of the SES Solar Two Project in a single NEPA/ CEQA process. It is in the interest of the BLM and the Energy Commission to share in the preparation of a joint environmental analysis of the proposed project to avoid duplication of Staff efforts, to share Staff expertise and information, to promote intergovernmental coordination at the local, state, and federal levels, and to facilitate public review by providing a joint document and a more efficient environmental review process.

Purpose of the Informational/Scoping Hearing

This Informational Hearing/Scoping Meeting provides an opportunity for members of the community in the project vicinity to obtain information, to offer comments and concerns, and then to view the project site. The Applicant will explain plans for developing the Project and the related facilities and Energy Commission staff will explain the

administrative licensing process and Staff's role in reviewing the Application. The BLM staff will also explain the role of their agency in the joint process as is described in **Attachment A** to this Notice—BLM's Notice of Intent to Prepare an Environmental Impact Statement/Staff Assessment.

Project Description

The proposed project would utilize SunCatcher technology, consisting of approximately 30,000 25-kilowatt solar power dishes with a generating capacity of approximately 750 megawatts (MW) to be built in two phases. The first phase would consist up to 12,000 SunCatchers configured in 200 1.5 MW solar groups of 60 SunCatchers per group and have a net nominal generating capacity of 300 MW. The second phase would consist of approximately 18,000 SunCatchers configured in 300 1.5 MW groups with a net generating capacity of 450 MW. Each SunCatcher system consists of an approximate 38-foot high by 40-foot wide solar concentrator dish that supports an array of curved glass mirror facets designed to automatically track the sun and focus solar energy onto a Power Conversion Unit which generates electricity. Related structures would include a main services complex, assembly buildings, a 230-kilovolts (kV) electrical substation, access roads, supply water line, and a 10.3-mile double circuit 230-kV transmission line from the project site to San Diego Gas and Electric's existing Imperial Valley electrical substation. Development of the 450 MW Phase II is dependent on the approval and construction of additional transmission capacity, such as the proposed Sunrise Powerlink 500-kV transmission line that would also interconnect with the Imperial Valley electrical substation.

The engineering and environmental details of the proposed project are contained in the AFC. Copies of the AFC are available at the local public agencies that are involved in the review process and at the following libraries: Imperial County Free Library, Ocotillo and Seeley Branches; Fresno County Library; San Diego Public Library; UCLA, University Research Library; Barstow Branch Library; San Bernardino County Library; Humboldt Library; San Francisco Public Library; the Energy Commission's Library in Sacramento; and the California State Library in Sacramento.

Proposed Schedule and Issue Identification Report

To assist the parties and public in understanding the process, Staff shall file a proposed schedule for project review. Staff shall also file an Issue Identification Report summarizing the major issues. The proposed schedule and Staff's report shall be filed no later than noon on November 17, 2008. The Applicant shall file its response, if any, no later than noon on November 20, 2008.

Public Adviser and Public Participation

The Energy Commission Public Adviser Office is available to assist the public in participating in the application review process. For those individuals who require general information on how to participate, please contact the Associate Public Adviser, Loreen R. McMahon at (916) 654-4489 or 1-800-822-6228 or e-mail: [\[publicadviser@energy.state.ca.us\]](mailto:publicadviser@energy.state.ca.us). If you have a disability and need assistance to participate in this event, contact Lourdes Quiroz at 916-654-5146 or e-mail: [\[lquiroz@energy.state.ca.us\]](mailto:lquiroz@energy.state.ca.us).

Information

Questions of a legal or procedural nature should be directed to Raoul Renaud, the Hearing Officer, at (916) 651-2020 or e-mail: [\[rrenaud@energy.state.ca.us\]](mailto:rrenaud@energy.state.ca.us).

Technical questions concerning the Project should be addressed to Christopher Meyer, the Staff Project Manager, at (916) 653-1639 or e-mail: [\[cmeyer@energy.state.ca.us\]](mailto:cmeyer@energy.state.ca.us).

Technical questions concerning the BLM permitting process should be addressed to Lynda Kastoll at (760) 337-4421, [\[lynda_kastoll@ca.blm.gov\]](mailto:lynda_kastoll@ca.blm.gov) or Jim Stobaugh, (775) 861-6478, [\[Jim_Stobaugh@blm.gov\]](mailto:Jim_Stobaugh@blm.gov).

Media inquiries should be directed to the Office of Media and Public Communications at (916) 654-4989 or e-mail: [\[mediaoffice@energy.state.ca.us\]](mailto:mediaoffice@energy.state.ca.us).

Information concerning the status of the project, as well as notices and other relevant documents may be viewed on the Energy Commission's Internet web page at: [\[http://www.energy.ca.gov/sitingcases/solartwo/\]](http://www.energy.ca.gov/sitingcases/solartwo/).

**DEPARTMENT OF THE INTERIOR
Bureau of Land Management
(CACA 47740, LLCAD07000 L51030000)**

**Notice of Intent to Prepare an Environmental Impact Statement/Staff Assessment
and
Proposed Land Use Plan Amendment for the Proposed SES Solar Two Project,
Imperial County, California**

**AGENCY: Bureau of Land Management
ACTION: Notice (4310-40-P)**

SUMMARY: In compliance with the National Environmental Policy Act of 1969, as amended (NEPA), and the California Environmental Quality Act (CEQA), the Department of the Interior, Bureau of Land Management (BLM), together with the California Energy Commission, (hereinafter jointly referred to as the Agencies) intend to prepare an Environmental Impact Statement / Staff Assessment (EIS/SA), and a Proposed Land Use Plan Amendment for the Stirling Energy Systems (SES) Solar Two Project (Project), a Stirling engine systems solar dish project in Imperial County, California. SES is seeking approval to construct and operate an electrical generating facility with a nominal capacity of 750 megawatts (MW), using concentrated solar thermal power. The approximately 6,500 acres of land needed to develop the Project consists of approximately 6,140 acres of BLM administered public land and approximately 360 acres of privately owned land. SES has submitted an application to the BLM requesting a right-of-way (ROW) to construct the Project and related facilities. Pursuant to the California Desert Conservation Area (CDCA) Plan (1980, as amended), sites associated with power generation or transmission not identified in the CDCA Plan will be considered through the plan amendment process.

Under Federal law, BLM is responsible for processing requests for rights-of-way to authorize such proposed projects and associated transmission lines and other appurtenant facilities on land it manages. BLM must comply with the requirements of NEPA to ensure that environmental impacts associated with construction, operation, and decommissioning will be identified, analyzed and considered in the application process. In the case of solar thermal power plant projects, this will be accomplished through coordination of the state and federal application processes, public participation, environmental analysis, and the preparation of Draft and Final Environmental Impact Statement (EIS) in coordination with the Energy Commission and its Preliminary and Final Staff Assessments.

Under California law, the Energy Commission is responsible for reviewing the Application for Certification filed for thermal power plants over 50 MW, and also has the role of lead agency for the environmental review of such projects under the CEQA (Pub. Res. Code, §§ 21000 et seq., 25500 et seq.) The Energy Commission conducts this

review in accordance with the administrative adjudication provisions of the Administrative Procedure Act (Gov't. Code § 11400 et seq.) and its own regulations governing site certification proceedings (Cal. Code Regs., tit. 20, § 1701 et seq.), which have been deemed CEQA equivalent by the Secretary of Resources. SES Solar Two, LLC, has submitted an Application for Certification (AFC) to the Energy Commission. The AFC facilitates analysis and review by staff prior to an Energy Commission decision on the proposed project.

DATES: Publication of this notice initiates a public scoping period of at least 30 days. During the public scoping period, the Agencies will solicit public comments on issues, concerns, potential impacts, alternatives, and mitigation measures that should be considered in the analysis of the proposed action. In addition, the Agencies expect to hold at least one public meeting/workshop during the scoping period to encourage public input. The public meeting(s) will be announced through the local news media, newspapers, mailings, the BLM web page [<http://www.ca.blm.gov/elcentro>] and the Energy Commission web page [<http://www.energy.ca.gov/sitingcases/solartwo/>] at least 15 days prior to the event. While you may have the opportunity to make oral comments, comments must also be submitted in writing. In order to be included in the Draft EIS/Preliminary Staff Assessment (DEIS/PSA), all comments must be received prior to the close of the scoping period or 15 days after the last public meeting, whichever is later. Additional opportunities for public participation and formal comment occur when the DEIS/PSA is issued.

ADDRESSES: You may submit comments in a variety of ways: 1) By U.S. mail, 2) by electronic mail, (3) or by attending the public scoping meeting(s) and submitting written comments at the meeting(s). By Mail: Please use first-class postage and be sure to include your name and a return address. Please send written comment to: Christopher Meyer, Project Manager, Siting, Transmission and Environmental Protection Division, California Energy Commission, 1516 Ninth Street, MS-15, Sacramento, CA, 95814. By Electronic Mail: e-mail comments are welcome; however, please remember to include your name and return address in the e-mail message. E-mail should be sent to [cmeyer@energy.state.ca.us].

Before including your address, phone number, e-mail address, or other personal identifying information in your comment, you should be aware that your entire comment including your personal identifying information may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

FOR FURTHER INFORMATION CONTACT: Information regarding the BLM process may be obtained from the Bureau of Land Management, 1661 So. 4th Street, El Centro, California 92243, attention Lynda Kastoll, (760) 337-4421, [lynda_kastoll@ca.blm.gov]; or Erin Dreyfuss, (760) 337-4436, [erin_dreyfuss@ca.blm.gov]. Information regarding the Energy Commission process may be obtained from Christopher Meyer, Project Manager, Siting, Transmission and Environmental Protection Division, California Energy Commission, 1516 Ninth Street, MS-15, Sacramento, CA 95814, (916) 653-1639, [cmeyer@energy.state.ca.us].

Information on participating in the Commission's review of the project may be obtained through the Commission's Public Adviser's Office, at (916) 654-4489 or toll free in California, (800) 822-6228, or by email: [publicadviser@energy.state.ca.us] News media inquiries should be directed to the Commission's media office at (916) 654-4989, or via email at [mediaoffice@energy.state.ca.us].

Status of the proposed project, copies of notices, an electronic version of the AFC, and other relevant documents are also available on the Commission's internet web site at [<http://www.energy.ca.gov/sitingcases/solartwo/>]. You can also subscribe to receive email notification of all notices at [<http://www.energy.ca.gov/listservers/>].

SUPPLEMENTARY INFORMATION: SES Solar Two, LLC has applied to BLM for a right-of-way on public lands to construct a concentrated solar thermal power plant facility approximately 14 miles west of El Centro, CA, in Imperial County. The project site is just south of Plaster City between the Union Pacific Railroad tracks and the Interstate 8 highway. The facility is expected to operate for approximately 30 years. The proposed project would utilize SunCatcher technology, consisting of approximately 30,000 25-kilowatt solar power dishes with a generating capacity of approximately 750 megawatts (MW) to be built in two phases. The first phase would consist up to 12,000 SunCatchers configured in 200 1.5 MW solar groups of 60 SunCatchers per group and have a net nominal generating capacity of 300 MW. The second phase would consist of approximately 18,000 SunCatchers configured in 300 1.5 MW groups with a net generating capacity of 450 MW. Each SunCatcher system consists of an approximate 38-foot high by 40-foot wide solar concentrator dish that supports an array of curved glass mirror facets designed to automatically track the sun and focus solar energy onto a Power Conversion Unit which generates electricity. Related structures would include a main services complex, assembly buildings, a 230-kilovolts (kV) electrical substation, access roads, supply water line, and a 10-mile double circuit 230-kV transmission line from the project site to San Diego Gas and Electric's existing Imperial Valley electrical substation. The 450 MW Phase II is dependent on the approval and construction of additional transmission such as the proposed Sunrise Powerlink 500-kV transmission line that would also interconnect with the Imperial Valley electrical substation. The EIS/SA will analyze the site-specific impacts on air quality, biological resources, cultural resources, water resources, geological resources and hazards, hazardous materials handling, land use, noise, paleontological resources, public health, socioeconomics, soils, traffic and transportation, visual resources, waste management and worker safety and fire protection, as well as facility design engineering, efficiency, reliability, transmission system engineering and transmission line safety and nuisance. The CDCA Plan, while recognizing the potential compatibility of solar generation facilities on public lands, requires that all sites associated with power generation or transmission not identified in the Plan will be considered through the Plan Amendment process.

The following Planning Criteria will be utilized during the plan amendment process:

- The plan amendment process will be completed in compliance with FLPMA, NEPA, and all other relevant Federal laws, Executive orders, and management policies of the BLM;

- The plan amendment process will include an EIS that will comply with NEPA standards;
- Where existing planning decisions are still valid, those decisions may remain unchanged and be incorporated into the new plan amendment;
- The plan amendment will recognize valid existing rights;
- Native American Tribal consultations will be conducted in accordance with policy and Tribal concerns will be given due consideration. The plan amendment process will include the consideration of any impacts on Indian trust assets;
- Consultation with the SHPO will be conducted throughout the plan amendment process; and
- Consultation with USFWS will be conducted throughout the plan amendment process.

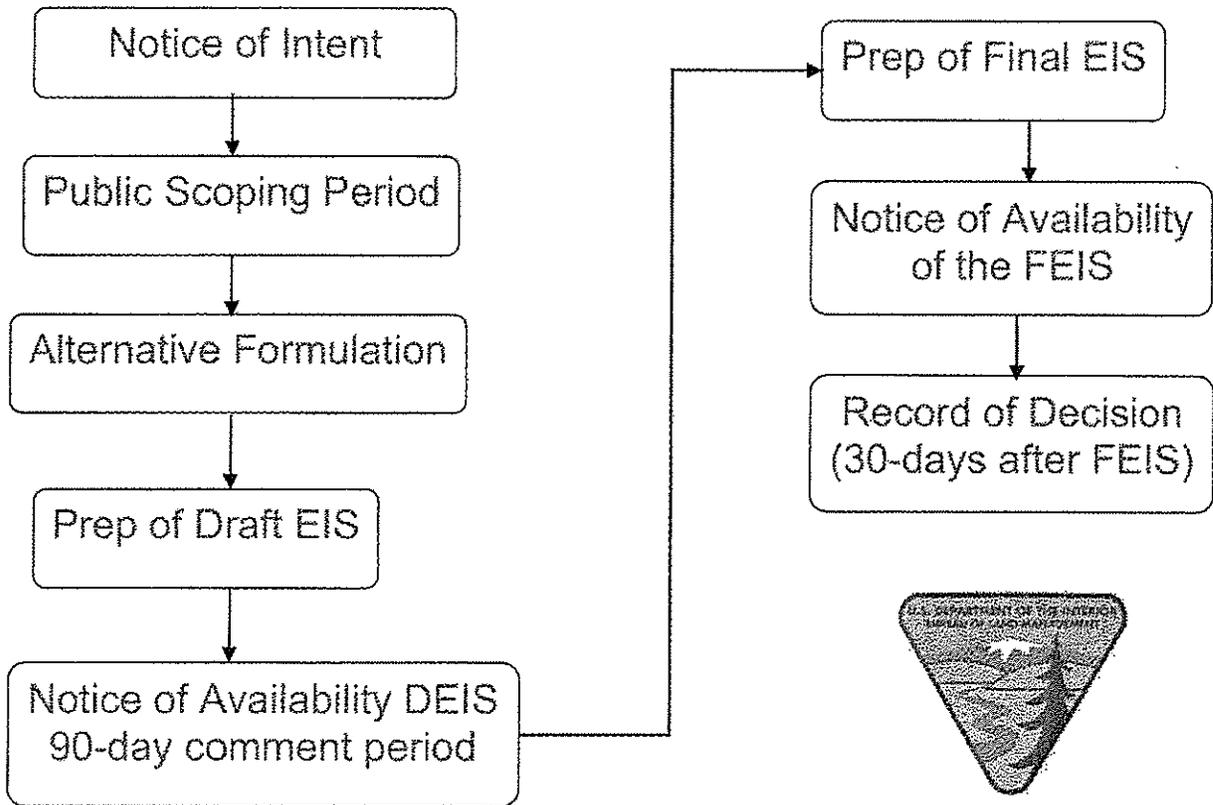

If the ROW and proposed land use plan amendment are approved by BLM, the concentrated solar thermal power plant facility on public lands would be authorized in accordance with Title V of the Federal Land Policy and Management Act of 1976 and the Federal Regulations at 43 CFR 2800. A certificate designating approval of the Energy Commission must be obtained by SES before it may construct a power plant and/or electric transmission line and related facilities.

Crews overwhelmed by raging wildfire

► **HOMES BURN:**
Fire still not contained.

SANTA BARBARA (AP) — Firefighters held their own Friday against a dangerous wildfire that destroyed more than 100 homes in a wealthy, celebrity-studded enclave and credited lighter-than-expected winds for helping them keep the blaze from growing.

But authorities cautioned that the blaze in the Montecito was still uncontained and could flare up again as wind gusts of up to 30 mph picked up at sundown, despite a day of grueling work by more than 1,000 firefighters. Several more homes burned Friday. "It's not a time to

Rick Pointer (right), professor of history at Westmont College, his daughter Katie and wife, Barbara, look over the ruins of their home, one of several Westmont faculty homes lost, Friday morning after a wildfire that began Thursday destroyed about 100 homes and other structures in Montecito.

relax," said Santa Barbara County Deputy Fire Chief Tom Franklin. "Everybody's got to be diligent through tonight. It's the last evening of these wind events." Franklin said "upwards of 150 homes" may have

burned in the area and asked for patience from residents as crews try to

catalog the devastation in remote hilly areas accessible only by winding roads. There were 3,500 parcels in the hardest-hit area and all homes might not be accounted for until Sunday, said Santa Barbara City Fire Chief Ron Prince.

"We want to make sure the area is completely safe before we let people back in there," he said. "I have to beg, basically, for your patience." The fire may also have claimed a victim: a 98-year-old man with multiple medical problems died after being evacuated to a hotel, but it was unclear if his death was directly related to the blaze, Santa Barbara County Sheriff-Coroner Bill Brown said.

No more details were immediately available.

Earlier Friday, blistering winds gusting to 70 mph, dry brush and oil-rich eucalyptus trees helped turn an ordinary brush fire into an exploding inferno.

AP PHOTO
State employee Debble Berman, a single mother of four, said the state could stop paying overtime on holidays rather than eliminating two days, when discussing Gov. Arnold Schwarzenegger's proposal to take two holidays from state employees outside the Capitol in Sacramento on Thursday.

Budget fix: Trim holidays

► **STATE WORKERS:** Governor's idea could save \$114 million.

SACRAMENTO (AP) — Gov. Arnold Schwarzenegger has nothing against Lincoln or Columbus. He just thinks state workers don't need their holidays as a paid day off while California faces a mounting budget deficit.

The governor has proposed eliminating them as paid holidays, a move his administration estimates will save California \$114 million during this fiscal year and the next one starting in July. Much of that will come from saved overtime costs.

"We think it's not so

Utah, which is experimenting with a four-day work week, eliminated Columbus Day as a paid holiday.

Genest, Schwarzenegger's finance director.

California is one of just a few states considering trimming the number of paid days off given to state employees as a way to save money in lean economic times.

New Jersey passed a benefit-cutting bill in September that included eliminating Lincoln's Birthday as a state paid holiday amid a budget deficit projected to reach \$12 billion in the current fiscal year. Gov. Jon Corzine also stopped issuing an annual executive order giving employees the day after Thanksgiving as a paid day off, ending a long-standing tradition.

CALIFORNIA BRIEFS

Police: 3 dead in office park shooting

SANTA CLARA — Police are searching for a man who allegedly returned to the office where he was recently laid off and opened fire, killing three people.

The suspect is identified as 47-year-old Jing Wu of Mountain View.

Santa Clara Police Lt. Mike Sellers says the shooting happened just before 4 p.m. Friday at an office complex on Scott Boulevard and Montgomery Drive. The victims are two men and one woman.

Police say the bodies were found in Building 7 of the complex, but they won't release the name of the company that had laid off Wu.

Sellers says Wu is about 5 feet 7 inches tall and weighs 170 pounds and may have been driving a silver Mountaineer SUV.

Twist in Web hoax trial

LOS ANGELES — Evidence from the suicide of a Missouri girl

can be used by prosecutors against a woman charged with helping to create a false Internet identity that was used to harass the teenager, a federal judge ruled Friday.

The ruling came days before the start of the potentially groundbreaking trial of Lori Drew, 49, of O'Fallon, Mo., who pleaded not guilty to conspiracy and accessing computers without authorization. Prosecutors said Drew helped create the MySpace account and harassed Megan Meier.

Prosecutors say Meier, 13, who was being treated for depression, hanged herself after receiving messages saying the world would be better off without her.

Drew's lawyer had argued the suicide evidence would lead jurors to focus on the death, rather than whether Drew violated the terms of service of MySpace.

POWER PLANT PUBLIC HEARING AND SITE VISIT
by the California Energy Commission
www.energy.ca.gov
and the US Bureau of Land Management

DATE: Monday, November 24, 2008
TIME: 2:30 p.m. Site Visit, bus departs from County Administration Building (BUS RESERVATIONS REQUIRED)
4:00 p.m. Informational Hearing/Scoping Meeting

LOCATION: County of El Centro
County Administration Building
Board Chambers
940 Main Street, El Centro, CA 92243

The California Energy Commission and the US Bureau of Land Management will hold a joint site visit and informational hearing/scoping meeting regarding Stirling Energy Systems Solar Two Power Project application to construct and operate a nominal 750-megawatt concentrating solar dish power system, including transmission lines, substation and other associated facilities. Proposed to be located about 14 miles west of El Centro, it would involve about 6,500 acres, including 6,140 acres of BLM-administered public lands and 360 acres of private lands. The site visit will show the exact location of the proposed project and the public meeting will provide project details, as well as an explanation of the agency joint processes and requirements under the California Environmental Quality Act and the National Environmental Policy Act, including public participation opportunities and comment periods. This will be the first of several public events during the review of this proposed project.

Intensa revisión a proyecto de Casino

Presentarán casas construidas por residentes

ARTURO BOJORQUEZ
arturo@opiniononline.com

De manera enérgica, el Supervisor del Condado por el Distrito 1, Victor Carrillo, exigió a los altos funcionarios del gobierno local un trato justo para el proyecto del Casino de Caléxico y no ponerle obstáculos.

El supervisor indicó que las autoridades no trataron de la misma forma al Centro Comercial del Valle Imperial a como se está haciendo con el casino.

"Espero que no se enfrente el asunto para poner obstáculos", afirmó Carrillo, quien admitió que el proyecto del casino debe contar con medidas que mitiguen cualquier impacto al cien por ciento.

Carrillo agregó que los problemas de tránsito vehicular en el Centro Comercial no han sido resueltos por "opiniones subjetivas".

El supervisor aseguró que aún falta por arreglar varias calles como Chick, Dogwood, McCabe y la Carretera 86.

"Yo no veo impactos adicionales sólo por contar con un casino", dijo Carrillo respecto al Reporte de Impacto Ambiental emitido por la Ciudad de Caléxico a finales del mes de octubre.

El Supervisor por el Distrito 3, Joe Maruca, señaló que los problemas del tránsito vehicular alrededor del Centro Comercial no eran el objetivo de este proyecto.

Maruca recordó que Caléxico se opuso a la construcción del "Mall" en voz

El proyecto de construcción del Casino de Caléxico enfrenta un duro análisis por parte de las autoridades del Condado de Imperial.

Revisan hasta la ortografía

ARTURO BOJORQUEZ
arturo@opiniononline.com

La respuesta del gobierno del condado al Reporte de Impacto Ambiental llevó a los funcionarios locales a hacer comentarios hasta por la forma en que fue redactado.

Las asociaciones oficiales indican que el Departamento de Planeación y Servicios para el Desarrollo, según un documento firmado por el titular de esta agencia, Jurg Heuberger.

Además, el funcionario señala varios errores de escritura en el Mapa de Uso de Suelo.

Este mismo departamento le pide a los responsables del Casino a estudiar todas las calles que se ubiquen a 20 millas a la redonda, esto es, desde Ocotillo hasta Brawley y Holtville, así como el pago de mejoras de estos caminos.

También piden mejorar los sistemas de agua, drenaje y electricidad.

Entre estos últimos destaca la ampliación de un tramo del Camino Dogwood, entre la Carretera 8 y el Camino McCabe, que desde un principio estuvo a cargo del condado, la Ciudad de El Centro y los desarrolladores del Centro Comercial del Valle Imperial.

Heuberger fue el único que señaló inconsistencias en el tamaño del terreno que ocupará el Casino.

El Director de Obras Públicas del Condado, Bill Brunet, presentó en otro documento la necesidad de mejorar o pagar una "parte justa" de más de 20 proyectos de calles en la región, incluido el Corredor del Camino Jasper y el análisis del aumento del tránsito desde la Garita Este.

Ante los posibles problemas que cause el Casino a las familias locales, el Departamento de Servicios Sociales solicitó casi 42 mil dólares para contratar personal.

"Una vez que el casino esté en operación, revisaremos el impacto actual y los costos para darles la información que se requiera", agregó James Semmes, Director de Servicios Sociales.

Brad Poirier, Director del Distrito de Control de la Contaminación del Aire, así como Tony Roubotas, Director de Bomberos, hicieron señalamientos al reporte.

El Alguacil del Condado, Ray Loera, solamente estimó que el impacto del casino en los servicios carcelarios y de investigaciones -entre otros-, serán moderados, al proporcionar una lista del costo por hora de éstos.

de su entonces Director de Obras Públicas, Mariano Martínez.

Por su parte, el Director del Departamento de Planeación y Servicios para el Desarrollo, Jurg Heuberger, mencionó que el proyecto del Centro Comercial tomó más tiempo revisarlo, al aceptar que los impactos de éste no se analizaron adecuadamente.

El funcionario del condado expresó que el reporte no cuenta con un plan específico para el casino.

Heuberger mencionó que el tema no habría sido abordado el martes de no ser por la controversia que se ha levantado.

La fecha límite para expresar opiniones respecto al documento vence este viernes 21.

El director informó que el reporte no es final, ya que todavía falta otra etapa de audiencias y comentarios.

El Supervisor por el Distrito 5 y ferreo opositor al Casino, Wally Leimgruber, mencionó que todos los proyectos se analizan de la misma forma.

Añadió que el Casino Paradise, en Winterhaven, se encuentra en territorio indígena, mientras el de Manzanita está fuera de reservación.

Al ser cuestionado por Carrillo sobre la ausencia de autoridades de Caléxico y de la Tribu Manzanita, el Oficial Ejecutivo en Jefe, Ralph Córdova, respondió que éstos no fueron notificados personalmente, pero dijo que la agenda fue publicada el jueves.

ARTURO BOJORQUEZ
arturo@opiniononline.com

BRAWLEY — El próximo martes 25 de noviembre, la Coalición de Vivienda del Valle de Coachella (CVHC) presentará las residencias de 12 personas que construyeron sus casas con sus propias manos, dentro del Programa de Auto Ayuda.

El evento se llevará a cabo a las 4:30 de la tarde en la Comunidad Poo Colonia de Auto Ayuda, ubicada en el Camino Cady en esta ciudad.

De acuerdo a un comunicado de la CVHC, las familias decidieron abrir las puertas de sus casas y mostrar al vecindario "para demostrar a la comunidad lo que un grupo de individuos pueden hacer para mejorar las vidas de sus familias y cambiar el rostro de la comunidad".

Este es el primer proyecto hecho por el programa y se espera que en el futuro se construyan otras 12 residencias.

Las Colonias Poo son administradas por el Departamento de Vivienda y Desarrollo Urbano (HUD) del gobierno federal en áreas rurales ubicadas a 150 millas de la frontera entre México y Estados Unidos.

Dentro de este proyecto de auto ayuda, entre 10 y 15 familias trabajan juntas para construir hasta 12 viviendas, las cuales son ocupadas hasta que son terminadas.

El promedio del costo de cada residencia es de 170 mil dólares y se les asigna una hipoteca de hasta 145 mil dólares a cada familia.

El pago de "entre" se da con la mano de obra de las familias.

El programa ha ayudado a unas mil 300 familias en la región, de las cuales 27 se ubican en Brawley.

AUDIENCIA PÚBLICA
By the California Energy Commission and the US Bureau of Land Management
www.energy.ca.gov

FECHA: Lunes, 24 de Noviembre de 2008
HORA: 2:00 p.m.: Salida del autobús para la visita al emplazamiento
(ES NECESARIO HACER RESERVACIONES PARA EL AUTOBÚS)
3:30 p.m. Audiencia Informativa
LUGAR: County of Imperial
County Administration Center
Board Chambers
940 Main Street, El Centro, CA 92243

La Comisión de Energía de California y la Oficina de Administración de Tierras de los Estados Unidos realizarán una visita conjunta al emplazamiento, una audiencia pública y una reunión para tratar el alcance de la solicitud de realización del proyecto Siting Energy Systems Solar Two Power Project, cuya finalidad es construir y operar un sistema de energía a base de paneles solares con una capacidad nominal de 750 megavatios, el cual incluye líneas de transmisión, una subestación y otras instalaciones asociadas. Con una ubicación propuesta a aproximadamente 14 millas al oeste de El Centro, comprendería aproximadamente 6,500 acres, incluidos 6,140 acres de terrenos públicos administrados por la Oficina de Administración de Tierras (BLM, por sus siglas en inglés) y 360 acres de terrenos privados. En la visita al emplazamiento se mostrará la ubicación exacta del proyecto propuesto, y en la reunión pública se entregarán los detalles del proyecto, así como una explicación de los procesos conjuntos de la agenda y de los requisitos conforme a la Ley de calidad ambiental de California y a la Ley nacional de política ambiental, que incluye las oportunidades de participación pública y los períodos de comentarios. Este será el primero de muchos eventos públicos durante la revisión de este proyecto propuesto.

Reservaciones para el autobús llame:
La Oficina del Asesor Público

APPENDIX E

SES SOLAR TWO FACT SHEETS

This appendix contains the following:

- SES Solar Two Fact Sheet (English [4 pages])
- SES Solar Two Fact Sheet (Spanish [4 pages])

SOLAR TWO FACT SHEET

ABOUT STIRLING ENERGY SYSTEMS

- Unique SunCatcher technology that combines a mirrored concentrator dish with a high-efficiency Stirling engine specially designed to convert sunlight to electricity.
- Technology on the ground since 1984.
- Holds World Record in efficiency of converting the sun's energy into grid-quality electricity.
- A United States Company Headquartered in Phoenix, Arizona:
 - Project & technical development offices are located in Tustin, California and Albuquerque, New Mexico.
- Renewable utility grade power ready for commercialization.

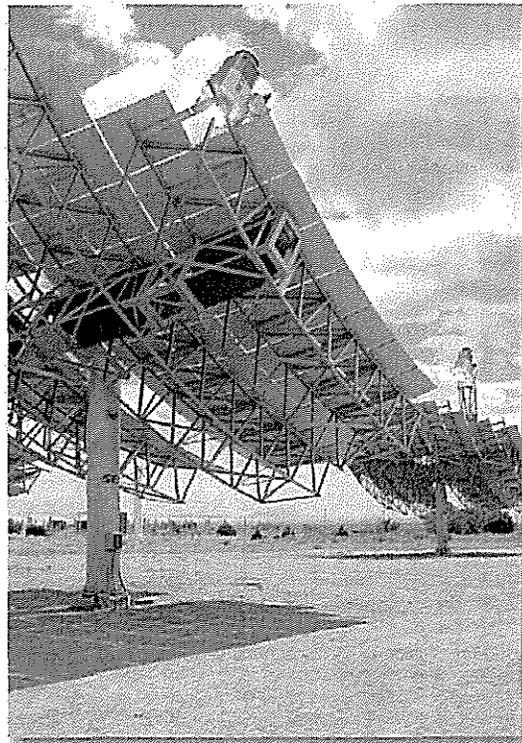

PURPOSE

- Provide up to 750MW of renewable electric capacity under a 20-year Power Purchase Agreement (PPA) to San Diego Gas & Electric (SDG&E).
- Develop renewable solar energy to help California achieve its Renewables Portfolio Standard (RPS) requirement.
- Help protect the environment by delivering clean, renewable solar energy.
- Assist the State of California in meeting its goal of reducing greenhouse gas emissions to 1990 levels by 2020 (Assembly Bill 32).

SOLAR TWO PROJECT DESCRIPTION

Project Size/Location

- One of the world's largest solar power projects.
- 750 net megawatt (MW) solar power project in Imperial Valley, California.

Technology

Solar Two would consist of:

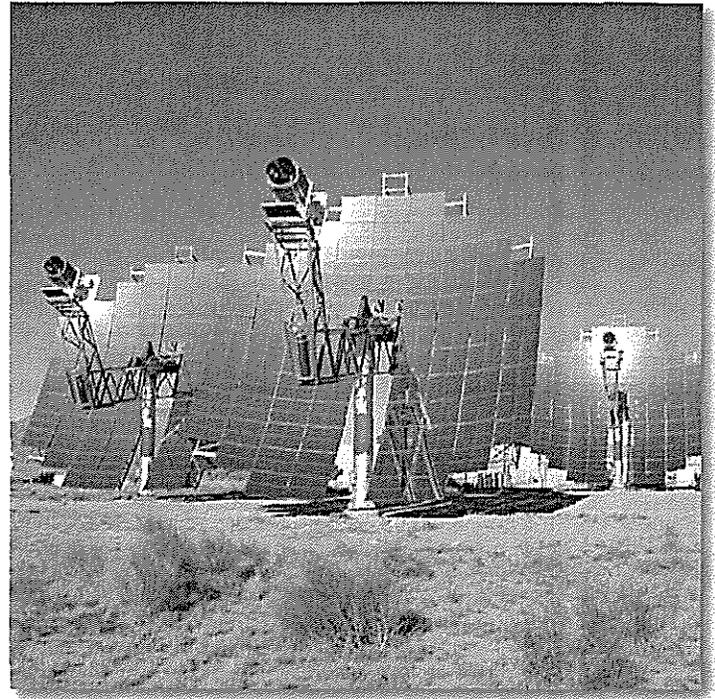

- Approximately 30,000 solar dish Stirling systems (referred to as SunCatchers) which would consist of solar concentrating dishes and Stirling Engine Power Conversion Units (PCUs).
- Associated equipment and support systems.

Construction

- The Project would be constructed in two phases. Phase I would consist of up to 12,000 SunCatchers and produce a net 300MW. Phase II would expand the Project with 18,000 SunCatchers and produce a net 450MW.
- Subject to receipt of all necessary approvals, construction should start in 2010, with projected commercial operations beginning later that year.

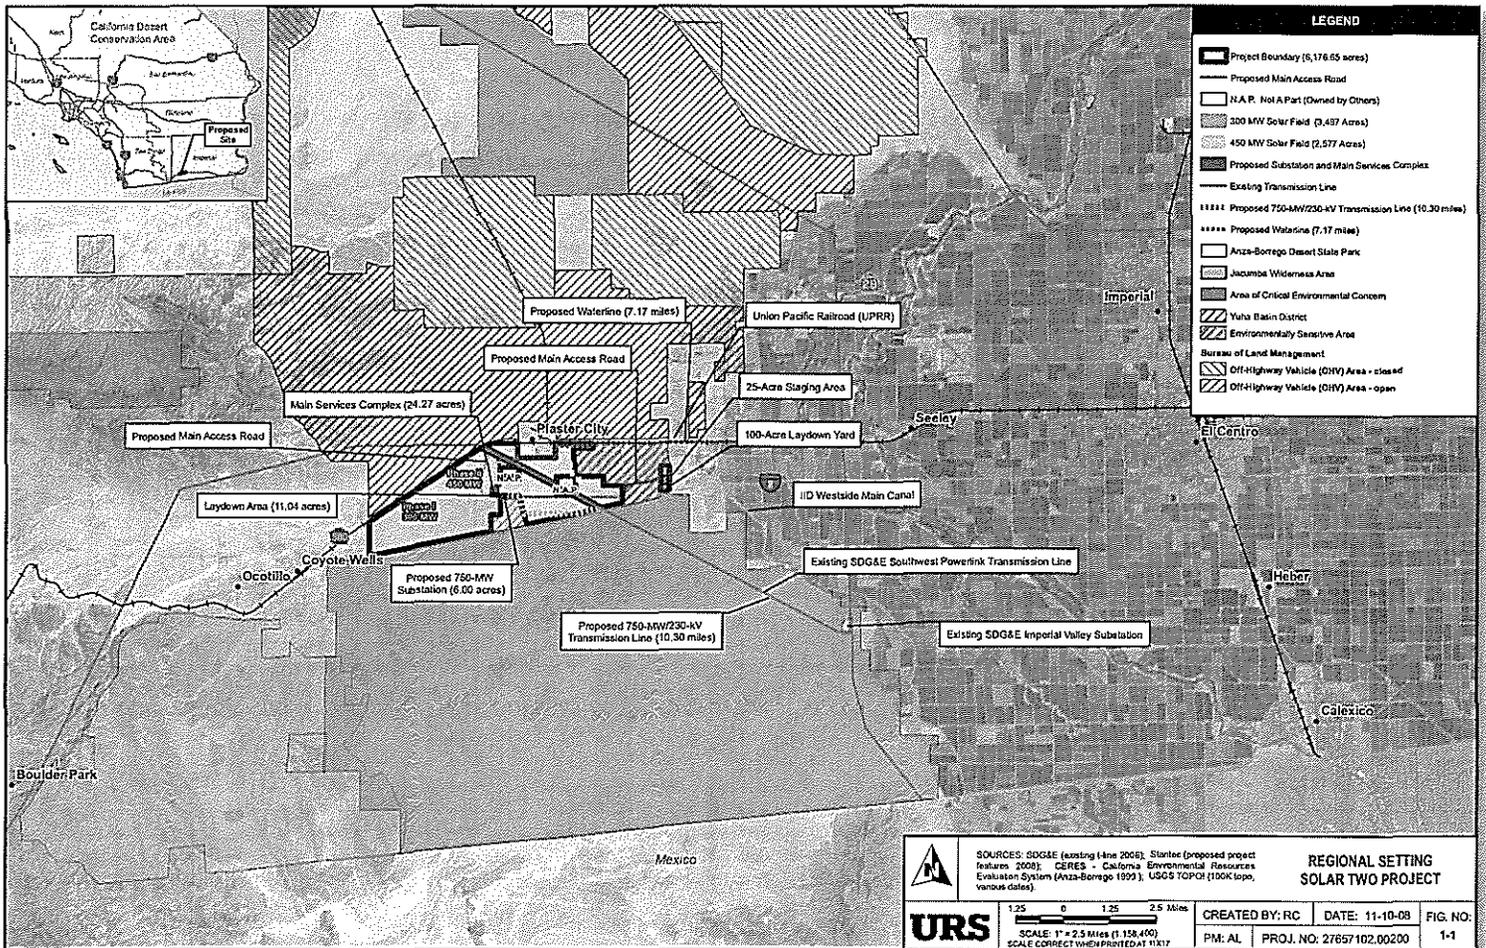

Transmission

- Construction of a new 230kV substation located in the center of the Project Site.
- Interconnection to the SDG&E Imperial Valley Substation.

SOLAR TWO SITE LOCATION

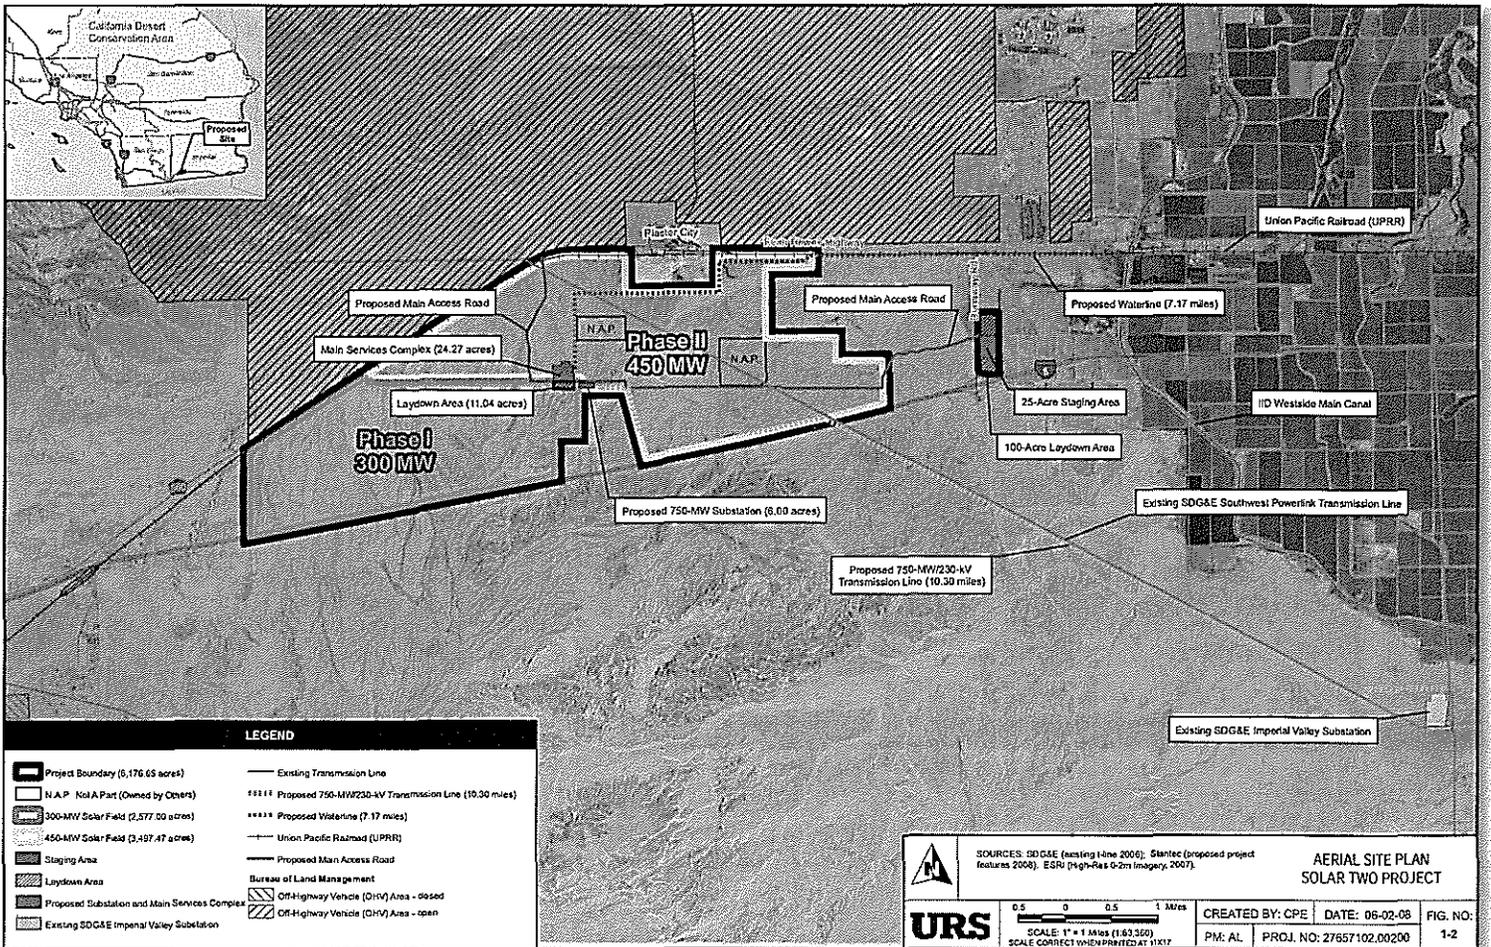

- Located on approximately 6,140 acres of federal land administered by the Bureau of Land Management (BLM) and 360 acres of private land.
- The Project was sited to avoid or minimize impacts to recreation and environmentally-sensitive areas.

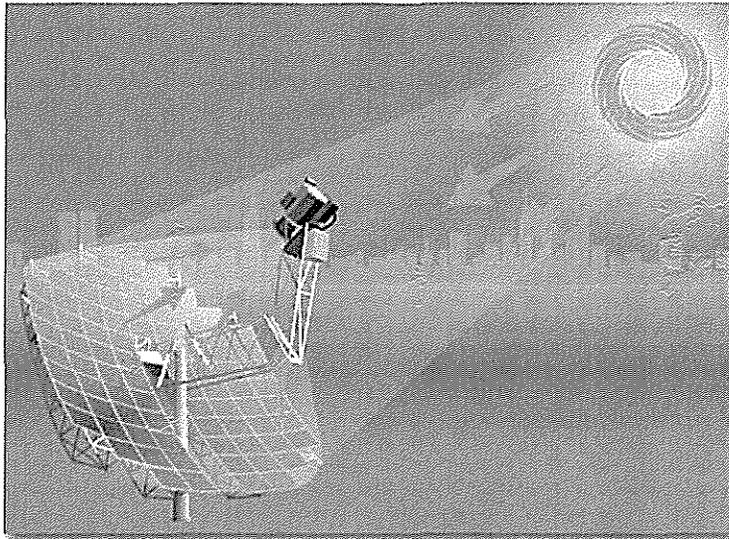

SOLAR TWO VISUAL SIMULATIONS

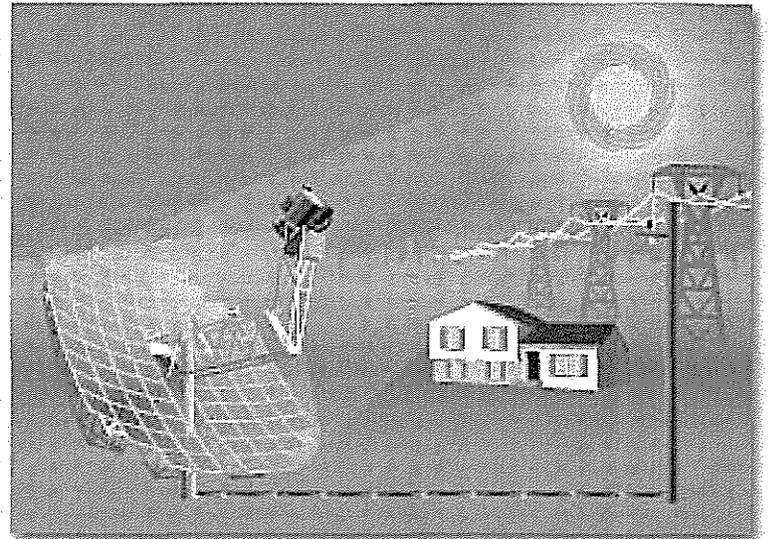

Top: Street view
 Left: Aerial view
 Bottom: Aerial site plan

SOLAR TWO PROJECT PROCESS (HOW IT WORKS)

Dish concentrator tracks, collects, and focuses the sun's energy.

Stirling engine converts energy to grid-quality electricity.

SOLAR TWO PROJECT BENEFITS

- Solar Two would develop renewable solar energy to help California achieve its RPS requirement and in meeting its goal of reducing greenhouse gas emissions to 1990 levels by 2020.
- The Project would introduce approximately 160 permanent jobs in the supervisory, administrative, construction, operations and maintenance fields.
- Construction of Solar Two would lead to increased revenue from sales taxes, due to construction and operational employees' economic activities.
- Solar Two would provide approximately \$60,000,000 (in 2008 dollars) in construction payroll with an average monthly construction workforce of approximately 360 jobs.
- Educational benefits – students from local schools and colleges are expected to study the Project as a model for future growth in the renewable energy development and technology.
- Potential boosts to tourism are also anticipated.

SOLAR TWO PROJECTED PROJECT SCHEDULE

~~2008~~ 2008 – 2nd Quarter
File Application for Certification

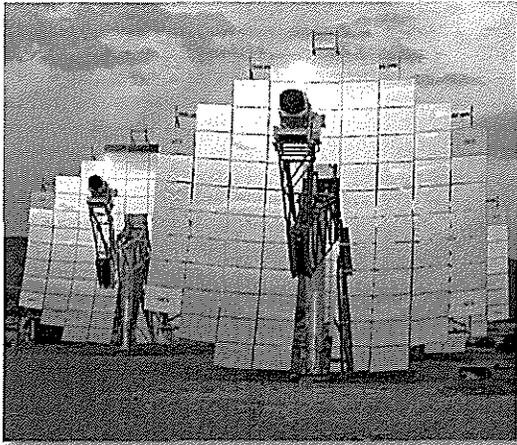

~~2009~~ 2009 – 4th Quarter
Receive Certification

~~2010~~ 2010 – 1st quarter
Begin Construction
– 3rd Quarter, Phase I
First Units Online

~~2012~~ 2012 – 2nd Quarter, Phase II
First Units Online

~~2014~~ 2014 – 4th Quarter
Completion of 750MW Project Construction

HOJA DE INFORMACIÓN SOLAR DOS

SOBRE LA COMPAÑÍA STIRLING ENERGY SYSTEMS

- Tecnología exclusiva de SunCatcher que combina una parabólica concentrador de espejos con un motor Stirling de gran rendimiento específicamente diseñado para convertir la luz solar en electricidad.
- Tecnología usado desde el año 1984.
- Posee el récord mundial en eficiencia para la conversión de energía solar en electricidad de calidad para red eléctrica.
- Compañía de los E.E.U.U. con sede en Phoenix, Arizona.
 - Oficinas para proyecto y desarrollo técnico ubicadas en Tustin, California y en Albuquerque, Nuevo México.
- Energía renovable de grado de servicios públicos lista para comercialización.

PROPÓSITO DEL PROYECTO SOLAR DOS

- Proveer hasta 750 megavatios de capacidad de electricidad renovable, en conformidad con un acuerdo de 20 años de compra de energía con San Diego Gas y Energía Eléctrica.
- Desarrollar energía solar renovable para ayudar al estado de California a realizar su requisito a Criterio de Portafolio Renovable (RPS).
- Ayudar a proteger el medio ambiente al proveer energía solar limpia y renovable.
- Ayudar al estado de California a lograr su meta para reducir las emisiones de gases invernaderos a los niveles del año 1990 por el año 2020 (Proyecto de Ley Número 32 de la Asamblea).

DESCRIPCIÓN DEL PROYECTO SOLAR DOS

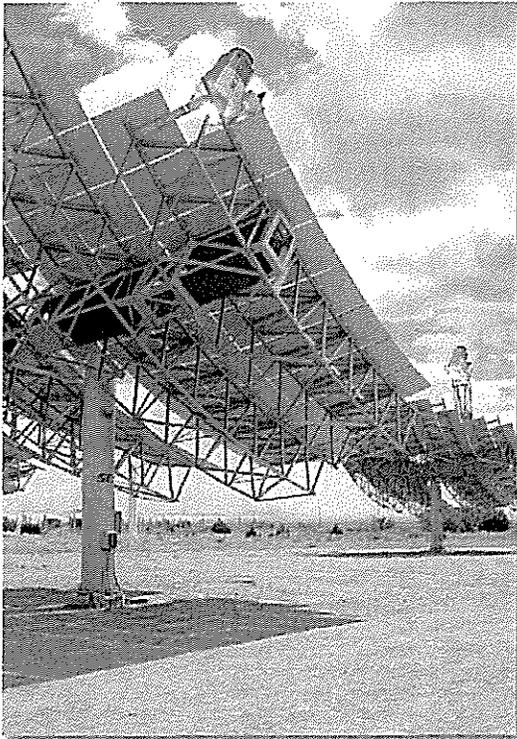

Tamaño del Proyecto/Ubicación

- Uno de los proyectos de energía solar más grandes del mundo.
- Proyecto de energía solar de 750 megavatios (cantidad neta) en el Valle Imperial de California.

Tecnología

Solar Dos consistiría de:

- Aproximadamente 30.000 SunCatchers y Unidades de Conversación de Energía Motor Solar Stirling.
- Equipo y sistemas de apoyo asociados.

Construcción

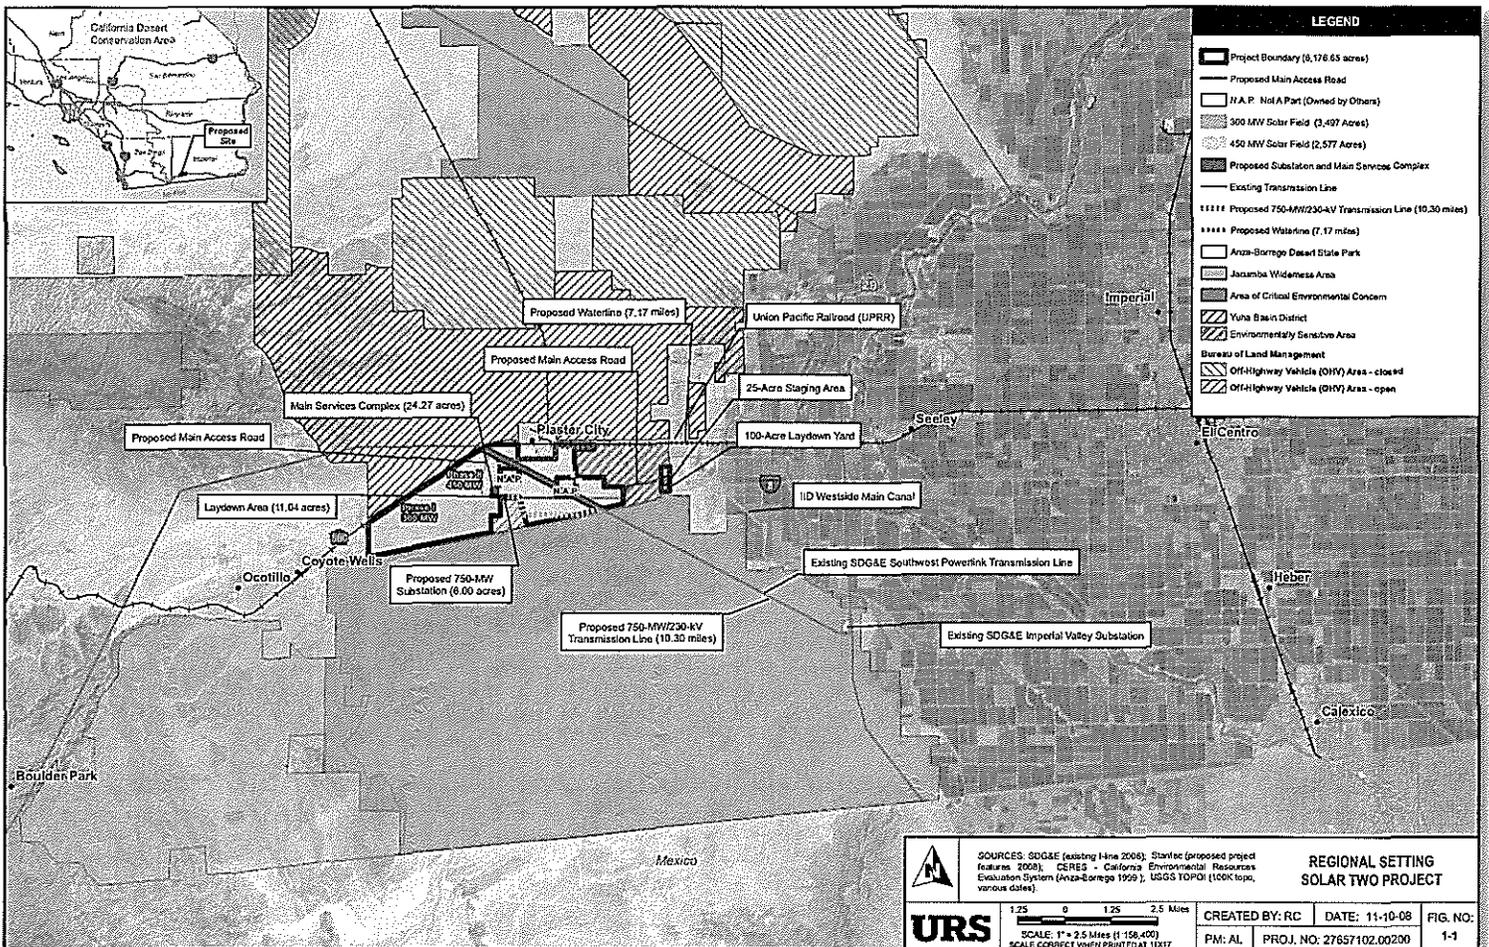

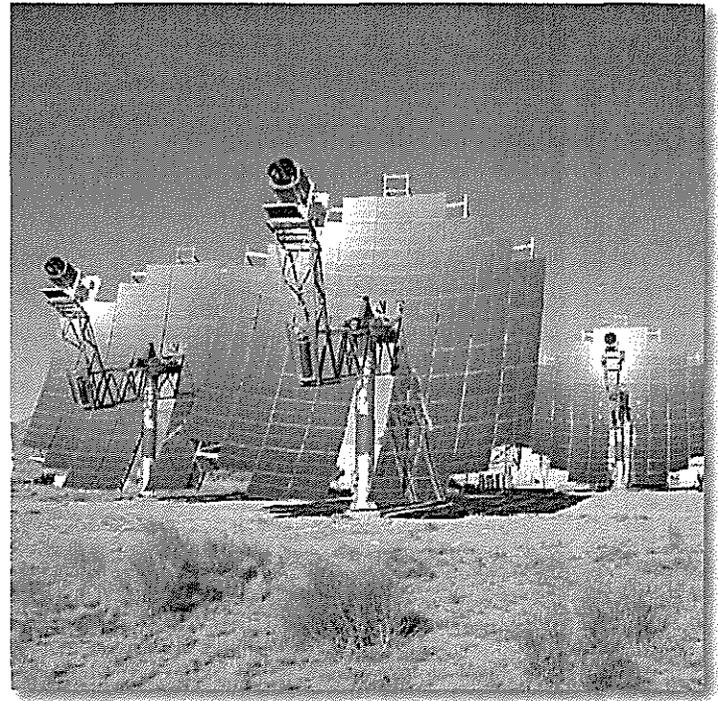

- El Proyecto sería construido en dos fases.
Fase I = 12.000 de los SunCatchers (300 megavatios)
Fase II = añadir otros 18.000 de los SunCatchers (450 megavatios)
- Suponiendo la aprobación de todos los permisos, construcción empezaría en 2010 con el comienzo de operaciones comerciales proyectado por más tarde del año 2010.

Transmisión

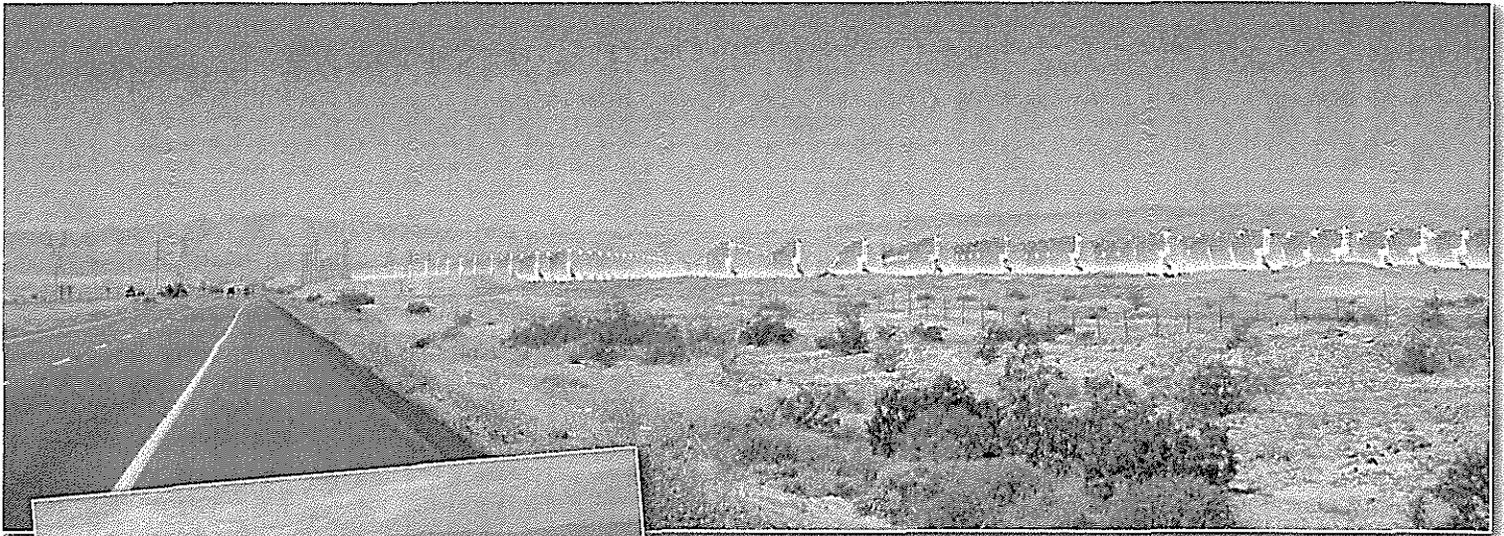

- Construcción de una nueva subestación de 230 Kilovoltios ubicada en el centro del sitio del proyecto.
- Interconectado a la Subestación Valle Imperial de SDG&E.

UBICACIÓN DEL SOLAR DOS

- Ubicado en aproximadamente 6.140 acres de tierra del gobierno federal administrado por el Bureau de la Administración de Tierra (BLM) y en 360 acres de tierra privada.
- Se ubicó el Proyecto para evitar o minimizar los impactos a la recreación y a áreas de medio ambiente sensible.

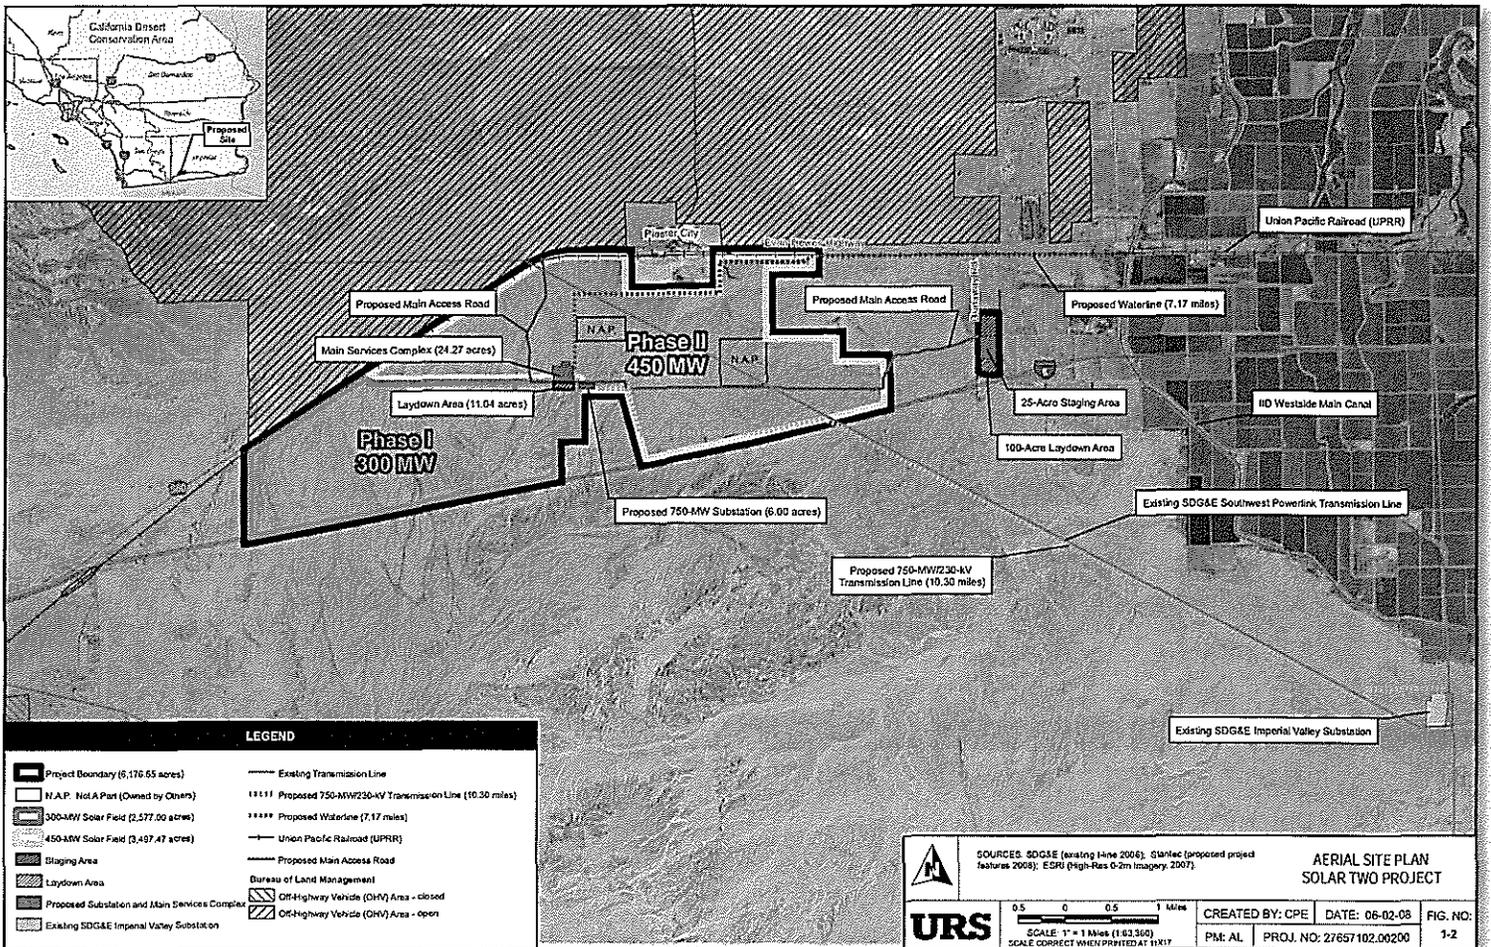

SIMULACIONES VISUALES SOLAR DOS

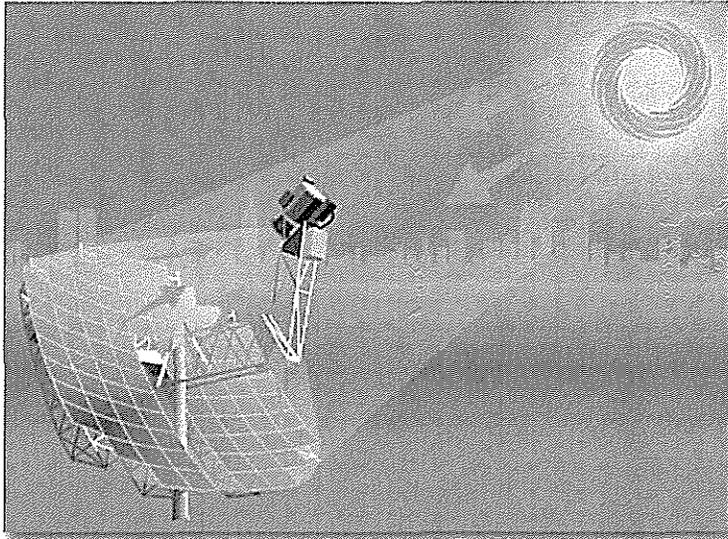

Arriba: Vista de la calle

A la izquierda: Vista del aire

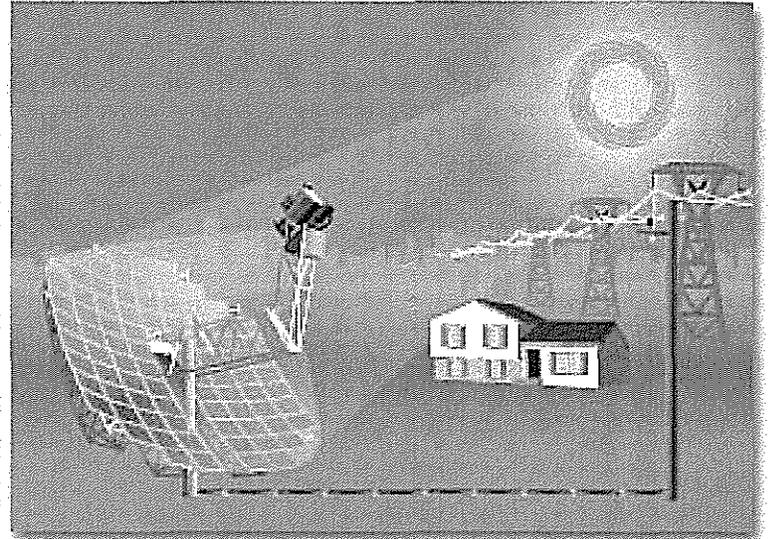

Abajo: Plano del Sitio del Proyecto

PROCESO DEL PROYECTO SOLAR DOS (COMO FUNCIONA)

Parabólica concentrador sigue, junta, y concentra la energía del sol.

Motor Stirling convierte la energía a electricidad de calidad para red eléctrica.

BENEFICIOS DEL PROYECTO SOLAR DOS

- Solar Dos desarrollaría energía solar renovable para ayudar el estado de California a realizar su requisito al RPS y a lograr su meta para reducir las emisiones de gases invernaderos a los niveles del año 1990 por el año 2020.
- Solar Dos crearía unos 160 trabajos permanentes de supervisor general, administrativos, de construcción, de operaciones y del mantenimiento.
- Construcción del Proyecto Solar Dos aumentaría ingresos por medio de impuestos de venta, construcción, y actividades económicas de los empleados de las operaciones.
- Solar Dos proveería aproximadamente \$60.000.000 (dólares del año 2008) de nómina de la construcción, con un medio de población activa de 360 empleados.
- Beneficios educacionales – se supone que los estudiantes de escuelas y universidades locales estudiarían el Proyecto como modelo de aumentación del desarrollo y la tecnología de energía renovable.
- Se espera también aumentos potenciales del turismo.

SCOPING MEETING DISPLAY BOARDS

This appendix contains the following:

- Display Boards in English (10 pages)
- Display Boards in Spanish (10 pages)

Welcome!

Data Response and Issues Resolution Workshop /Scoping Meeting for the Solar Two Project

(08-AFC-5)/(CA-670-2006-33)

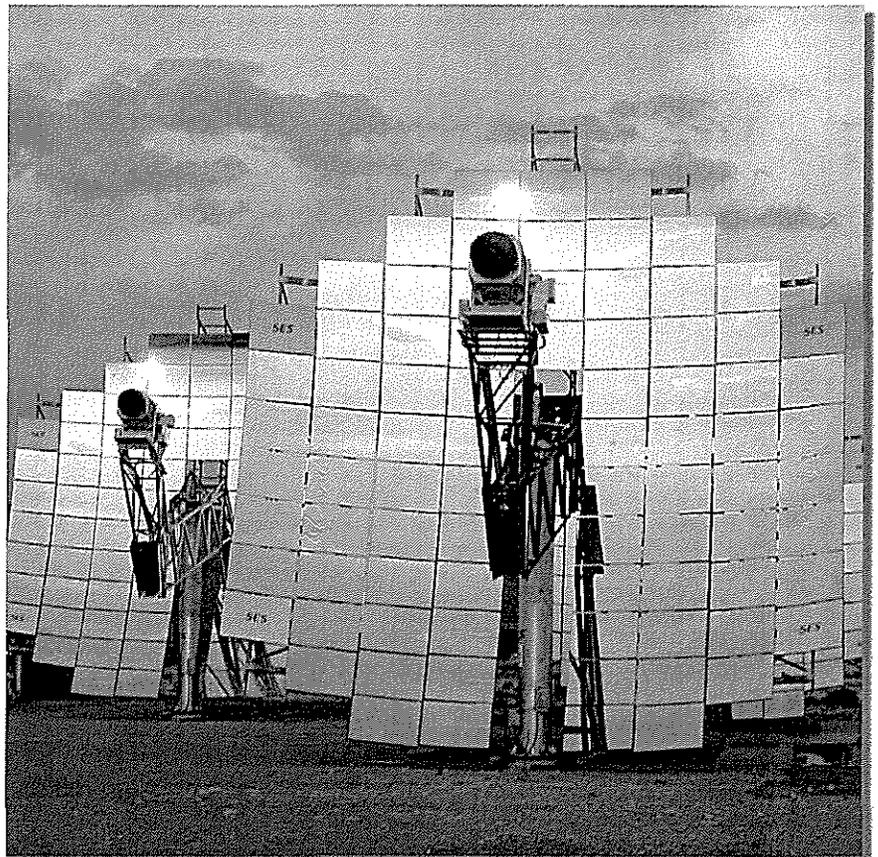

Monday, December 18, 2008

- 1:00 pm - 4:00 pm: Workshop
- 4:00 pm - 5:00 pm: Break (time permitting)
- 5:00 pm - 7:00 pm: Public Comments/
BLM Scoping

ABOUT STIRLING ENERGY SYSTEMS

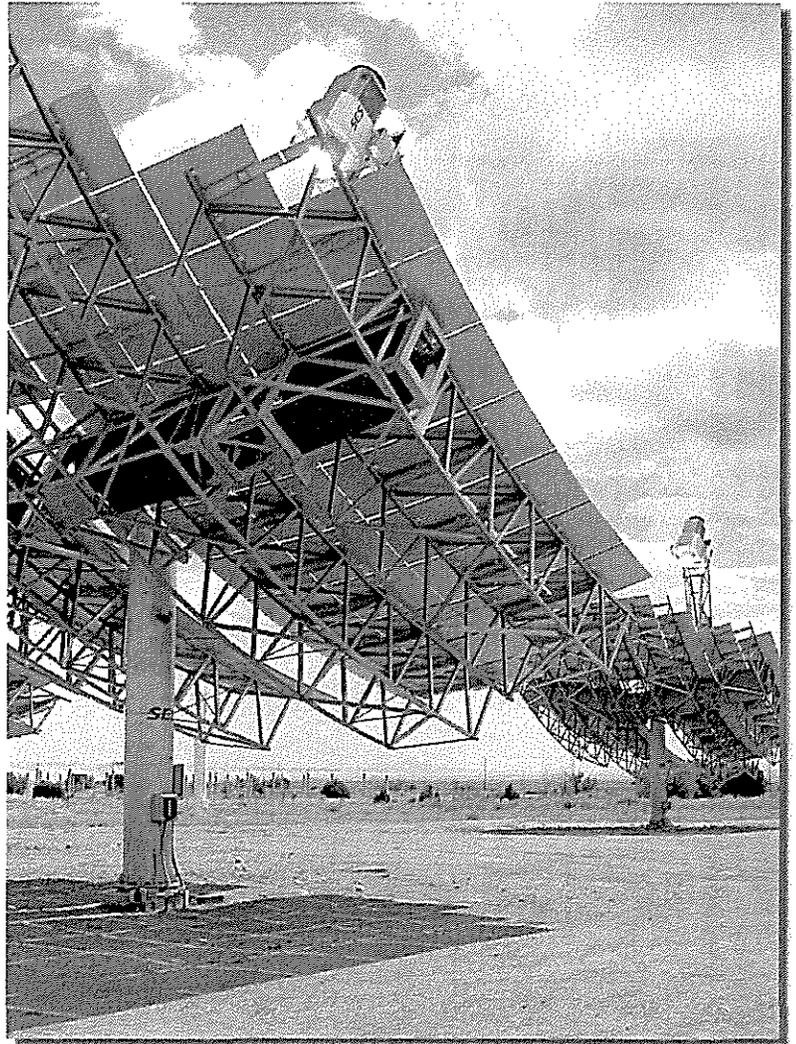

- Unique SunCatcher technology that combines a mirrored concentrator dish with a high-efficiency Stirling engine specially designed to convert sunlight to electricity.
- Technology on the ground since 1984.
- Holds World Record in efficiency of converting the sun's energy into grid-quality electricity.
- A United States Company Headquartered in Phoenix, Arizona:
 - Project & technical development offices are located in Tustin, California and Albuquerque, New Mexico.
- Renewable utility grade power ready for commercialization.

SOLAR TWO PROJECT PURPOSE

- Provide up to 750MW of renewable electric capacity under a 20-year Power Purchase Agreement (PPA) to San Diego Gas & Electric (SDG&E).
- Develop renewable solar energy to help California achieve its Renewables Portfolio Standard (RPS) requirement.
- Help protect the environment by delivering clean, renewable solar energy.
- Assist the State of California in meeting its goal of reducing greenhouse gas emissions to 1990 levels by 2020 (Assembly Bill 32).

SOLAR TWO PROJECT DESCRIPTION

PROJECT SIZE/LOCATION

- One of the world's largest solar power projects.
- 750 net megawatt (MW) solar power project in Imperial Valley, California.
 - Approximately 100 miles east of San Diego, 14 miles west of El Centro, and 4 miles east of Ocotillo.

TECHNOLOGY

- Solar Two would consist of:
 - Approximately 30,000 solar dish Stirling systems (referred to as SunCatchers) which would consist of solar concentrating dishes and Stirling Engine Power Conversion Units (PCUs).
 - Associated equipment and support systems.

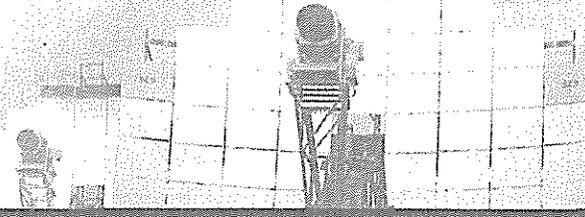

CONSTRUCTION

- The Project would be constructed in two phases. Phase I would consist of up to 12,000 SunCatchers and produce a net 300MW. Phase II would expand the Project with 18,000 SunCatchers and produce a net 450MW.
- Subject to receipt of all necessary approvals, construction should start in 2010, with projected commercial operations beginning later that year.

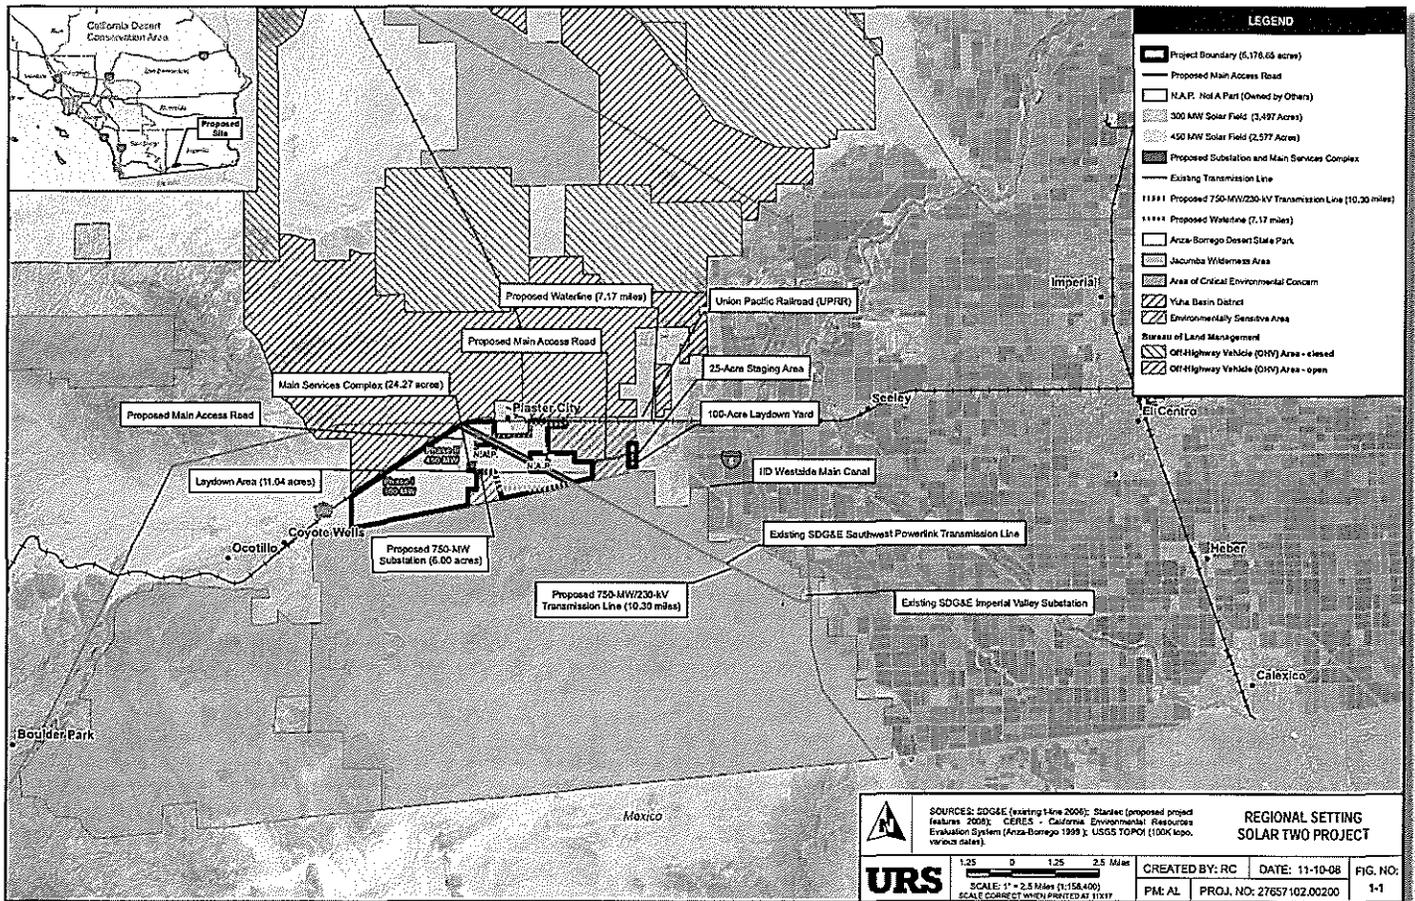

TRANSMISSION

- Construction of a new 230kV substation located in the center of the Project Site.
- Interconnection to the SDG&E Imperial Valley Substation.

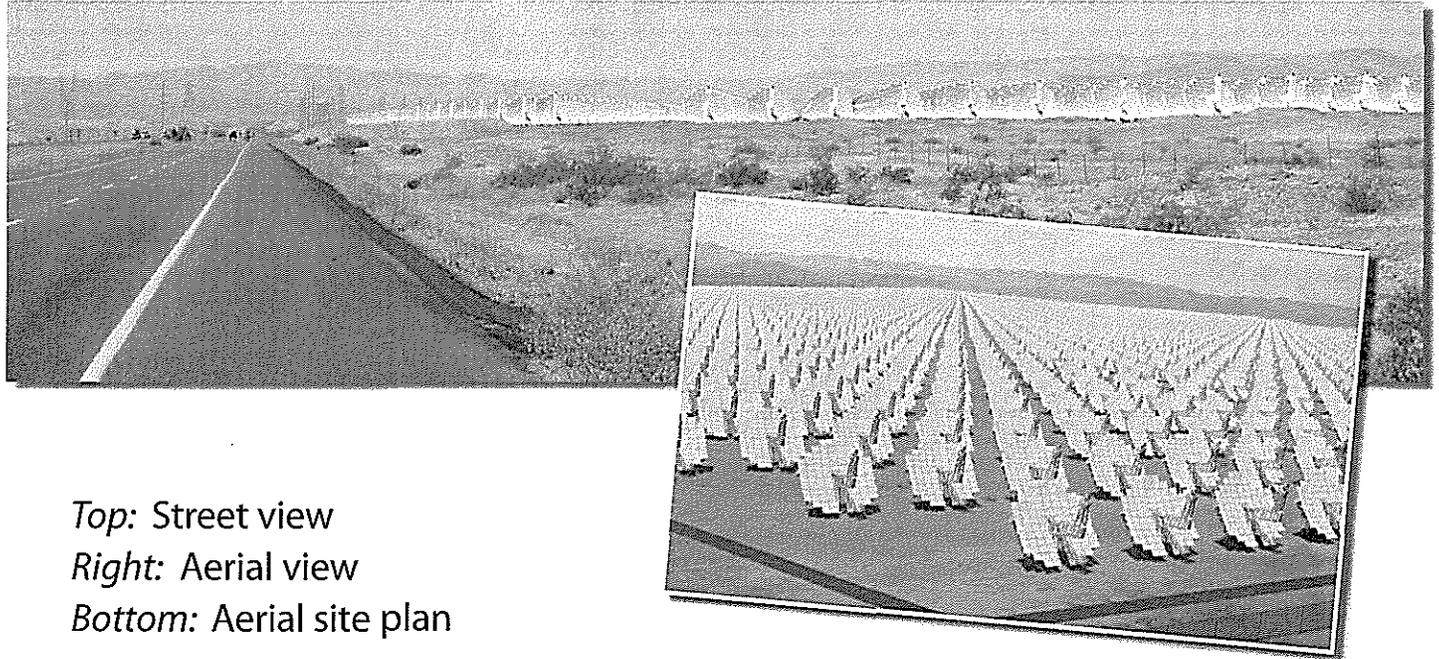

SOLAR TWO SITE LOCATION

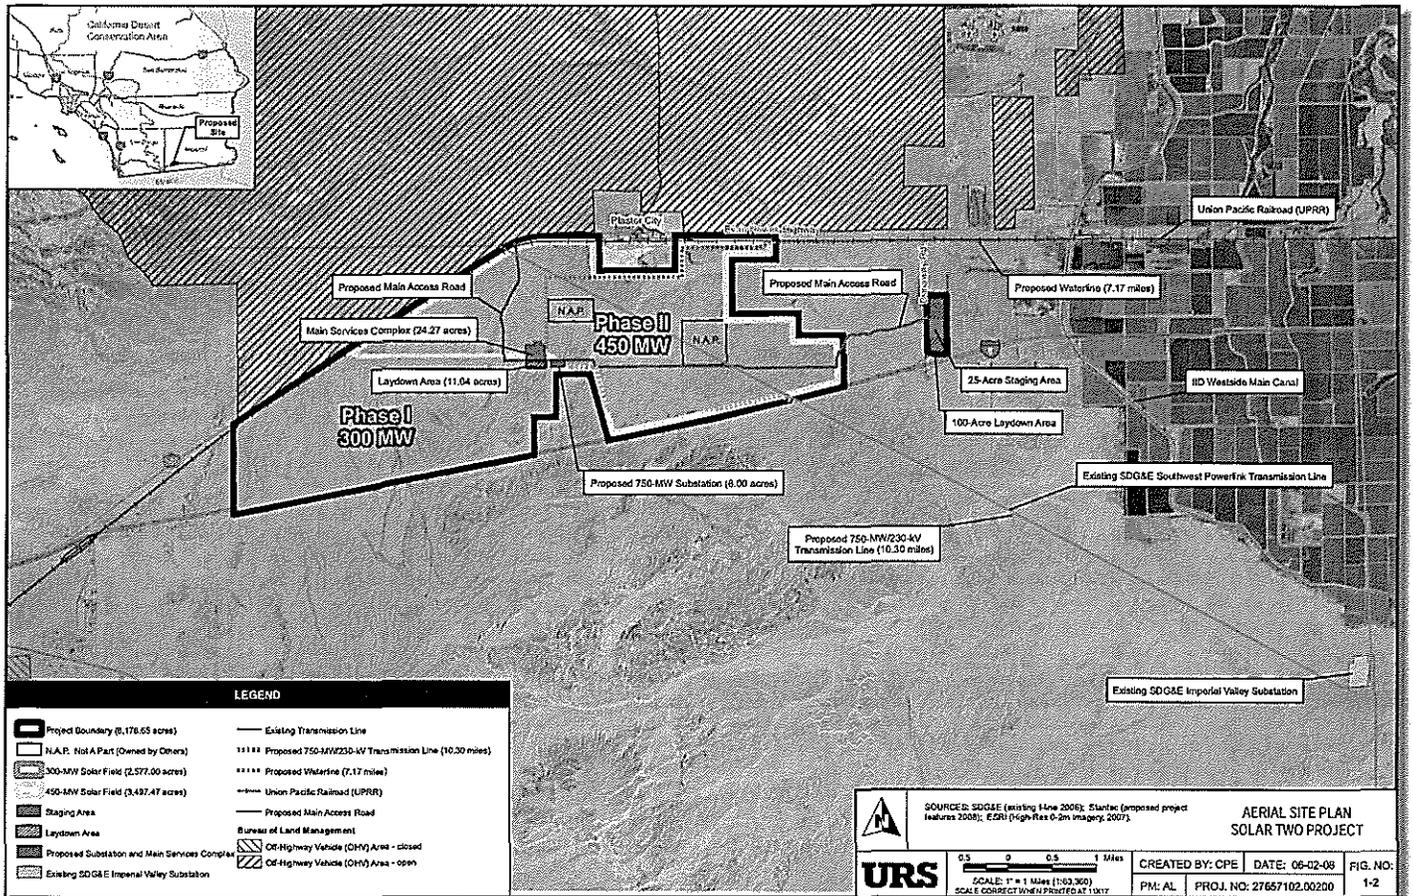

- Located on approximately 6,140 acres of federal land administered by the Bureau of Land Management (BLM) and 360 acres of private land.
- The Project was sited to avoid or minimize impacts to recreation and environmentally-sensitive areas.

SOLAR TWO VISUAL SIMULATIONS

SOLAR TWO

PROJECTED PROJECT SCHEDULE

2008

2008 – 2nd Quarter

File Application for Certification

2009

2009 – 4th Quarter

Receive Certification

2010

2010 – 1st Quarter

Begin Construction

– 3rd Quarter, Phase I

First Units Online

2012

2012 – 2nd Quarter, Phase II

First Units Online

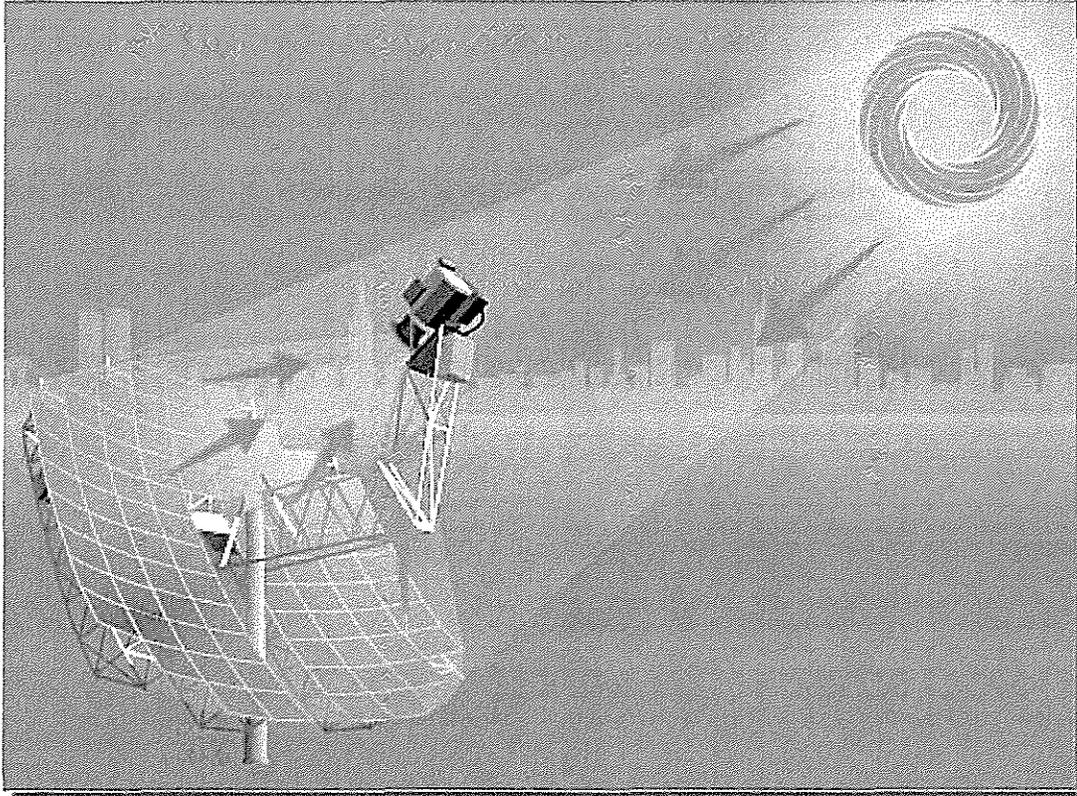

2014

2014 – 4th Quarter

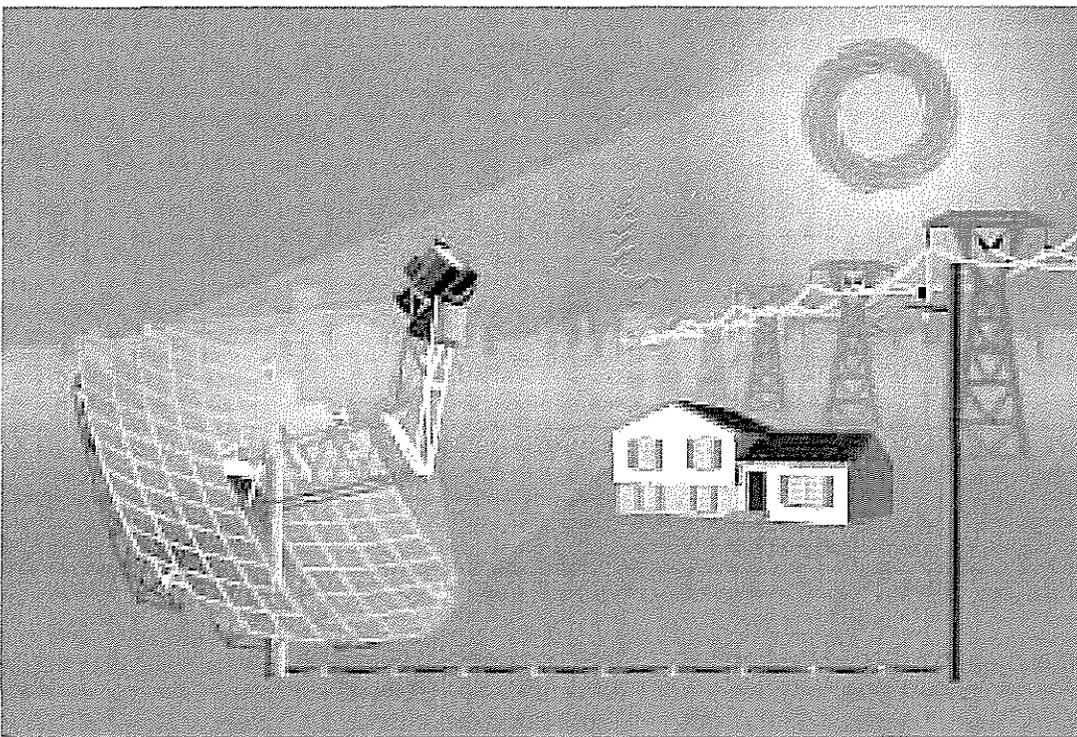

Completion of 750MW

Project Construction

SOLAR TWO PROJECT PROCESS (HOW IT WORKS)

**Dish
concentrator
tracks, collects,
and focuses the
sun's energy.**

**Stirling engine
converts
energy to
grid-quality
electricity.**

RESOURCE AREAS

Solar Two will adhere to all local, state and federal laws, ordinances, regulations and standards (LORS).

CULTURAL RESOURCES

- Extensive archaeological and historic architecture pedestrian surveys were conducted to identify and avoid potential adverse cultural effects of the Project.

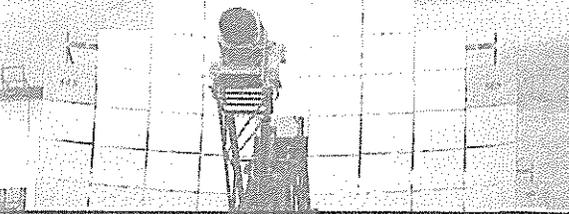

VISUAL RESOURCES

- Visual survey conducted including the preparation of visual simulations from various locations.
- Visual character of the area would change.

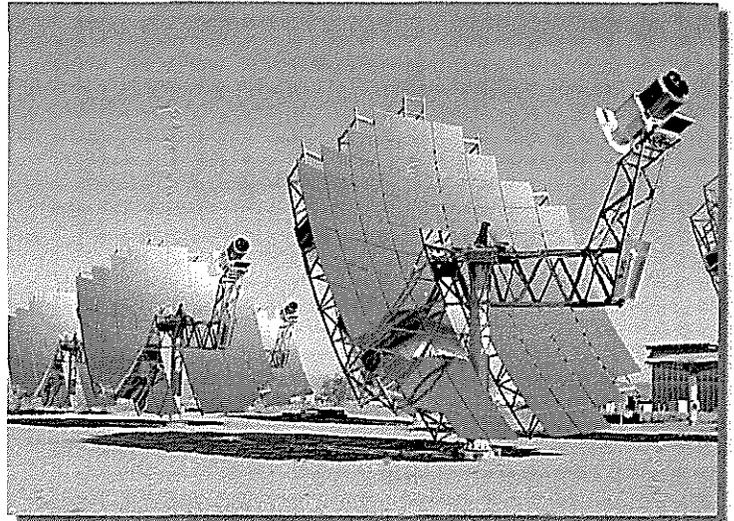

LAND USE

- Project Site was intentionally chosen to avoid impacts to recreational land uses.
- BLM would require the approval of a Land Use Amendment and issuance of a right-of-way grant.

SOLAR TWO PROJECT BENEFITS

- Solar Two would develop renewable solar energy to help California achieve its RPS requirement and assist in meeting its goal of reducing greenhouse gas emissions to 1990 levels by 2020.
- The Project would introduce approximately 160 permanent jobs in the supervisory, administrative, construction, operations and maintenance fields.
- Construction of Solar Two would lead to increased revenue from sales taxes, due to construction and operational employees' economic activities.
- Solar Two would provide approximately \$60,000,000 (in 2008 dollars) in construction payroll with an average monthly construction workforce of approximately 360 jobs.
- Educational benefits – students from local schools and colleges are expected to study the Project as a model for future growth in the renewable energy development and technology.
- Potential boosts to tourism are also anticipated.

Bienvenidos

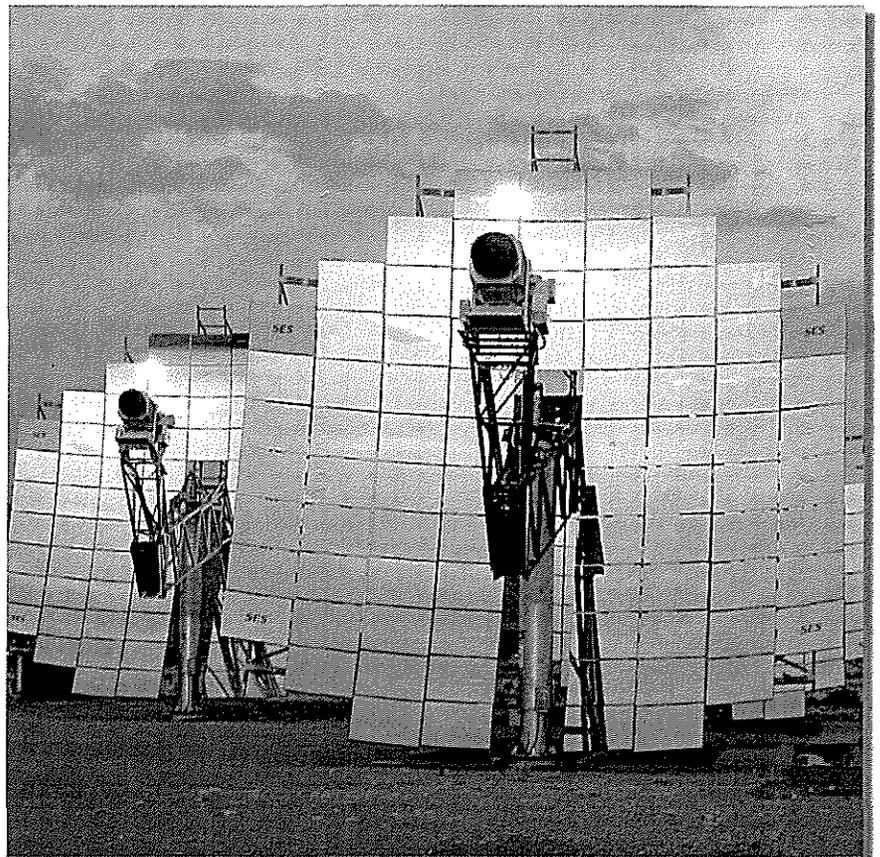

Taller de Reacción a Datos y Resolución de Asuntos/Conferencia Interactiva Sobre el Proyecto Solar Dos (08-AFC-5) / (CA-670-2006-33)

Lunes, 18 de diciembre 2008

- **1:00 - 4:00 de la tarde: Taller**
- **4:00 - 5:00 de la tarde: Descanso
(si queda tiempo)**
- **5:00 - 7:00 de la tarde: Comentarios del Público/Presentación del BLM**

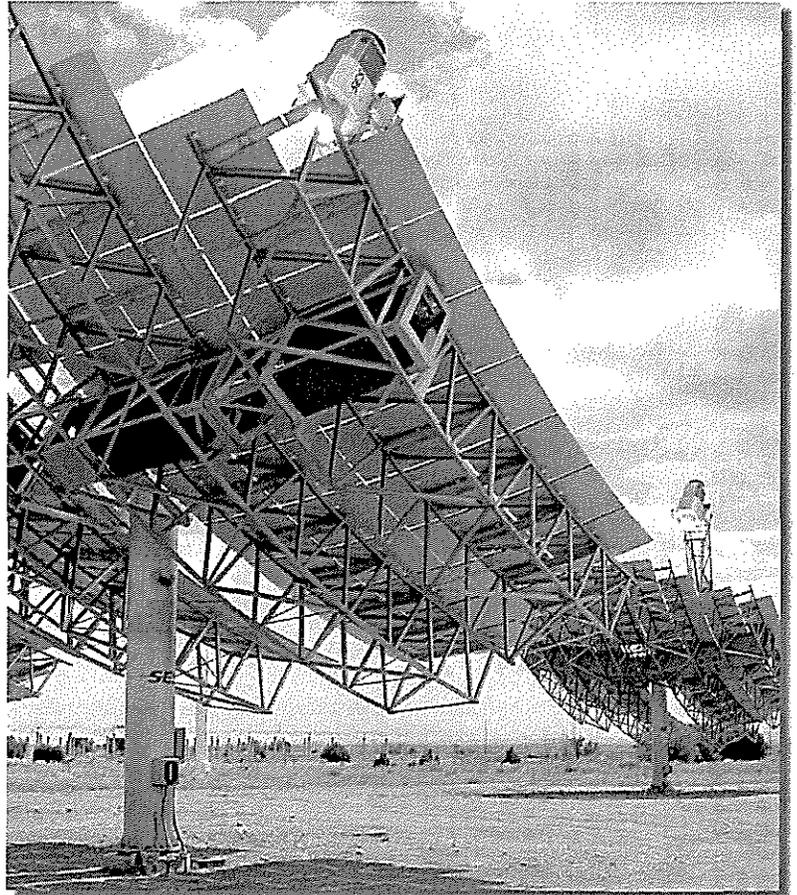

SOBRE LA COMPAÑÍA STIRLING ENERGY SYSTEMS

- Tecnología exclusiva de SunCatcher que combina una parabólica concentrador de espejos con un motor Stirling de gran rendimiento específicamente diseñado para convertir la luz solar en electricidad.
- Tecnología usado desde el año 1984.
- Posee el récord mundial en eficiencia para la conversión de energía solar en electricidad de calidad para red eléctrica.
- Compañía de los E.E.U.U. con sede en Phoenix, Arizona.
 - Oficinas para proyecto y desarrollo técnico ubicadas en Tustin, California y en Albuquerque, Nuevo México.
- Energía renovable de grado de servicios públicos lista para comercialización.

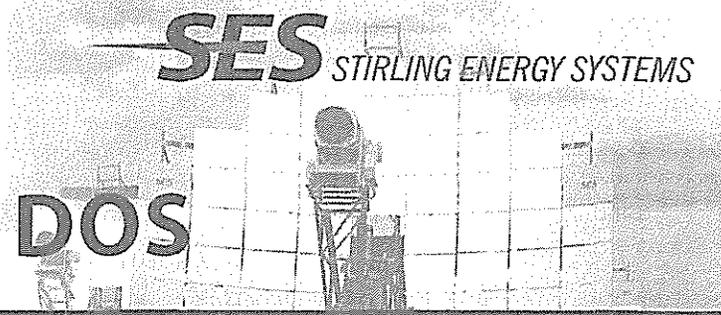

PROPÓSITO DEL PROYECTO SOLAR DOS

- Proveer hasta 750 megavatios de capacidad de electricidad renovable, en conformidad con un acuerdo de 20 años de compra de energía con San Diego Gas y Energía Eléctrica.
- Desarrollar energía solar renovable para ayudar al estado de California a realizar su requisito a Criterio de Portafolio Renovable (RPS).
- Ayudar a proteger el medio ambiente al proveer energía solar limpia y renovable.
- Ayudar al estado de California a lograr su meta para reducir las emisiones de gases invernaderos a los niveles del año 1990 por el año 2020 (Proyecto de Ley Número 32 de la Asamblea).

DESCRIPCIÓN DEL PROYECTO SOLAR DOS

TAMAÑO DEL PROYECTO/UBICACIÓN

- Uno de los proyectos de energía solar más grandes del mundo.
- Proyecto de energía solar de 750 megavatios (cantidad neta) en el Valle Imperial de California.
 - Aproximadamente 100 millas al este de San Diego, 14 millas al oeste de El Centro, y 4 millas al este de Ocotillo

TECNOLOGÍA

- Solar Dos consistiría de:
 - Aproximadamente 30.000 SunCatchers y Unidades de Conversación de Energía Motor Solar Stirling.
 - Equipo y sistemas de apoyo asociados.

CONSTRUCCIÓN

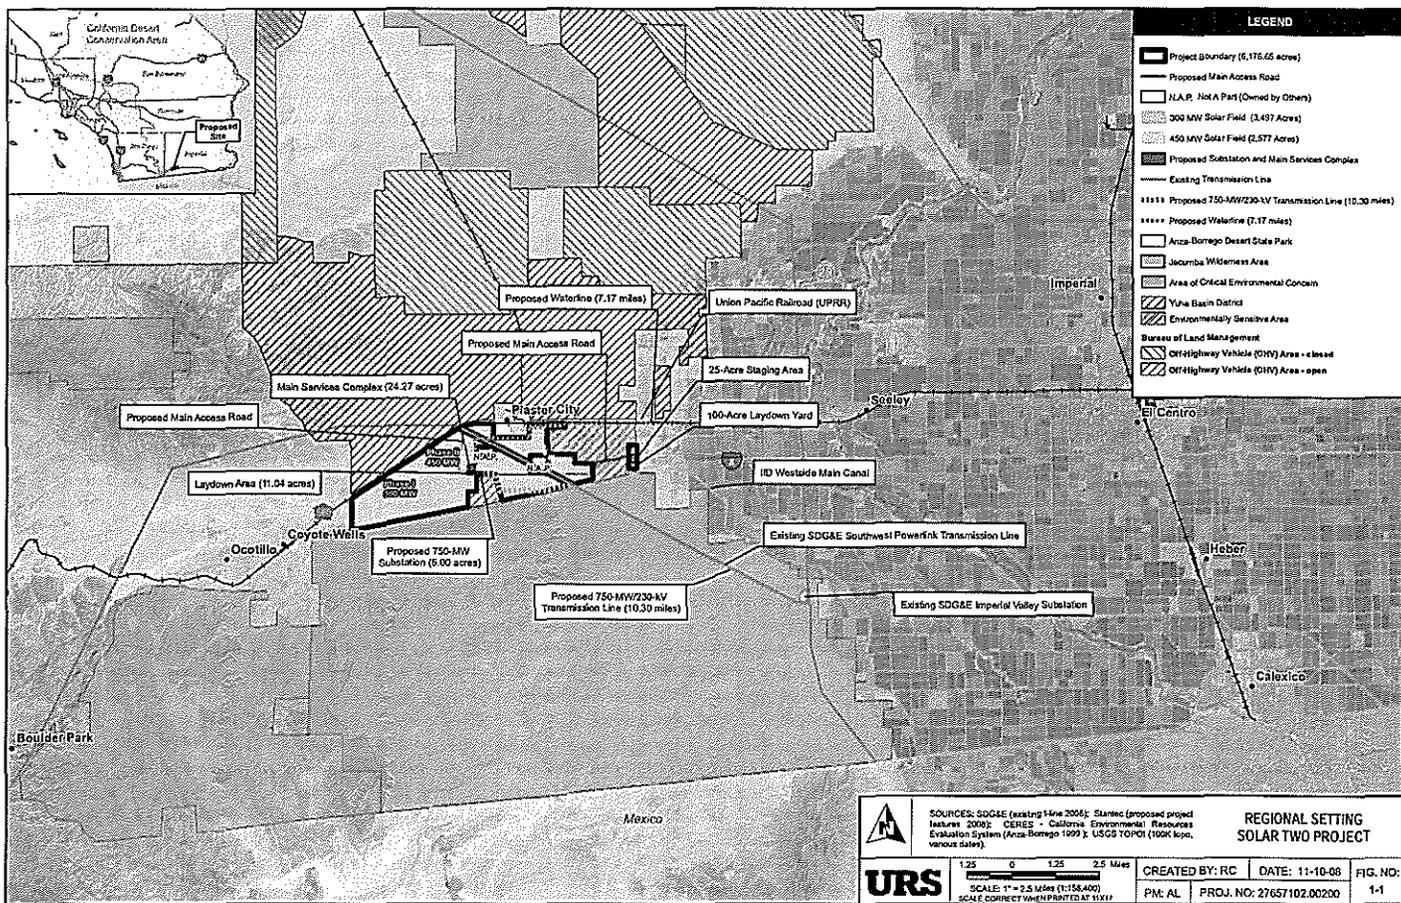

- El Proyecto sería construido en dos fases. Fase I = 12.000 de los SunCatchers (300 megavatios). Fase II = añadir otros 18.000 de los SunCatchers (450 megavatios) .
- Suponiendo la aprobación de todos los permisos, construcción empezaría en 2010 con el comienzo de operaciones comerciales proyectado por más tarde del año 2010.

TRANSMISIÓN

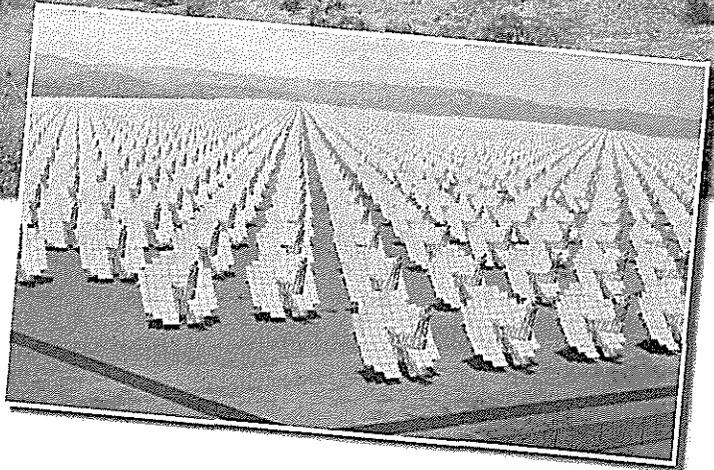

- Construcción de una nueva subestación de 230 Kilovoltios ubicada en el centro del sitio del proyecto.
- Interconectado a la Subestación Valle Imperial de SDG&E.

UBICACIÓN DEL SOLAR DOS

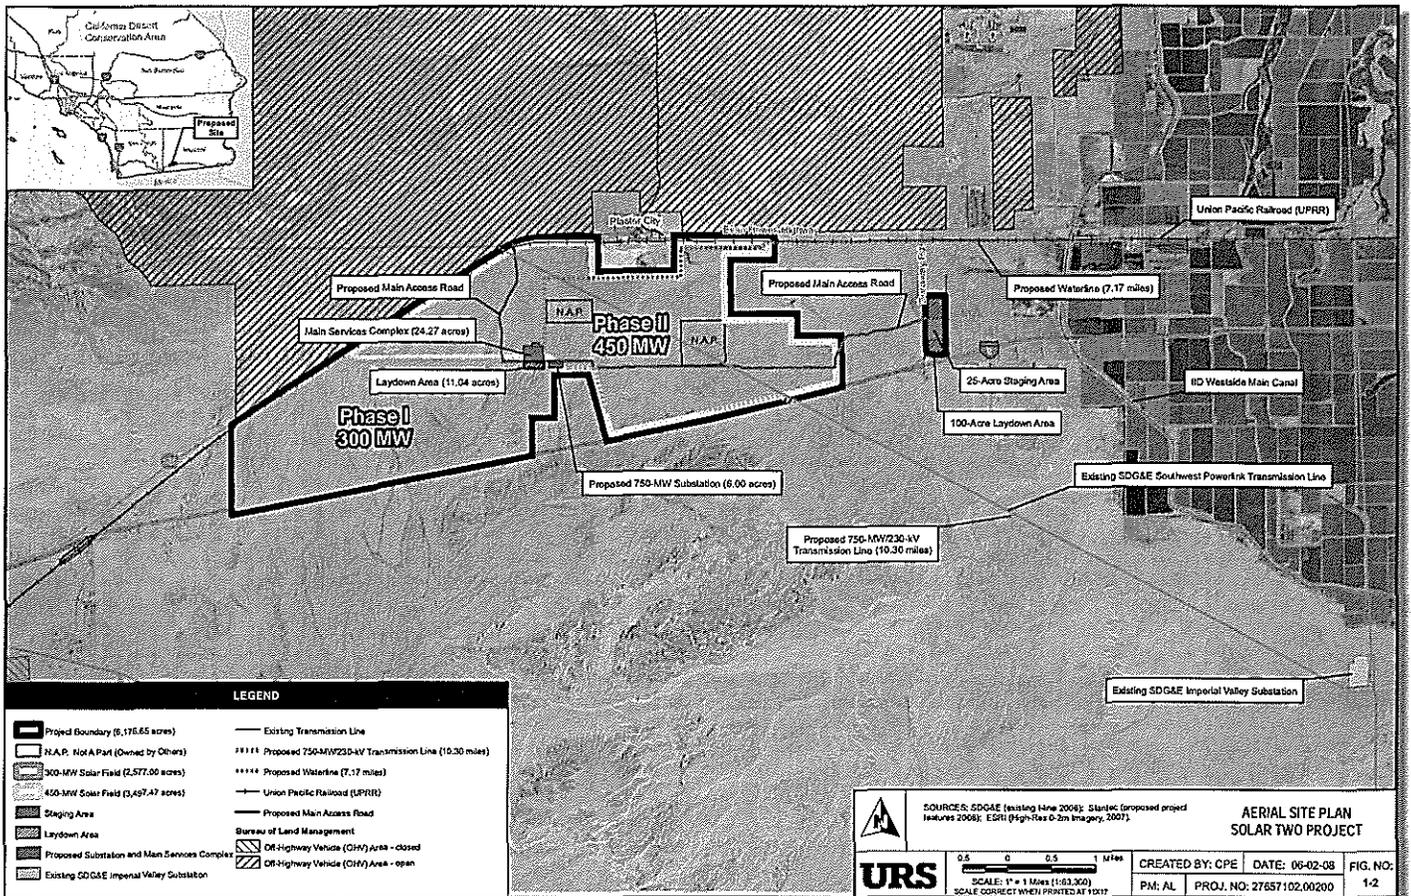

- Ubicado en aproximadamente 6.140 acres de tierra del gobierno federal administrado por el Bureau de la Administración de Tierra (BLM) y en 360 acres de tierra privada.
- Se ubicó el Proyecto para evitar o minimizar los impactos a la recreación y a áreas de medio ambiente sensible.

SIMULACIONES VISUALES SOLAR DOS

Primeros Elementos en
Funcionamiento

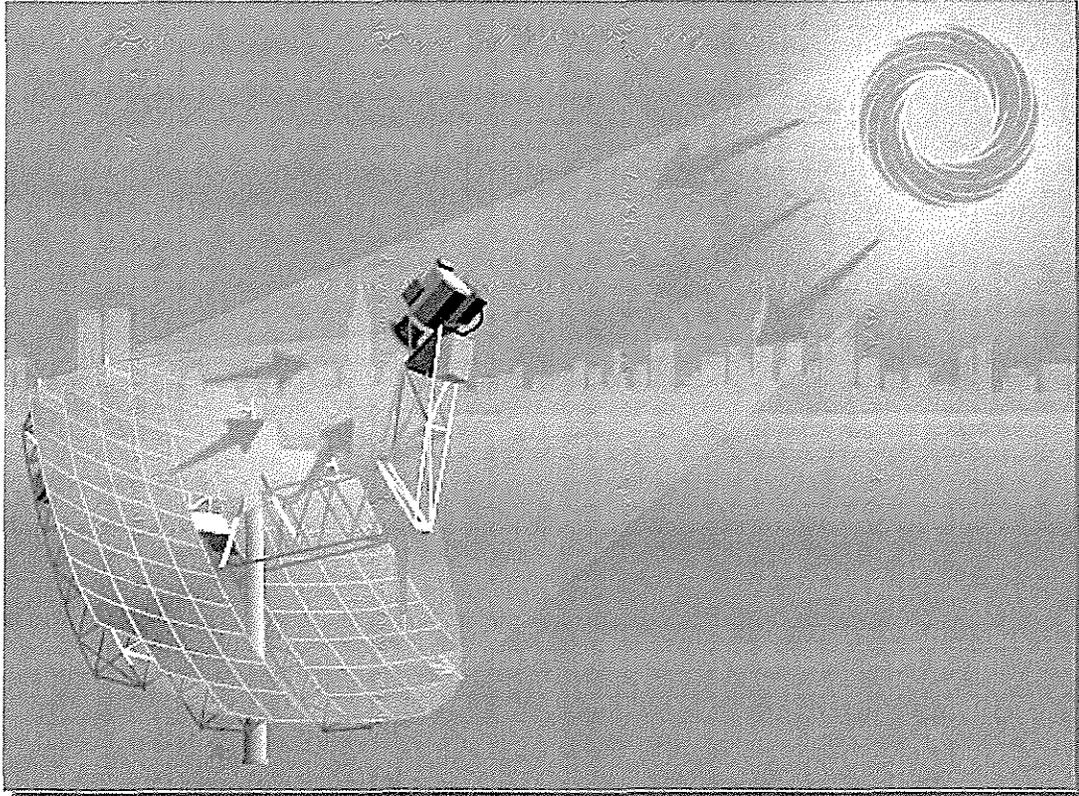

2012

2012 – Segundo Trimestre, Fase II
Primeros Elementos en
Funcionamiento

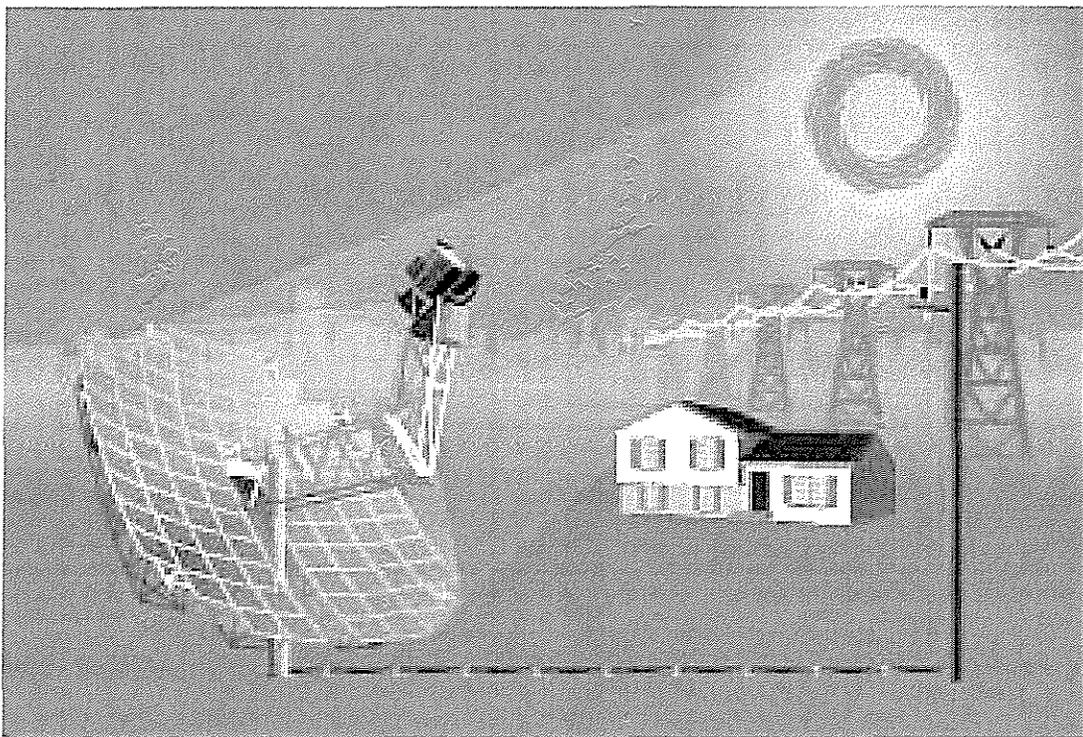

2014

2014 – Cuarto Trimestre,
Terminación de Construcción
del Proyecto de 750 Megavatios

PROCESO DEL PROYECTO SOLAR DOS (COMO FUNCIONA)

**Parabólica
concentrador
sigue, junta, y
concentra la
energía del sol.**

**Motor Stirling
convierte
la energía a
electricidad de
calidad para
red eléctrica.**

RECURSOS

Solar Dos va cumplir con todas las leyes pertinentes federales, del estado, y locales.

RECURSOS CULTURALES

- Estudios extensos arqueológicos y de la arquitectura histórica fueron conducidos a pie para identificar y evitar impactos adversos del Proyecto a los recursos culturales.

RECURSOS VISUALES

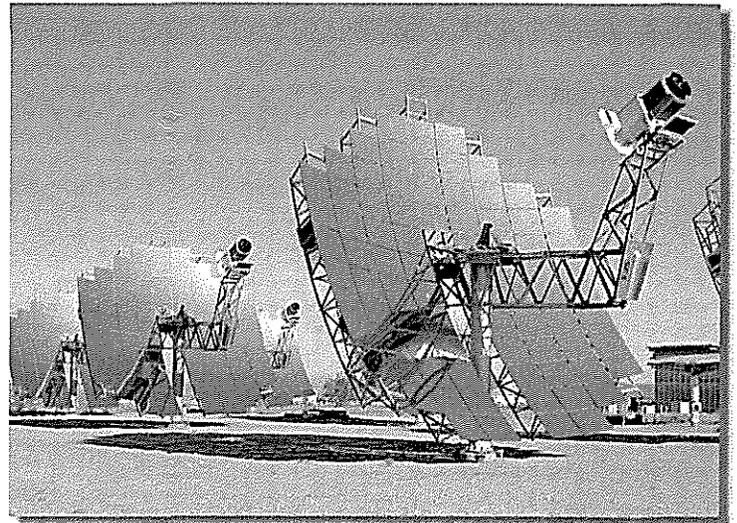

- Estudio visual fue conducido, incluyendo la preparación de simulaciones visuales de varios puntos de vista.
- El carácter del área cambiaría.

USOS DE LA TIERRA

- El sitio del Proyecto fue escogido específicamente para evitar impactos adversos a los usos recreativos de la tierra.
- BLM requeriría la aprobación de una Enmienda a los Usos de la Tierra y la facilitación de un derecho de paso.

BENEFICIOS DEL PROYECTO SOLAR DOS

- Solar Dos desarrollaría energía solar renovable para ayudar el estado de California a realizar su requisito al RPS y a lograr su meta para reducir las emisiones de gases invernaderos a los niveles del año 1990 por el año 2020.
- Solar Dos crearía unos 160 trabajos permanentes de supervisor general, administrativos, de construcción, de operaciones y del mantenimiento.
- Construcción del Proyecto Solar Dos aumentaría ingresos por medio de impuestos de venta, construcción, y actividades económicas de los empleados de las operaciones.
- Solar Dos proveería aproximadamente \$60.000.000 (dólares del año 2008) de nómina de la construcción, con un medio de población activa de 360 empleados.
- Beneficios educacionales – se supone que los estudiantes de escuelas y universidades locales estudiarían el Proyecto como modelo de aumentación del desarrollo y la tecnología de energía renovable.
- Se espera también aumentos potenciales del turismo.

APPENDIX J

PRESENTATION MADE AT THE NOVEMBER 24, 2008, SCOPING MEETING AND THE DECEMBER 18, 2008, WORKSHOP/SCOPING MEETING

**BUREAU OF LAND MANAGEMENT
and
CALIFORNIA ENERGY COMMISSION**

**Stirling Energy Systems Solar Two Project
Application for Certification
Stirling Energy Systems Solar Two, LLC
08-AFC-5**

**DATA RESPONSE AND ISSUES
RESOLUTION WORKSHOP
&
SCOPING MEETING
BLM Rights-of-Way Application CACA-47740
December 18, 2008**

Christopher Meyer, CEC Project Manager
Jim Stobaugh, BLM Project Manager

BLM's Role

- **BLM Permitting Authority**
 - ❖ Administration of public lands under Federal Land Policy and Management Act (FLPMA)
 - ❖ Review of land use planning and processing of Land Use Plan Amendment
 - ❖ California Desert Conservation Area Plan (1980)
 - ❖ Issuance of right-of-way grants for use of federal land
 - ❖ Lead federal agency for National Environmental Protection Act (NEPA), National Historic Preservation Act, and other federal law compliance

Energy Commission's Role

- **Energy Commission permitting authority**
 - ❖ Thermal power plants 50 megawatts or greater
 - ❖ Related facilities
 - transmission lines
 - substations
 - water supply systems
 - natural gas pipelines
 - waste disposal facilities
 - access roads
 - ❖ Lead state agency for California Environmental Quality Act (CEQA)

Local, State and Federal Coordination

- ❖ BLM and Energy Commission Staff work closely with local, state and federal agencies, for example:
 - Local: City or Township, if any
 - Regional: Imperial County
 - State: Department of Fish and Game, Regional Water Quality Control Board, Office of Historic Preservation, Native American Heritage Commission
 - Federal: Environmental Protection Agency, Fish and Wildlife Service, and National Parks Service

Overview of Licensing Process

1. Data Adequacy
 - Minimum requirements to accept application
2. Staff Discovery and Analyses
 - Data requests
 - Issues Identification
 - Public Workshops
 - Preliminary and Final Staff Assessments
3. Committee Evidentiary Hearing and Decision
 - Evidentiary Hearings on FSA and other information
 - Presiding Member's Proposed Decision (PMPD)
 - PMPD hearing and Commission decision

Discovery and Analysis Process

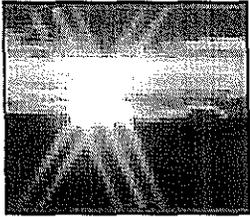

- ❖ Determine if proposal complies with Laws, Ordinances, Regulations, Standards (LORS)
- ❖ Conduct engineering and environmental analysis
 - ❖ identify issues
 - ❖ evaluate alternatives
 - ❖ identify mitigation measures
 - ❖ recommend conditions of certification
- ❖ Facilitate public and agency participation
- ❖ Staff products: Preliminary Staff Assessment (PSA) and Final Staff Assessment (FSA)
- ❖ Make recommendations to the Committee

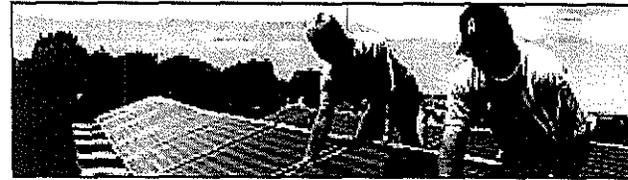

Evidentiary Hearing & Decision Process

- ❖ Committee conducts hearings on all information
 - Issues Presiding Member's Proposed Decision (PMPD)
 - PMPD contains findings relating to:
 - Environmental impacts, public health, engineering
 - Project's compliance with LORS
 - Recommends conditions of certification
 - Recommends whether or not to approve the project
- ❖ Full Commission makes decision
- ❖ Energy Commission monitors compliance with all conditions of certification, for the life of the project and closure

BLM Solar Energy Development Policy

- ❖ WO IM No. 2007-097 (April 4, 2007)
- ❖ Policy: facilitate environmentally responsible commercial development of solar energy projects on public lands.
- ❖ ROW applications for solar energy projects are a high priority and will be processed in a timely manner.
- ❖ If approved, authorize under Title V of FLPMA.
- ❖ Rent established by appraisal.
- ❖ Information on solar energy technology is available at: <http://www.eere.energy.gov/RE/solar.html> or <http://www.nrel.gov>.

■ Ref. Handout WO- IM No. 2007- 097

Summary of BLM ROW Processing and Administration

- BLM:
 - Regulations: 43 CFR 2800
 - Right-of-Way Toolkit Information:
 - ❖ General ROW
http://www.blm.gov/wo/st/en/prog/energy/cost_recovery_regulations.html
 - ❖ Solar ROW
http://www.blm.gov/wo/st/en/prog/energy/solar_energy.html

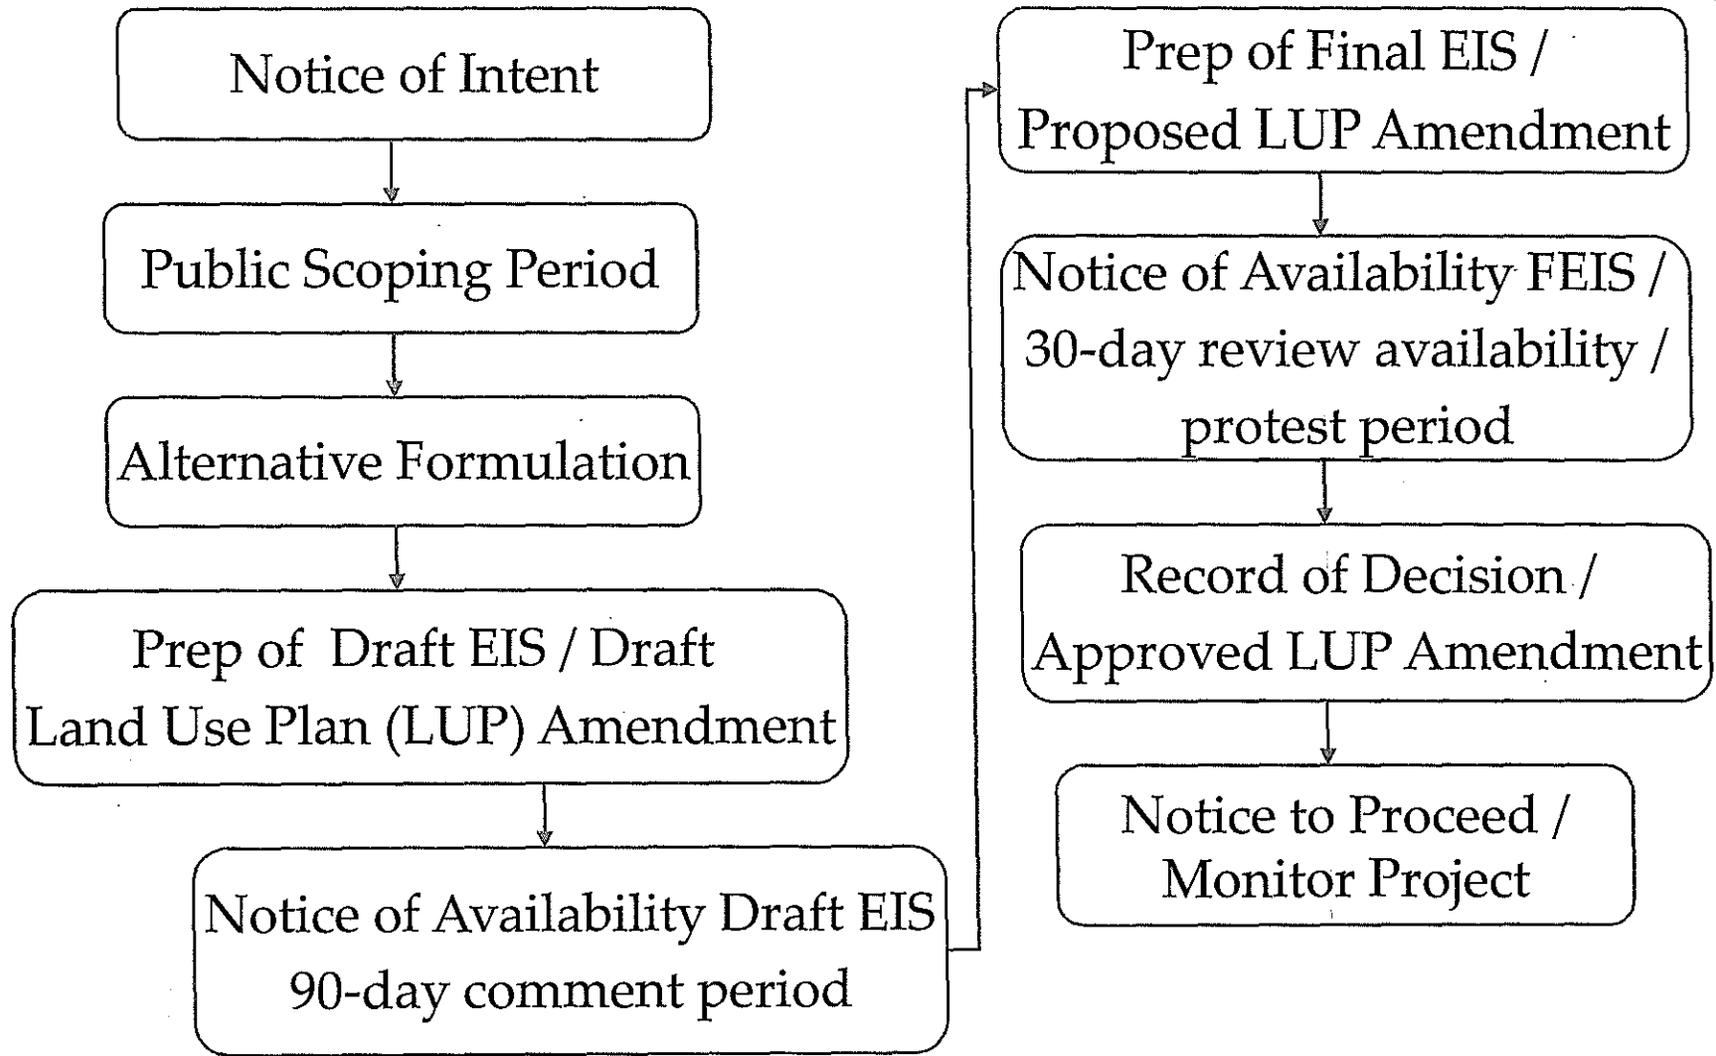

BLM Authorized Officer's Role

- ❖ Initial Response to Proposal
- ❖ Pre-application Screening
- ❖ Accept Application or Reject Proposal
- ❖ Process Application / Land Use Plan Amendment
- ❖ - Conduct Scoping
- ❖ - Prepare NEPA EIS document/LUP Amendment
- ❖ Decision on Application / Approve LUP Amendment
- ❖ Authorize the Use
- ❖ Administer through Termination

Land Use Plan

BLM NEPA EIS / LUP Amendment Process

Energy Commission Contacts and Web Site

- ❖ Committee Assigned
 - Jeffrey Byron, Commissioner, Presiding Member
 - Jackalyne Pfannenstiel, Chairman, Associate Member
- ❖ California Energy Commission Staff
 - Raoul Renaud, Commission's Hearing Officer
 - (916) 654-5103, e-mail: raoul.renaud@energy.state.ca.us
 - Christopher Meyer, Project Manager
 - (916) 653-1639 e-mail: christopher.meyer@energy.state.ca.us
 - Web page: www.energy.ca.gov/sitingcases/solartwo
 - Public Adviser's Office
 - (916) 654-4489 or (800) 822-6228
 - e-mail: PublicAdviser@energy.state.ca.us

BLM Contacts and Comment Web Site

- ❖ Jim Stobaugh, Project Manager
Phone: (775) 861-6478
e-mail: jim_stobaugh@blm.gov
- ❖ BLM Web Page:
<http://www.blm.gov/ca/st/en/fo/elcentro/nepa/stirling.html>
- ❖ Scoping comments to:
SES Solar Two Scoping Comments
c/o Christopher Meyer, Project Manager
California Energy Commission
1516 9th Street, MS-15
Sacramento, CA 95814-5512

Or email comments to:

christopher.meyer@energy.state.ca.us
(attention Solar Two)

Public Participation Information

- Open Public Process
 - ❖ Workshops and Hearings noticed at least 15 days in advance
 - ❖ Mailing lists
 - ❖ List Server: www.energy.ca.gov/listservers
- Documents are available for public review at:
 - ❖ Public Libraries in Imperial County, Eureka, Sacramento, San Francisco, Fresno, Los Angeles and San Diego
 - ❖ Energy Commission Library in Sacramento
 - ❖ Energy Commission Web site:
www.energy.ca.gov/sitingcases/solartwo
 - ❖ Dockets Unit at the Energy Commission
1516 9th Street, MS - 4
Sacramento, CA 95814-5512

Public Participation Opportunities

- ❖ Submit written comments or statements to the Commission
- ❖ Provide oral comments at public meetings
- ❖ Participate in workshops
- ❖ Become a formal intervenor (Contact Public Advisor's Office)
- ❖ Provide written comments on Scoping, the PSA/DEIS, FSA/FEIS and PMPD

Potential Issue Areas

SES Solar Two Project

- ❖ Cultural Resources
- ❖ Land Use
- ❖ Air Quality
- ❖ Visual Resources
- ❖ Cumulative Effects and Alternatives

Cultural Resources

Potential Issues

- ❖ High Frequency of Cultural Resources (number and density)
- ❖ Potential for Unanticipated Discoveries
- ❖ Mitigation of Potential Significant Impacts
- ❖ Cumulative Impacts

Land Use Potential Issues

- ❖ Exclusive use of 6,140 acres of public land could eliminate other BLM authorized land uses
- ❖ Land within the 360-acre portion of private land designated as Recreation/Open Space
- ❖ Cumulative Impacts

Air Quality Potential Issues

- ❖ Fugitive dust from construction and operation
- ❖ Vehicle emissions from operations

Visual Resources

Potential Issues

- ❖ New intrusions on the landscape from 30,000 SunCatchers on over 6,500 acres
- ❖ Development of VRM classification

Cumulative Effects and Alternatives Issues

- ❖ NEPA and CEQA requirements for analysis of the environmental impacts of the proposed project and other proposed projects in the desert would include a cumulative effects review of all proposed projects.
- ❖ Alternatives to a proposed project including no action.

2 2:03 p.m.

3 PRESIDING MEMBER BYRON: Welcome and
4 thank you for having us here. This is a wonderful
5 setting and venue to be able to conduct this
6 preliminary hearing.

7 Allow me to introduce myself. I'm Jeff
8 Byron; I'm a Commissioner at the California Energy
9 Commission, and I'm the Presiding Member on a
10 Committee for this project, the Stirling Energy
11 Systems Solar Two project. And with me is the
12 Chairman of our Commission, who is actually the
13 Associate Member on this Committee. And that's
14 Jackalyne Pfannenstiel. And I'll ask the Chairman
15 if she has some remarks in just a moment.

16 But if you'll indulge me for just a
17 second I'd just like to introduce what we're doing
18 here today in my own words. And then I'll turn it
19 over to our Hearing Officer. And we'll also go
20 around for other introductions so you'll have a
21 sense of everyone who's here.

22 As I said, we are a Committee of two.
23 There are five Commissioners at the California
24 Energy Commission. And many of you might already
25 know this. But what we're going to do here is

1 we're going to eventually make a recommendation to
2 the full Commission. And we're all independently
3 appointed Commissioners. We will make independent
4 decisions with regard to this case, as we do with
5 all the others. In a sense we're acting as judges
6 in this proceeding.

7 And it's not until after we've collected
8 all the evidence from the applicant, all the
9 analysis from our staff, who, by the way, will be
10 independent of us. We have no contact with them,
11 as our Hearing Officer will explain about the ex
12 parte rules.

13 And, of course, we're also -- there will
14 be intervenors in this case, and we're also very
15 interested in what the public has to say. And
16 that's why we're here.

17 The Commissioners maintain no contact at
18 any time with the parties in this case except in
19 publicly noticed meetings such as this.

20 So, the Hearing Officer is Mr. Raoul
21 Renaud to my right. He'll conduct the proceeding.
22 And he's also the point of contact as we go
23 forward on any procedural issues that come up.

24 I was going to just mention briefly, as
25 well, and we'll go into more detail on all of

1 these, this normally when we get an application
2 before the California Energy Commission we try and
3 get through this process within a year's time.

4 This one's a little more complicated in
5 that a good deal of the land that's being proposed
6 by the applicant is under the jurisdiction of the
7 Bureau of Land Management. And so we're actually
8 conducting this case and this hearing today with
9 the BLM. And you'll meet those gentlemen shortly,
10 who I just met this morning, as well.

11 So we have to be cognizant of the fact
12 that we have state law involved here, as well as
13 federal law. And you'll learn more about all of
14 that as we go on.

15 The primary reason that we're meeting
16 here today is to explain the process that we go
17 through. And, of course, you'll have opportunity
18 to meet all the participants. But we're really
19 learning about the basics of the project today.
20 And we want to make sure that the public process
21 is explained.

22 We have our Public Adviser here today
23 and you'll get to hear from her, as well, so that
24 we not only make sure that the public is included,
25 but we encourage public participation in this

1 process. And that is Loreen McMahon, who's here,
2 all the way, I believe, to my left. You'll hear
3 from her shortly.

4 And we also have some elected officials
5 here today. Elected officials are extremely
6 important to this process because obviously many
7 of them represent your interests. I think I can
8 mention them now, certainly.

9 Is that -- and if you wouldn't mind,
10 because we look forward to seeing and meeting you,
11 as well, I have Mr. John Pierre Menvielle, the
12 President of the Imperial Irrigation District.
13 Did I say that correctly?

14 MR. MENVIELLE: Yes, sir.

15 PRESIDING MEMBER BYRON: Thank you.
16 Gary Wyatt, Chairman of the County Board of
17 Supervisors is here -- was here. Well, I hope he
18 returns.

19 And it looks like Mark T. Gran, and it
20 just says elected official. City of Imperial.
21 I'd like to welcome you very much; I hope we'll
22 have opportunity to hear from you this morning --
23 I'm sorry, this afternoon, as well.

24 Just by way of perspective, there are
25 about currently 24 siting cases like this before

1 the Commission right now. So, as you can imagine,
2 when we have committees of two of the
3 Commissioners, you can kind of see how that
4 workload divides out.

5 We take this very seriously at the
6 Commission. And what we're going to do here is go
7 through some preliminary process, introduce you to
8 the project. The applicant will be making a
9 presentation, as well as our staff.

10 And then we're going to take a bus ride,
11 as I understand it, around 3:30. And we'd really
12 like to try and hold to that schedule if we could
13 for a couple of reasons. One is to get there
14 before the sun sets. And the other is so that we
15 get home tonight in order to be back in Sacramento
16 for meetings tomorrow morning.

17 So, I'd like to thank you all for being
18 here and I appreciate your indulging me to just
19 kind of put my perspective on what we're all
20 about. And because our Chairman has been doing
21 this a lot longer than I have, I'd like to defer
22 to her and see if my Associate Member has any
23 comments.

24 ASSOCIATE MEMBER PFANNENSTIEL: Thank
25 you, Commissioner Byron. I just want to thank

1 everybody for hosting us for this preliminary
2 hearing today. It's really important for us to
3 get out into the community and hear from people
4 here on support or concerns or, you know, to let
5 us know. That's why we come out here, to hear
6 from you.

7 And so we appreciate the turnout. It's
8 important that there are people who both hear the
9 process and participate by going out and seeing
10 the site.

11 So, thank you for being here today.

12 PRESIDING MEMBER BYRON: Thank you,
13 Madam Chairman. So, I'm going to sit back and
14 turn our hearing over to Hearing Officer Mr.
15 Renaud.

16 HEARING OFFICER RENAUD: Thank you,
17 Commissioner Byron. And welcome, on my behalf, as
18 well. I think before we go any further let's get
19 introductions from the rest of the people who will
20 be making presentations today. We'll start with
21 the Energy Commission Staff, Chris Meyer. And if
22 you would perhaps introduce yourself and your
23 staff that you've brought with you.

24 MR. MEYER: Well, I'm Christopher Meyer;
25 I'll be the Project Manager for the Energy

1 Commission section of this. And as you've heard,
2 it's a joint process between the BLM and Energy
3 Commission.

4 I have actually several members of the
5 Energy Commission Staff here from Negar Vahidi
6 from land use, Susan Lee who will be working on
7 alternatives analysis. Also I have Keith Golden
8 from air quality, who's a senior, a lot of
9 experience in this, which will be very helpful.

10 Will Walters on air quality; Eric Knight
11 from the Energy Commission is an office manager
12 over the siting unit, who's in the back there. I
13 think I've gotten -- oh, and then Mary Dyas who
14 will speak a little later. She is the compliance
15 project manager assigned to this project.

16 PRESIDING MEMBER BYRON: Excuse me, Mr.
17 Meyers. Would all the Energy Commission Staff
18 please hold up your hands for just a few moments
19 so everybody can kind of see who you are. And
20 these folks are available if you'd like to talk to
21 them.

22 MR. MEYER: Yeah. And one last, Caryn
23 Holmes is staff attorney on this project. Thank
24 you.

25 HEARING OFFICER RENAUD: Okay, thank you

1 very much. Immediately to Commissioner Byron's
2 left is his Advisor, Kristy Chew; and to her left
3 is Commissioner Byron's other Advisor, Laurie ten
4 Hope.

5 And now I'd like to ask Loreen McMahon
6 to introduce herself, please.

7 MS. McMAHON: Hi, Loreen McMahon, the
8 Associate Public Adviser. I will have one of the
9 first presentations to explain the Public
10 Adviser's role and how we can help you be involved
11 in the process.

12 HEARING OFFICER RENAUD: Great, thank
13 you. And now, on behalf of the applicant, could
14 you give us some introductions, please.

15 MR. EGAN: Yes, thank you very much. My
16 name is John Egan; I'm a Senior Director for
17 Project Development for Stirling Energy. And with
18 me today I have quite a crowd.

19 Angela Leiba behind me, who is our
20 Project Manager, with URS Corporation. Corrine
21 Lytle, who is over here on my left. Seth Hopkins,
22 socioeconomics; Amy Gramlich, visual resources;
23 Matt Moore, water resources; Brian Glenn, cultural
24 resources; Theresa Miller, biological resources;
25 Emily Bierman, public involvement; Cheryl Rustin,

1 biological resources; and Sylvia Novoa is our
2 translator today, back in the back.

3 For Stirling Energy, myself, Allan
4 Thompson, our counsel, here on the left. Kevin
5 Harper, front row; he's our Project Manager of the
6 project here in the area. Christine Henning is
7 next to him. Ken Kostok, one of our engineers.
8 Ed Vaugh, another engineer. Simon Day, my right-
9 hand person, when he's not in Ireland. Namid
10 Arshadi, our land man. Bob Ziden, one of the Vice
11 Presidents of Stirling Energy. And Sean
12 Gallagher.

13 HEARING OFFICER RENAUD: Thank you very
14 much.

15 PRESIDING MEMBER BYRON: I don't think
16 we've ever had that many folks here from an
17 applicant.

18 HEARING OFFICER RENAUD: Well, it's a
19 good showing and we're pleased to have them here.

20 Are there people from the Bureau of Land
21 Management here who would care to introduce
22 themselves?

23 MR. BORCHARD: As I looked around the
24 room I realized there's a lot of people here from
25 the Bureau of Land Management. I'm Steve

1 Borchard; I'm the California Desert District
2 Manager.

3 I have several people here on District
4 Staff here today. The Project Manager for this
5 project is sitting to my right, Jim Stobaugh.
6 He's from our national office; he's a BLM National
7 Office Project Manager.

8 I have many people from the El Centro
9 Field Office here who will be working and have
10 been working on this project. Linda Kastoll, Tom
11 Zale, Vicky Wood, Eryn Dreyfus, Carrie Simmons.
12 And from my District Staff in Moreno Valley I have
13 Greg Thompson and Greg Miller and Allen Stein,
14 Steven Razo and David Briery.

15 And if there are other BLM employees I
16 haven't seen out there in the audience, I
17 apologize for not mentioning your name.

18 HEARING OFFICER RENAUD: All right,
19 thank you. And do we have any representatives of
20 intervenors today? CURE?

21 MR. FOLEY: Yes.

22 HEARING OFFICER RENAUD: Please.

23 MR. FOLEY: Hi. My name is Paul Foley;
24 I'm here on behalf of California Unions for
25 Reliable Energy. And we filed a petition to

1 intervene recently.

2 HEARING OFFICER RENAUD: Yes, we did
3 receive that. Thank you for coming.

4 You might have noticed, we've asked
5 everybody who is going to say something to come to
6 a microphone. And there is a reason for that.
7 This proceeding, like all Energy Commission public
8 meetings, is being recorded and will be
9 transcribed into a written transcript.

10 Notice of this meeting was sent to all
11 interested parties, adjoining landowners,
12 government agencies and other individuals on
13 October 30, 2008. And we made sure to follow
14 California law in all respects in terms of
15 noticing these meetings.

16 The reason for that is that the Energy
17 Commission wants its proceedings to be as open and
18 transparent and available to the public as
19 possible. So, we do everything we can to make
20 sure that interested members of the public know
21 about meetings and are able to get to them. We
22 try to hold them in places that are convenient for
23 the people who may be affected by these projects.

24 We also require that the Energy
25 Commission Staff, the applicant and any other

1 party to the proceeding avoid private contact with
2 members of the Committee, that is the
3 Commissioners who are assigned to the case.

4 We want every fact, every piece of
5 information about the proceeding that is going to
6 be used to decide the proceeding to come out and
7 be available to the public in an open forum such
8 as this one. We call that the ex parte rule, and
9 it's set forth in the California Government Code.

10 The purpose of the hearing today is to
11 provide this public forum. This is the first of
12 several hearings and meetings that will take place
13 over the coming months. We're here to provide
14 information about the project, describe the
15 process by which the Energy Commission reviews
16 applications to build power generation facilities,
17 and to identify opportunities for public
18 participation.

19 And to accomplish that we will have a
20 series of presentations. First we will have a
21 presentation by the Public Adviser, Loreen
22 McMahon, who will explain about the ways the
23 public can participate in this case.

24 Then the applicant will provide a
25 presentation, giving information about the

1 proposed project. Then our Energy Commission
2 Staff and Bureau of Land Management will jointly
3 give a presentation about the review process.

4 And we will, as always, have an
5 opportunity, as well, for public comment. When it
6 is time for public comment we'll ask those who
7 wish to speak to come up to one of the microphones
8 up here and provide public comment.

9 We're hoping to be able to set out
10 toward the site visit at about 3:30. So, we'll
11 move right along and start in with the Public
12 Adviser's presentation, if you're ready. Loreen
13 McMahon. Thank you.

14 MS. McMAHON: Thank you, Raoul. I'll
15 add my good afternoon, as well. There's a lot of
16 nuances to this process and Chris will go through
17 the details of it. But another part of it is that
18 the Public Adviser's Office is another
19 independent, separate office. We don't -- so that
20 we can do our job, which is directly to interface
21 with the public and to help you understand the
22 process.

23 So I have some slides, and I apologize
24 to the people who have their backs to it. But
25 primarily we're supposed to help the public

1 understand the process and how they can best be
2 involved. There's different ways and different
3 levels of involvement.

4 I do have a brochure in the back of the
5 room. And I'll be sitting at that table
6 afterwards. I've got my cards out there, as well,
7 and I've got my presentation. So, if you miss
8 anything or you want to talk to me about it, or
9 get the information on it, that's back there.

10 At the Commission there's a lot of ways
11 to get information directly from us. You can get
12 it off the website, or from dockets. We have a
13 listserver and we have a library that's open to
14 the public.

15 In your community there's lots of places
16 to get information. The application for
17 certification for the project has been distributed
18 to the libraries. And also at the libraries you
19 can get access to our website if you don't have
20 internet access at home. That's another way to
21 view it and see what the details of the project
22 are.

23 For this particular project we've had a
24 lot of outreach that we've started quite awhile
25 ago. We sent mailing notices, as was already

1 mentioned, to property owners. We've sent them to
2 the librarians so they can post. Agencies and
3 elected officials. That was when we received the
4 application for certification at the beginning.

5 Then to notice this hearing we expanded
6 our list; we did community outreach and we tried
7 to meet local officials. We put notices out in
8 both -- they were bilingual. They included
9 Spanish. We put notices in newspapers. We did
10 the television and the radio.

11 And if you know of anybody who had not
12 received notification or anybody who would be
13 interested in this project, be sure to invite them
14 in and have them contact my office. We want to
15 make sure that everyone in the community has an
16 opportunity to know about it and to have their
17 voices heard, as the project moves forward.

18 Also in the back we have sign-up sheets.
19 I know some of you have been, you know, signing up
20 when you got in. If any -- we missed you, it's
21 not required that you sign up, but if you sign up
22 you can get mail, U.S. mail notice, or you can
23 sign up for the listserve and get email
24 notification. Or both, if you want both.

25 If you sign the blue cards that

1 information is not transcribed onto a list. So if
2 you want to be on any of our mailing lists, you
3 have to do it on the actual sign-up sheets.

4 I just wanted to also reiterate that
5 everybody's welcome to participate, and that we
6 really encourage it. We really want to hear what
7 the public has to say. Have the local residents
8 know about the issues in their area here.

9 So the two types of participation that
10 we have available for the public is informal and
11 formal. In the informal participation you can
12 make your voice heard by speaking at the workshops
13 and the informational hearings that we will be
14 having throughout the project.

15 You can also write comments that come to
16 you and that you want to have docketed into the
17 proceedings. If you do want to make comments at
18 this proceeding or any other one, this is the
19 little blue card that I mentioned. If you could
20 fill this out then I can give it to the Hearing
21 Officer so he can call you to the podium. That's
22 pretty much what these are used for.

23 I have some at the table that I'm
24 sitting at, at the back of the room, and I left
25 some out front, too. And then when you fill them

1 out give them to me and I'll bring them up to the
2 podium, or up to the Hearing Officer.

3 So, when you make comments, whether
4 they're written or whether they're verbal, they
5 are considered by the Commissioners. They're put
6 into the record. They're docketed in and they're
7 considered. But they are not considered evidence.
8 And that's a big distinction in these types of
9 hearings. And Chris will go over that later.

10 The our other type of participation is
11 the formal participation where you become an
12 intervenor. And you already heard that CURE has
13 filed a petition to become an intervenor.

14 And to do that, if you feel that you
15 want to be at that level of participation, we have
16 forms on the website so that you can file to
17 intervene. And our office will help you with
18 that. So please be sure to contact us so we can
19 help you fill out the forms and help you decide if
20 that's the type of involvement that you want to
21 have.

22 So anyone can file to be an intervenor.
23 And you don't have to be an attorney. And once
24 you file a petition, the Committee will look at
25 the petition and make a decision on whether or not

1 you're approved to intervene.

2 When you do file to become an intervenor
3 you will have the same rights and responsibilities
4 of all the other parties to the proceedings, which
5 would be in this case, CURE, it would be the
6 staff, it would be the applicant.

7 And comments that you file will be
8 considered evidence in the hearing. And you will
9 be able to present your own witnesses for
10 evidence, and cross-examine other people's
11 witnesses, as well. So you become a full party.

12 And lastly there's all the rest of my
13 contact information which is also available in
14 paper form back there. And it's also on the
15 website. So I will be in the back of the room if
16 anybody wants to talk to me about any of this, or
17 get any information from me. Thanks.

18 HEARING OFFICER RENAUD: Okay, thank
19 you, Loreen. And so now we'll move on to a joint
20 presentation by the Energy Commission Staff and
21 Bureau of Land Management.

22 MR. MEYER: While we get that set up on
23 the PowerPoint presentation, in the back of the
24 room there are paper handouts that have places for
25 notes. You can either grab them now or later.

1 Strongly recommend these for people who are going
2 to be involved in the project. It has a lot of
3 contact information and steps that will be very
4 useful throughout this process. So the websites
5 and things that you see here, telephone numbers,
6 are all on this handout for your future reference.

7 HEARING OFFICER RENAUD: Oh, I'm sorry,
8 did I say -- I think I got the order backwards.
9 I'm sorry, let's do the applicant first. I
10 apologize, just happened to be looking in that
11 direction. Applicant, please.

12 MR. EGAN: Thank you very much. Ladies
13 and gentlemen and Commissioners, again, John Egan,
14 Director of Project Development, Stirling Energy.

15 For those in the audience, if you
16 possibly can, see if you can get your eyeballs on
17 one of these two screens. It's a little tough,
18 but the presentation, for the most part, will be
19 on the screens.

20 This presentation today is about the
21 Stirling Energy Systems', we call ourselves SES,
22 the Solar Two project. The agenda for today, I'm
23 going to talk about Stirling Energy Systems; the
24 Solar Two project purpose; the Suncatcher, that's
25 what we call the unit; technology overview; the

1 Solar Two project description; resource areas; the
2 Solar Two project benefits.

3 And you've heard the large number of
4 people we have with us today, so there's a Q&A
5 team, or a question-and-answer team; they'll be
6 assembled on the buses. And they'll be in the
7 back of the room after this. And those in the
8 audience that have technical questions, they can
9 be answered there, as well.

10 Stirling Energy Systems. What we have
11 is a very unique technology; we call it the
12 Suncatcher. It combines a mirrored concentrator
13 dish with a highly efficient Stirling engine,
14 especially designed to convert sunlight into
15 electricity.

16 We've had the technology in development
17 since 1984, but the original engine goes clear
18 back to the early 1800s when a Scottish minister
19 named Stirling, spelled that way, invented this
20 engine during the period of the steam engine,
21 because steam engines were blowing up and killing
22 people. He designed this to be a safer method of
23 converting heat to mechanical energy.

24 We hold one of the world's records of
25 efficiency for conversion of sun's energy into

1 grid quality electricity at 31.25 percent. We're
2 a United States company. We're headquartered in
3 Phoenix, Arizona. We do have offices in Tustin,
4 California and Albuquerque at Sandia National Labs
5 is doing all our research.

6 So what's the project purpose? Our
7 purpose is to provide 750 megawatts of renewable
8 electrical capacity under a 20-year power purchase
9 agreement with San Diego Gas and Electric. To
10 develop renewable solar energy to help California
11 achieve its renewable portfolio standard, also
12 known as the RPS, requirement. This was raised
13 just recently, and most of us and the audience
14 know this, to 33 percent by Governor
15 Schwarzenegger, which was signed on November 17th.
16 So it's 33 percent by 2020.

17 We'd like to help protect the
18 environment by delivering clean, renewable solar
19 energy. And to assist the State of California in
20 meeting its goals reducing greenhouse gas
21 emissions to 1990 levels by 2020, also known as
22 Assembly Bill 32.

23 So an overview of the technology. It
24 actually in many ways is quite simple. The
25 sunlight shines on a large mirrored dish. The

1 mirrors are very simple, very similar to the
2 windows in your car. It's a silvery dish.

3 The light then shines into the back of
4 the engine which you can see on one of these
5 slides. The back of the engine, sunlight is
6 concentrated to approximately 7-inch beam. Then
7 it heats the back of the engine, driving a
8 mechanical process. It generates 25,000 watts of
9 electricity per unit. The electricity then is put
10 out on the grid for us all to use.

11 The unit has some unique environmental
12 properties. One, if you notice the bottom of the
13 unit -- I'll use this one over here to point --
14 there's only a 2-foot circle where this touches
15 the ground. The rest of the ground is untouched
16 by our units, therefore it doesn't have to be
17 plowed ground in order to put these up.

18 It consists of some fairly simple things
19 to make, such as a box truss which supports the
20 mirrors; a couple of azimuth drives that move the
21 unit around. And then a controller that always
22 knows where the sun is. Each one of these is like
23 an independent robot, be it one or a million of
24 them, they all work basically the same way.

25 In the morning the sun comes up; the

1 unit knows where the sun is. It goes and finds
2 the sun and plugs the light beam into the back of
3 the engine. Six seconds later the engine starts;
4 it starts putting power onto the grid.

5 The interesting thing about these units
6 is it's one of the few technologies right now
7 available that can be constructed in U.S. steel
8 plants, or U.S. auto plants. The possibility of
9 helping put Americans back to work and get us off
10 foreign oil.

11 The unit is designed to produce and
12 provide peak generation in peak demand periods.
13 So the engine is really about the size of an oil
14 drum. And this is a picture right here on this
15 one over here, on the left.

16 It has no combustion products, no air
17 emissions, no hazardous heat transfer fluids, no
18 fossil fuel infrastructure is needed to operate
19 it. It's cost competitive; it fits the model T
20 mass production model, can be made by the
21 thousands. Zero pollution. Provides peak power
22 when we all need it the most. And that's when we
23 get up in the morning, when the sun is up, and we
24 come home at night and turn on the air
25 conditioner.

1 The Solar Two project site is located
2 west of here in an area next to what's known as
3 Plaster City. And it is going to be constructed
4 in two phases. Phase one, 450 megawatts -- I'm
5 sorry, 300 megawatts, and phase two will be 450
6 megawatts. Phase one is shown in green on this
7 slide. Phase two is in the yellow.

8 It is connected to the grid via a gen
9 tieline which comes from the main center down an
10 existing power line to the IV substation where it
11 will be connected into the grid.

12 This will be one of the world's largest
13 solar power plants. And it probably will be when
14 it comes online, the world's largest, at least for
15 awhile. 750 megawatts of solar power right here
16 in the Imperial Valley.

17 It's located on approximately 6140 acres
18 of federal land administrated by the BLM. And 360
19 acres are private land. Total about ten square
20 miles of land.

21 The project was sited to avoid or to
22 minimize impacts to the environment, such as ORV,
23 offroad areas, and environmentally sensitive
24 areas.

25 Solar Two would consist totally, if the

1 whole thing was built out, as many as 30,000 of
2 these units with associated equipment and support
3 systems. Probably more interesting things is here
4 in the desert is our water need. At the startup
5 level of 300 megawatts we only need 14.5 acrefeet
6 of water to operate this system. And we need 32.7
7 acrefeet once we go into the full 750 megawatts.

8 To give you a feel for that, an average
9 house in San Diego with four people in it consumes
10 an acrefoot. So it's very minimal water use. And
11 it's mainly to wash our mirrors.

12 Again, two phases. Phase one, 12,000
13 Suncatchers, 300 megawatts. Phase two will expand
14 out to 18,000 additional Suncatchers for a total
15 of 450 megawatts. Total up 750 megawatts.

16 Subject to receipt of all necessary
17 approvals construction should start in about 2010
18 with a projected commercial operation start date
19 of later that same year.

20 It will require the construction of a
21 new 230 kilovolt substation which will be located
22 in the center of our project. Interconnected, as
23 I said earlier, with the SDG&E Imperial Valley
24 Substation along the existing power corridor.

25 The Sunrise Power Link is required for

1 us to move the second phase power of our unit, 450
2 megawatts, and for future clean, renewable power
3 projects in the Imperial Valley to move their
4 power into the grid.

5 It's hard to hide ten square miles of
6 solar dishes. It will be visible. It'll probably
7 be a tourist attraction. This is a picture of
8 generally what it would look like as you're going
9 down the freeway, the bottom picture on the slide.

10 Proposed project schedule, we've already
11 submitted the application for certification, and
12 that's how we got to this point. By 2009, fourth
13 quarter, we hope to receive certification of the
14 plant.

15 By 2010, first quarter, we'd like to
16 begin construction. In the third quarter, phase
17 one units should go online. 2012, second quarter,
18 phase two first units online. And by 2014
19 complete construction of 750-megawatt plant.

20 Resource areas. We're going to do this
21 to adhere to all local, state and federal laws,
22 ordinances, regulations and standards, known as
23 LORS. Cultural resources, we have done extensive
24 archeological and historical architecture,
25 pedestrian surveys to try to identify and

1 potentially mitigate adverse cultural effects of
2 the project.

3 Visual resources surveys were also
4 conducted, including the preparation of visual
5 simulations like you just saw. The visual
6 character of the area will change.

7 Land use. The project site, again, was
8 chosen carefully to avoid impacts to recreational
9 land uses including ORVs. BLM would require the
10 approval of a land use amendment issuance of a
11 right-of-way grant for us to go forward.

12 Solar Two project benefits. Would help
13 California achieve its RPS standard, and also help
14 California reduce its greenhouse gas emissions to
15 1990 levels by 2020.

16 Jobs. We would create approximately 106
17 permanent jobs in the Imperial Valley. This would
18 be supervisory, general, administrative,
19 construction, operations and maintenance.
20 Typically sociologists put a 30 multiplier on new
21 jobs, therefore we're creating close to 500
22 permanent new opportunities here in the valley.

23 Construction of Solar Two would lead to
24 increased revenue in the area from sales tax due
25 to construction and operation employees' economic

1 activities. Solar Two would provide approximately
2 60 million in 2008 dollars in construction payroll
3 with an average monthly construction workforce of
4 approximately 360 people. Total project value, \$1
5 billion approximately.

6 Educational benefits have already
7 started. We've been working with some of the
8 local schools and tech colleges. We're just
9 getting started on this. We'd like to, as much as
10 possible hire local. We expect a potential boost
11 in tourism, as well.

12 I'd like to thank you for your time.
13 And if you notice on the slide, there's both our
14 address and the California Energy Commission. I
15 also have cards if anybody's interested. Thank
16 you very much.

17 HEARING OFFICER RENAUD: Thank you very
18 much. And now we'll turn to a presentation by the
19 staff and the Bureau of Land Management. Sorry if
20 I scared you there earlier, Chris. Now, it's your
21 turn.

22 MR. MEYER: Just sort of threw me for a
23 loop there, I was trying to catch up.

24 Okay, once again, Christopher Meyer. I
25 will be working on the Energy Commission portion

1 of this joint process. And to my right is Jim
2 Stobaugh.

3 MR. STOBAUGH: Hi, I'm Jim Stobaugh, the
4 Project Manager assigned for the Bureau of Land
5 Management.

6 MR. MEYER: And just a second here,
7 we're -- hold on just a second.

8 (Pause.)

9 PRESIDING MEMBER BYRON: While there's a
10 break in the action can I just ask our audience if
11 you wouldn't mind just raising your hand if you're
12 here because you're a local resident or someone
13 who lives here in southern California that's
14 interested in this project and that's why you're
15 here.

16 Thank you very much. It's just that we
17 have so many applicants and so many members of the
18 staff and others here, it was just good to see
19 that there were members of the public here today.

20 (Laughter.)

21 MR. STOBAUGH: Commissioner Byron, I'd
22 really like to thank the Commission for this
23 opportunity, as well, on behalf of the BLM, as
24 well as a wonderful turnout for this, because
25 we're here for the folks here to provide them the

1 opportunity to input, so it's great to see the
2 turnout we have.

3 MR. MEYER: Okay, as I said before,
4 it'll be a joint process. And this presentation
5 will also be on our website for those of you who
6 go later, you can always see this as a pdf. It'll
7 have all the same information, if you have any
8 questions on the process, contact information.

9 And as I said, it's going to be a joint
10 process. Jim and I will be working very closely
11 together to make sure that both NEPA and CEQA
12 aspects of this project are addressed.

13 MR. STOBAUGH: Yes, and as you can see
14 from the slide, the Bureau of Land Management is
15 tasked or charged with administering this
16 application through our Federal Land Policy and
17 Management Act. That's our FLPMA's, sometimes as
18 we refer to it as. That is what the right-of-way
19 is actually filed under, what the Stirling Energy
20 Systems is looking for a decision from BLM.

21 And we also, as the second bullet talks
22 about, is review our land use planning and
23 processing and land use plan amendment. Because
24 under the current application and our current land
25 use plan, which I'm going to hold up quickly here,

1 it's the California Desert Conservation Area Plan
2 passed in 1980. Sites associated with power
3 generation and transmission sites identified in
4 the plan, such as this one, will be considered
5 through plan amendment process.

6 And if I could, just to help frame BLM's
7 purpose and need in here, so folks understand
8 what's involved with our process and why we're
9 here asking for your input, really the purpose of
10 BLM's action, and I want to stress that, BLM's
11 action, is to provide the applicant a response
12 decision in processing their application for a
13 right-of-way grant for the legal use and access of
14 the public lands managed by BLM.

15 And the need for that action, in view of
16 the underlying opportunity here, is established by
17 FLPMA, our responsibilities under FLPMA, as well
18 as the National Environmental Policy Act and other
19 laws to respond to the applicant's request for
20 these right-of-way of the legal use opportunities
21 on this, on the public lands.

22 And that's not only just from the
23 construction and operation, even through the
24 decommissioning of the proposed concentrated solar
25 thermal generation plan related facilities.

1 So, the decision we're looking at down
2 the road here is BLM to decide whether or not to
3 grant a right-of-way. And if so, under what terms
4 and conditions will that be.

5 So, that's kind of helping your frame,
6 if you would, and kind of the gist behind what
7 most of the bullets are on this particular slide.

8 MR. MEYER: Okay. And the Energy
9 Commission's role, as you've heard from several
10 people already, is we're looking at the CEQA side
11 versus the NEPA side. And our role is to look at
12 thermal power plants that are greater than 50
13 megawatts.

14 What you may hear this back and forth,
15 when we talk about thermal, this is referring to
16 any power plants that derive their electricity
17 from a process that is involving heat. Something
18 like a photovoltaic site, wind, those do not have
19 a heat component, and are therefore outside the
20 jurisdiction of the Energy Commission.

21 Anything like solar troughs or this
22 project, which is the Stirling engines using heat,
23 fall into the jurisdiction of the Energy
24 Commission.

25 We also look at other facilities such as

1 the transmission lines that are associated with
2 this project. We look to the first point of
3 interconnection which basically is from the
4 project site to the substation in this case.

5 And we also look at if there are
6 portions of transmission lines after that point
7 that will need to get upgraded, you know, heavier
8 wires, larger poles, anything of that nature,
9 because of this project, we'll look at those in
10 more of a cursory manner. And they also have to
11 be dealt with at a later point.

12 We also deal with water supply systems,
13 you know, for this project; you know, access roads
14 that may be necessary; laydown areas that are not
15 directly part of the process, but will be areas
16 that will be disturbed because of the construction
17 or operation.

18 And as I said, you know, we are the lead
19 agency for the CEQA portion, which is the
20 California Environmental Quality Act.

21 And one of the things that both Jim and
22 I worked very closely on is to make sure that any
23 local agencies, federal agencies, state agencies
24 that have jurisdiction on this process, who are
25 going to be, you know, providing this information

1 either on cultural, biological issues, to make
2 sure that we work with them.

3 Also work with any local agencies,
4 elected officials, to make sure that their
5 concerns, comments are addressed in our
6 environmental document.

7 So basically there are three parts of
8 the Energy Commission's process which the BLM and
9 the Energy Commission will be working to align
10 these as much as possible.

11 The first stage has already occurred,
12 which is data adequacy. When we refer to
13 something as data adequate we do not mean that it
14 has every bit of information that we need to go
15 forward. We're just saying that data adequacy is
16 the minimum to accept that application as
17 adequate. It has the minimum that we need to
18 start the whole process.

19 Then what brings us to the second phase,
20 which is the discovery and analysis. One of the
21 first steps on that is data requests where we say,
22 okay, you've given us the minimum amount of
23 information for your application to be considered
24 complete. Now we need additional information to
25 do a full and comprehensive environmental

1 analysis.

2 So that's where we start asking the
3 applicant questions. We've sent out the first
4 part of our data request to the applicant already.
5 And they'll be, by about December 9th they'll be
6 getting us information back on that.

7 Another thing we'll talk about a little
8 bit more later is the issues identification
9 report. That's basically a very early document in
10 the process where we say what major issues, what
11 potentially are either show-stoppers or
12 significant environmental areas could be impacted
13 from the proposed project. And that's online, as
14 well. So you can see the entire report. I'll
15 talk about it a little bit more later.

16 The public workshops, as Raoul talked
17 about, there will be a couple different types of
18 public meetings, forums, for people to give
19 comments. One will be the hearings like this,
20 which will be a very formal setting. It'll have a
21 court reporter; there'll be an official record.

22 Later on you'll have workshops that will
23 basically be between the BLM Staff, Energy
24 Commission Staff, the applicant, any intervenors,
25 other parties. And because of the ex parte rule

1 and sort of the open meeting rules, we have to
2 have any substantive discussions on topics in the
3 public view. So that any decisions that we make,
4 issues that we need to get clarified, we have to
5 make those in the full view of the public so you
6 know what issues are going back and forth on the
7 project.

8 So basically these workshops are almost
9 like it's an open meeting. It'll be a meeting
10 between the parties to get work done. But it
11 offers the public a chance to ask questions, get
12 clarification.

13 So we use this as a chance for -- the
14 Energy Commission to work with the BLM to open
15 this as part of a scoping process.

16 And the next workshop, you know, we'll
17 talk about, it'll be fully noticed, will be on
18 December 18th. That will give our staff a little
19 time to get the data responses in. It'll be a
20 data response, issues resolution, workshop and
21 scoping. And that'll be the final sort of scoping
22 workshop of the process. And then the scoping
23 period for the BLM within 50 days after that. So
24 you have a little bit more time to get scoping
25 comments in there.

1 Then the preliminary and final staff
2 assessments. That's, for those of you who are
3 familiar with, like the environmental impact
4 reports, environmental impact statements, sort of
5 a NEPA/CEQA process. Our preliminary and final
6 staff assessments are equivalent to an
7 environmental impact report.

8 And basically then we come to the third
9 portion, after our staff works together with the
10 BLM, to get these preliminary and final documents
11 out, on my side I turn that over to the Committee.

12 And then the Committee will go ahead and
13 the Hearing Officer, Raoul, will be holding
14 evidentiary hearings, and the Committee will put
15 together a decision.

16 This gives you a little bit of an idea,
17 sort of that same process of how it goes through.
18 It's just sort of a good place just to sort of see
19 how things flow together between the hearings and
20 the proposed decision and the final decision.

21 And these different processes, different
22 hearings and the spaces between the different
23 preliminary documents and the next one, there'll
24 be a lot of public involvement for people to
25 provide us comments.

1 And we always ask people to provide
2 written comments wherever possible. Anything you
3 give me in writing, it makes it very easy for me
4 to pass it on to staff, make sure everyone
5 understands exactly what you're asking for, what
6 questions, concerns you have. So that I don't
7 have to try to interpret what your concerns are as
8 I pass them on.

9 And I've pretty much gone through most
10 of this, as I talked about before. This goes into
11 a little bit more detail you can reference later.
12 But when we look at our discovery and analysis
13 process, the job of staff is to work as almost a
14 disinterested third party. We're neither an
15 opponent or proponent of the project.

16 Our job is to make sure that the public
17 questions are addressed, and that the public good
18 is looked after. And just to facilitate that
19 process.

20 And that brings us, you know, to after
21 the staff has finished our part, our main job is
22 to give the Committee as much information as
23 possible, to give a very complete record so that
24 they can make the best decision possible. As has
25 been said several times before, any information

1 you're able to provide us helps us get a better
2 product.

3 So, you know, the more public
4 participation we can get, more comments we can get
5 early in the process, that makes sure that we can
6 address them in our preliminary and our final
7 documents, and give the Committee a complete
8 record.

9 And one last thing just on the last one,
10 just very briefly, the Energy Commission, at the
11 very end of our process, one of our important
12 roles is any decision that comes out of the Energy
13 Commission to allow to go forward during
14 construction, the Energy Commission has the
15 responsibility to make sure that any conditions,
16 all conditions, are enforced throughout the
17 construction and operation.

18 So we'll be working with the BLM and
19 their code enforcement staff to make sure that if
20 we go to a point where this project is recommended
21 and it does actually get approved, in that case
22 any conditions that are put in there to mitigate
23 environmental or potential environmental impacts,
24 we have a special crew that is focused on making
25 sure that that happens.

1 And as I introduced before, Mary Dyas is
2 with our compliance unit and she'll be taking
3 charge of that.

4 Thank you.

5 MR. STOBAUGH: Thanks, Christopher. One
6 of the things, to just kind of let the audience
7 realize, as you've been hearing Christopher, we're
8 walking down this aisle together, if you would.

9 We both have responsibilities, one at
10 the state, and, of course, at the federal level.
11 There has been a memorandum of understanding
12 developed between BLM and the Energy Commission.
13 And the intent behind that is to conduct a joint
14 environmental review of the Solar Two project into
15 a single NEPA, as I referred to earlier, under
16 BLM's guidelines, and CEQA, the state process, to
17 share in the preparation of a joint environmental
18 analysis. And to avoid duplication, if you would,
19 of our staffs; share that expertise among our
20 staffs.

21 As well as promote the intergovernmental
22 coordination, both the local, state and federal
23 levels. And facilitate public review. You know,
24 instead of having you guys here one set of
25 meetings, yet another set of meetings, and you

1 realize we're all walking down the analyzing the
2 same project. Let's bring them together like this
3 so you can understand we are walking down two
4 process and trying to combine the efforts, as well
5 as the efficiencies, that we can, you know, build
6 in with them.

7 And the other points I just bring up
8 here is the policies. We want -- the second
9 bullet there is we want to facilitate
10 environmentally responsibility commercial
11 development of solar energy projects on the public
12 lands.

13 That's the gist of what that W,
14 Washington Office instruction memorandum of 2007-
15 97 gets into. And there's copies, as you can see
16 at the bottom there. You can go to it and pull up
17 that particular document. But that's what the
18 policy is after.

19 We want to also look at the right-of-way
20 applications for solar energy projects. They're
21 all considered a high priority that will be
22 processed in a timely manner. And if approved, as
23 I mentioned earlier, it would be approved under
24 Title 5 of the Federal Land Policy and Management
25 Act.

1 So, as we, again we're walking down,
2 trying to do this in a joint, collaborative effort
3 to facilitate and invite, at the same time, the
4 public's input and your perspective of what you
5 see as far as the related issues, if you would, or
6 concerns you may have in this.

7 And I want to reiterate something
8 Christopher brought up. Of course, you may speak
9 on things. But if we could -- we certainly want
10 to encourage written comments. That way we know
11 exactly what you are trying to state in there, and
12 we will look at those verbatim. So we have in
13 your own words the comments you really want to
14 place in any type of input regarding this project.

15 So strongly encourage you, if you will,
16 to not only do it verbally, but at minimum do it
17 in writing. And hopefully we'll have it right.
18 We'll be able to track it. We'll even be able to
19 see where we addressed it in our NEPA and CEQA
20 documents in the processes, to make sure that the
21 comment was addressed.

22 This is a slide that shows basically the
23 regulations that the Bureau of Land Management is
24 going to be working under, 43 Code of Federal
25 Regulations 2800, to walk through our processes.

1 These two sites on here are on the
2 internet on the website. The first one is just
3 general right-of-way guidance. And the one down
4 at the bottom on solar right-of-way is
5 specifically getting at the policies and that
6 instruction memorandum that was referred to on the
7 previous slide.

8 So as we go through the BLM authorized
9 role in this is going to look at the initial
10 response to the proposal; go through this
11 preapplication screening to see much like
12 Christopher and them were talking about, what do
13 we have in an application to consider it complete
14 enough to move on to acceptance in processing. Or
15 is it something we know through land use planning
16 would not be warranted or allowed.

17 This one actually is going to require a
18 land use plan amendment, and is allowable under
19 the rules of land use plans, if you would, to
20 consider an amendment for this type of proposal.
21 It's about it being, you know, excluding or
22 disallowing all together.

23 We conduct the scoping. You can see
24 where we're at in this slide right here today.
25 And after this we collect your input. We begin

1 developing our environmental impact statement
2 document. And at the same time, it's a land use
3 plan amendment.

4 So, as I mentioned, the two purposes and
5 needs earlier, that's the reason why the BLM is
6 looking at a twofold decision in this case. So we
7 have a decision on the application, as well as the
8 approval of the land use plan amendment, to
9 authorize the use, as Christopher referred to as
10 what the Commission is up to, we have to look at
11 administering this all the way through its
12 termination. So cradle to grave.

13 Here, if you want, real quick -- I'm not
14 going to go into all of the points, but as you can
15 see, here is the process both for under the
16 National Environmental Policy Act, NEPA, for an
17 environmental impact statement, as well as the
18 land use plan amendment.

19 The notice of intent was released on
20 October 17th in the Federal Register. We're at
21 this public scoping period right now. From this
22 we will help us, from the information and data
23 requests and working with the CEC on this, help
24 us, as well as our own data and our own staff
25 under Steve Borchard's and Vicky Wood's

1 organization here, who really have the on-the-
2 ground expertise of looking at things more
3 realistically and practically, will formulate our
4 alternatives to be considered, as well.

5 And then again, eventually, you can see
6 there's going to be the preparation of a draft
7 environmental impact statement, as well as the
8 draft land use plan amendment.

9 That'll have a 90-day comment period.
10 So there is, after the scoping ends for the front
11 end to develop that draft EIS, will be a 90-day
12 comment period afforded you in the future.

13 There'll also be another comment period
14 for 30 days after the final, as you can see, as we
15 work our way toward the record of decision and
16 approval of the land use plan amendment.

17 And as Christopher brought up, as well,
18 you can see the last little bullet is monitoring
19 the project is all a part of the process, as well.

20 Thanks a lot.

21 MR. MEYER: Okay, I won't go through
22 this because you've actually heard the
23 introductions of everyone here, but this is a
24 slide that's good for you to reference throughout
25 the process if you want to contact any of the

1 parties from the Energy Commission side.

2 MR. STOBAUGH: And here's the contact
3 information for the Bureau of Land Management. As
4 you can see, the receipt of scoping comments are
5 actually going to Christopher Meyer and the
6 Commission, itself. Again, trying to streamline
7 and make convenience where these comments are
8 going in our joint effort to analyze this
9 proposal.

10 MR. MEYER: And Loreen actually did a
11 great job just going through the public
12 participation process. And this just gives you a
13 little bit more information on the listserver. If
14 you go to the Energy Commission website you'll see
15 right on the website there is a little box there
16 you can enter your email address in. And that way
17 anything that gets put on the website you'll get
18 an automatic email. It's a great way of just
19 keeping up to date if there are any changes on the
20 project website, any new documents that are added.

21 And as I talked about before,, our
22 dockets unit, you know, will keep a complete
23 record. Even documents that are just letters
24 going back and forth, memos, records of
25 conversations that may not go onto our website.

1 There'll be a complete docket log of those.

2 And that docket log will be on the
3 website. You can see, even if it's not printed as
4 a full document, it'll be on the website as a
5 list. And if there's anything you see in there
6 that you'd like to see a copy of, you can contact
7 the dockets unit to get a copy.

8 And basically this is just stuff we've
9 gone over before, as far as the different ways you
10 can make oral comments in a forum such as this,
11 and there'll be a record. At the different
12 workshops, which will be run by Jim and I. Your
13 opportunities to come up and make, you know, oral
14 comments, as well.

15 But there will not be a reporter at
16 those workshops, the staff workshops. So any
17 comments you make there it's just really dependent
18 on how well our staff can write down your comments
19 and take notes on it.

20 So it's great for you to come out and
21 express your issues to everyone verbally. But if
22 it's really an issue that you want us to deal with
23 in sort of very strict detail, following it up
24 with a written comment and just send it to my
25 attention, would be wonderful. And then I can

1 make sure that Jim and all the other parties get a
2 copy of your comments and your questions.

3 And a formal intervenor is -- you know,
4 she's gone over fairly well, and it's a good idea,
5 when you're thinking of potentially becoming a
6 formal intervenor, talk to Loreen as far as what
7 both of the advantages and also responsibilities.
8 Because by being a formal intervenor, it changes
9 some of the responsibilities you have as a party
10 in the case. And it's good to understand this
11 before you decide, you know, make that decision.

12 And this is just what the webpage looks
13 like. You can see where the listserver is, the
14 little box there. So this will be consistently
15 updated throughout the project. And you'll see
16 different tabs. You can go to different places
17 throughout.

18 Actually when you go here you can also
19 go backwards onto the Energy Commission's website
20 and see other cases. Also you'll see the
21 different memorandums of understanding that Jim
22 spoke of. Those things are all in pdf so you can
23 look and see what the details of those are, as
24 well.

25 MR. STOBAUGH: And this is the Bureau of

1 Land Management's site for over here and El
2 Centro, as well. So you can -- you know you're in
3 the right place if your slide looks like this when
4 you bring it up.

5 MR. MEYER: Just to make a note, I think
6 both of our websites have links to our
7 counterparts. So, if you find one of them, you
8 should be able to, you know, look around and
9 you'll find a link to the corresponding agency's
10 website on the same project.

11 Okay, this bring us to the staff issues
12 identification report, which I talked about
13 before. Sort of our initial impressions of the
14 project in looking through the application for is
15 it complete, and also starting to formulate our
16 data requests.

17 Staff, at that point, looks at the
18 things that they say, okay, I have lots of
19 questions on a certain area. And if it looks like
20 it could be a significant issue, either delaying
21 the project or possibly affecting staff's ability
22 to make a recommendation, we try to focus on those
23 things early on so that the public understands
24 what issues staff is focusing on, so you can make
25 comments specific to those areas.

1 On this project really there are three
2 areas, and then the cumulative impacts. So,
3 cultural resources is one of the big areas. Land
4 use, as you can imagine, for a project of this
5 size. Visual resources, again from the scope.

6 When we talk of cumulative effects and
7 alternatives, cumulative effects is for almost any
8 area that you can have an environmental impact.
9 We want to look at are there four or five other
10 projects in this area, that this project may not
11 have a significant impact, but when you add it to
12 all of the other ones that may not have a
13 significant impact, either, but cumulatively there
14 is a significant impact. That's one of the things
15 that the Energy Commission and the BLM will be
16 looking at throughout this process.

17 And then alternatives. If a significant
18 impact is identified in any one of the technical
19 -- either engineering or environmental areas, we
20 will be looking at alternatives that focus on
21 reducing that to a less-than-significant impact.

22 Cultural resources. Potential issues on
23 this project are based on just both the frequency
24 of the cultural resources, basically meaning for
25 this 10-square-mile portion. There are a lot of

1 archeological resources on this land. And we're
2 still doing a lot of work and the applicant is
3 doing a lot of work, as well, trying to determine
4 the level of importance and significance of these
5 different sites. And what potential impact the
6 proposed project would have on them.

7 So, the Energy Commission Staff and the
8 Bureau of Land Management Staff, the cultural
9 resource experts, have been working very hard on
10 this one. But, as you can imagine, when most
11 power plants traditionally will affect up to maybe
12 100 acres maximum, looking at 6500 acres is a lot
13 of paperwork.

14 So, we're anticipating having data
15 requests on that, you know, probably just after
16 the first of the year -- excuse me, the first of
17 December.

18 The other one we talk about potential
19 discoveries, that's just a very simple way of
20 saying we don't know what's under the ground. We
21 may have a situation where any number of
22 activities could have either obscured or removed a
23 surface expression of an archeological site.

24 When the project starts getting
25 constructed we could discover that there are

1 things there that we didn't know about. So,
2 that's one thing we have to make sure that our
3 documents address and we keep in consideration.

4 And then the mitigation is a part of
5 that. The concern on cultural, you know, how can
6 you mitigate these impacts.

7 Land use, as I said, is simply right now
8 if you have land that is open for potential use by
9 the public for multiple uses, whether it's
10 camping, hiking, offroad use, to transfer that
11 land out of the general public use into a more
12 industrial use for the production of power, staff
13 considers that a potentially significant impact to
14 the public.

15 And that's something that we're going to
16 be looking at very closely. And BLM is going to
17 be really taking the lead on that, working with
18 our staff. And, as I say, this is one where the
19 cumulative impact becomes big. And I'll let Jim
20 talk about that, as far as just the BLM, what
21 they're dealing with right now.

22 MR. STOBAUGH: Well, there are solar
23 power generation -- Steve, you're actually in the
24 frontlines on this, what you're seeing. But, how
25 many applications right now we have?

1 MR. BORCHARD: Seventy-seven.

2 MR. STOBAUGH: Seventy-seven

3 applications. I mean it's just unbelievable what
4 we've looked at.

5 You know, we're looking at the -- you
6 have the 30,000 25 kilovolt solar power dishes
7 that John Egan had covered in there. And these
8 are wonderful maps, by the way, and slides that we
9 have to look at. So if you want a picture's-
10 worth-a-thousand-words.

11 But the related structures you have, I
12 mean you have a main services complex; you've got
13 assembly buildings; you got a 230 kilovolt
14 electrical substation to make this work. The
15 access roads and the water supply lines. And then
16 there's the 10.3-mile, double-circuit 230 kV line
17 that's going to put this -- if approved, going to
18 put this on the grid, itself.

19 So, you have, you know, a wide array, if
20 you would, of impacts to look at. And the links,
21 as well, as with other projects in this vicinity.

22 So, yes, it is going to be a large-scale
23 scope of looking at things, but there are
24 processes in place for both the state and the
25 federal government to deal with them. And we're

1 going to walk through the process. And you are
2 participants being invited, as of today, to walk
3 through that process with us.

4 MR. MEYER: And visual resources, as you
5 can imagine, as John pointed out, that, you know,
6 you can't hide 30,000 of these 40-foot
7 Suncatchers. They do sort of jump out at you.

8 You know, whereas he says, we're going
9 to look at it, you know, there are some people who
10 are going to be really just fascinated to come see
11 them. Staff has to look at this as far as what is
12 the impact of having that many units of that size,
13 you know, in a landscape that right now is just
14 more of an open desert.

15 And the development of the VRM
16 classifications is going to fall into the BLM.
17 It's just to make sure that when our visual staff
18 and BLM visual staff work together that the
19 criteria that we use meet the BLM's needs.

20 I think I pretty much spoke about this,
21 we've covered it pretty well, it's just the
22 cumulative effects is something that we're going
23 to be looking at very closely just because of the
24 sheer number of renewable projects.

25 And not just thermal, but you know,

1 wind, photovoltaic, other projects in the nature
2 that if they're planned for this area they're not
3 going to take up land, have visual impacts, any of
4 the areas. We have to look at those in a
5 cumulative nature.

6 And let me point out, this is a proposed
7 schedule. This is something that staff, both on
8 the BLM and the Energy Commission, we're looking
9 at how fast -- if everything goes really smoothly,
10 how fast can we push this thing through to the
11 point where we can make a recommendation, either
12 for or against this project.

13 And as I say, you know, our job is to be
14 objective on this as neither a proponent or an
15 opponent of the project. So we don't presuppose
16 that we're going to make recommendations to our
17 respective management teams, and in my case, the
18 Commission, to either approve or deny it at this
19 point.

20 But this schedule is something that I
21 have worked with Jim on, and ultimately the
22 Committee that's assigned to this project will
23 look at that. And they will put out an official
24 schedule that they will propose.

25 And, as I say, this project, because

1 it's a joint document between the Energy
2 Commission and the BLM, there will be procedural
3 issues that take a little bit more time than a
4 normal Energy Commission project, plus the sheer
5 volume of information we're dealing with with a
6 site of this size.

7 So our normal 12-month process is just
8 not viable here. And one of the biggest things
9 that I'll say to everyone is this will not be a
10 schedule-driven exercise. We are not going to
11 publish a document before it's ready.

12 We're going to get the information and
13 provide a comprehensive document that'll give the
14 public a chance to participate, but also we want
15 to get the best document possible produced. And
16 if that affects the schedule, unfortunately it
17 does. We'll just work as fast as we can to get a
18 good product together for you, as the public, to
19 review, so that we can get the best comments back
20 from you to get this process, you know, continue
21 it going in a good direction.

22 And I think I've sort of hit all the
23 caveats. I think I made all the possible excuses
24 I can make on why the schedule may get delayed a
25 little bit.

1 It's one of the things that Jim can
2 speak on awhile is that in the NEPA process there
3 are some other protest periods.

4 MR. STOBAUGH: Once we get to a record
5 of decision, should we go with the approval of a
6 land use plan amendment and there after the final,
7 well, actually the issuance of the final
8 environmental impact statement, there will be a
9 30-day availability for review by the public, as
10 well as what's part of that is a protest
11 opportunity.

12 And if there are no protests, you know,
13 the process can move along after 30 days. If
14 there are protests, we're looking more at a 90-day
15 process to deal with rendering resolution with the
16 protests after the final environmental impact
17 statement is published.

18 MR. MEYER: And that concludes my
19 presentation on our process for the siting and I'd
20 like to ask Mary Dyas, the Compliance Project
21 Manager, to speak to you very briefly on our
22 compliance project, if the project were to be
23 approved, the post-certification process.

24 MS. DYAS: Good afternoon, everyone. My
25 name is Mary Dyas; I'm the Compliance Project

1 Manager assigned to this project for the Energy
2 Commission.

3 And I first off want to make sure,
4 assure you that my being here and giving this
5 presentation by no means is meant to imply or
6 assure that the project has been approved.
7 Approval or disapproval will come after the
8 comprehensive siting process, which Chris and the
9 BLM Staff have just gone over for you.

10 I'm here to assure you that if the
11 project is licensed, there is a rigorous ongoing
12 monitoring process by the compliance unit for the
13 proposed project to insure that it is built,
14 constructed and operated in accordance with all
15 applicable laws, ordinances, regulations and
16 standards, to include the conditions of
17 certification that are put forth in the final
18 documents that's going to be produced.

19 In addition, also before I move on to
20 that next step, during the siting process now is
21 the appropriate time for the public, as well as
22 agencies and all other parties to the project, to
23 comment on the document and the conditions of
24 certification, because it becomes much more
25 difficult to change the conditions once the

1 license is issued.

2 In addition to myself and Commission
3 management, there is a third-party delegate
4 involved in the compliance process to oversee the
5 construction of the project. This delegate is a
6 chief building official, which is delegated by the
7 Energy Commission.

8 The CBO, or chief building official, can
9 be a local building official such as the city or
10 building department, but in most cases it is a
11 third-party company from the preapproved statewide
12 list of qualified delegate CBOs that is maintained
13 by the compliance unit at the Commission.

14 And though the CBO reports directly to
15 the Commission compliance unit, their expenses and
16 activities are paid for by the applicant.

17 In most cases, shortly after this final
18 staff assessment or final EIS, I don't know what
19 they're calling it for sure, shortly after that
20 document the final document is published, the
21 Compliance Project Manager, in this case myself,
22 and legal staff will delegate authority to enforce
23 onsite compliance to the CBO through a memorandum
24 of understanding.

25 The delegate CBO is responsible for

1 monitoring all critical construction activities to
2 insure compliance with facility design,
3 transmission system engineering. And to insure
4 that related civil, structural, electrical and
5 mechanical codes are consistent with county, state
6 and federal building requirements.

7 Also, once a project is licensed, a
8 compliance fee is imposed on the project. And
9 those fees are due after licensing and then every
10 year after that for the life of the project, by
11 July 1st.

12 And occasionally, as I mentioned, it's
13 more difficult to change the conditions of
14 certification after the license, but occasionally
15 a project owner may decide that they do want to
16 make changes. And some of those changes may be
17 due to new technology or unforeseen constraints
18 that have come up.

19 If this occurs, the applicant will be
20 required to contact the Commission compliance unit
21 and arrange a pre-amendment petition meeting to
22 discuss the proposed changes. And then, if and
23 when the owner proceeds with an amendment
24 petition, a notice of receipt will be sent out to
25 the combined mailing lists that will include all

1 the names that are on the mailing list in the
2 siting process, as well as any additional ones
3 that have been added during the compliance
4 process. And this also includes the surrounding
5 landowners and residents within 1000 feet of the
6 project.

7 Staff will then process the amendment,
8 and where needed will provide technical analysis
9 similar to the analysis that's being done on this
10 application for certification during the siting
11 phase.

12 And that is pretty much about what the
13 compliance process is. And this goes on for the
14 life -- we monitoring the operation of the project
15 for the life of the project, not matter how long
16 that could be, 20, 30 years or longer, if
17 necessary.

18 I have cards if anyone is interested.
19 And then there's also on the website, I don't
20 believe they put it on till later in the process,
21 but they do create a compliance project page
22 associated with a particular project. And then my
23 name and information will be on there if you need
24 to contact me.

25 Thanks.

1 HEARING OFFICER RENAUD: Okay, thank
2 you, everyone, for those excellent presentations.
3 Very informative.

4 The Committee will review the proposed
5 schedule and the comments submitted by the
6 applicant with respect to the schedule, and issue
7 a scheduling order which will constitute the
8 expected schedule for the case. Sometimes, as Mr.
9 Meyer pointed out, unavoidable, things occur that
10 you can't -- that will affect the schedule. But
11 for the most part we'll try to stick to the
12 schedule that will be set forth by the Committee
13 in the next few days.

14 At this point I think we will move into
15 our public comment period. I have a card first
16 indicating that Imperial County Supervisor Gary
17 Wyatt is here. Mr. Wyatt, did you wish to speak?

18 SUPERVISOR WYATT: Yes.

19 HEARING OFFICER RENAUD: All right,
20 please come forward. I'm sure you're used to
21 speaking in this room, so.

22 SUPERVISOR WYATT: Maybe, a couple
23 times. Maybe this morning, as a matter of fact.

24 (Laughter.)

25 SUPERVISOR WYATT: Good afternoon and

1 thank you for being here today, and for everyone
2 else that has attended this very critically
3 important meeting. Not only for this project, but
4 we believe for our county, as a whole.

5 Let me start, I have asked, about a half
6 hour ago, if they could find out why it's about
7 150 degrees in here. You know, when summer has
8 already ended, and so hopefully we can get it
9 cooler than it is now in the room.

10 I'll keep my comments very brief. It's
11 just plain and simple. We sent a letter in; we'll
12 be commenting further, I believe, as a county.
13 But I'm here to re-register those particular
14 feelings and my own personal feelings on this
15 particular project.

16 This particular project, we believe, is
17 the beginning of a great deal of opportunities our
18 county has been looking for for many many years.
19 We are the answer to many of the needs of people
20 throughout the southwest and throughout
21 California.

22 We are the home of renewable energy. We
23 believe that we are the county that could
24 literally become the capital of renewable energy
25 in the United States. Between geothermal, solar,

1 and wind power we believe that we could produce
2 thousands and thousands of megawatts.

3 What we do need, of course, with this is
4 we cannot magically move this power from here to
5 those centers that need that power through some
6 other type of technology, other than transmission
7 lines. And we need transmission lines. This
8 project specifically needs that.

9 But we believe this is a great
10 renewable, clean project that will do tremendous
11 things, not only for our county, but for others,
12 as well.

13 Being a rural county, a small county,
14 that sits next to a million people to our south
15 and millions and millions of people to the west
16 and to the north, we've given a great deal of our
17 resources sometimes not so willingly, in the form
18 of water and other types of things. And now when
19 we are trying to give the power, we hope that you
20 will work with us to make that happen.

21 We want to do it in a responsible
22 manner, of course. And all the compliance issues
23 must, of course, be followed. But this is about
24 meeting the needs not only for the RPS for areas
25 outside of ours, but also to meet the needs for

1 this area.

2 We're historically one of the highest
3 unemployment areas in the United States; in excess
4 of 20 percent. When I saw the other day they were
5 complaining in areas that their unemployment had
6 gone up to 6 percent and 8 percent, we would be so
7 ecstatic if our unemployment rates were just down
8 around 10 percent. But historically they've been
9 anywhere from 17 to 25 percent per year.

10 It's unbelievable that that could occur
11 year after year, and we've been working very hard
12 to help that to be different than that.

13 This project will be the beginning of
14 that type of thing. This is the future for our
15 Valley. It brings a new industry other than just
16 farming. We'll always have farming, but we
17 believe that renewable energy is something that's
18 very viable for our Valley. And we can provide
19 the answers and the solutions for many of the
20 other parts of the southwest United States and all
21 of California.

22 We encourage you to help us get this
23 through and get it passed, and get it built.
24 That's what we would like to see done. Imperial
25 County stands strongly behind Stirling Energy's

1 project.

2 PRESIDING MEMBER BYRON: Mr. Wyatt,
3 thank you for being here.

4 HEARING OFFICER RENAUD: Thank you.
5 John Menvielle, did you wish to speak?

6 MR. MENVIELLE: Yes, thank you. Good
7 afternoon. I'm John Pierre Menvielle, President
8 of the Imperial Irrigation District Board of
9 Directors.

10 I am here to speak in favor of the
11 Stirling Energy Systems solar project in the
12 Imperial Valley.

13 IID is the third largest public power
14 provider in the State of California, and is a
15 staunch supporter of the development of renewable
16 energy resources within its service area.

17 We view projects like this one as being
18 essential to spurring the growth and development
19 of this emerging segment of the regional economy.
20 The District has committed its own resources to
21 upgrading its transmission systems to promote the
22 growth and development in the coming years.

23 As an energy balancing authority we
24 applaud Stirling's innovative technology. As an
25 irrigation district, we are greatly encouraged by

1 the efficiency measures it will employ to conserve
2 water.

3 And as a leading public sector employer
4 and corporate citizen with an obvious stake in the
5 economic progress of the communities we serve, we
6 look forward to the hundreds of jobs the company
7 will create in the future.

8 If IID can be of any further assistance
9 in moving this project forward through the scoping
10 process, you may be assured that we stand ready to
11 do so. Thank you.

12 HEARING OFFICER RENAUD: Thank you.
13 Very good. And let's see, Mark, I believe it's
14 Gran -- did I get that right? And your
15 affiliation?

16 COUNCILMEMBER GRAN: I'm a City
17 Councilmember for the City of Imperial. And I
18 have to make a disclaimer at this point in time I
19 can't represent the City Council or the City,
20 since we haven't brought this subject up in front
21 of the forum. But I'm saying this as an elected
22 official and a resident of the County.

23 I have to reiterate what Mr. Wyatt and
24 Mr. Menvielle said in that I do support this
25 wholeheartedly. We have the opportunity to build

1 a center for renewable energy. And just
2 coincidentally, I also work for a renewable energy
3 company, Cal Energy, which does geothermal. And
4 so this could be the economic driver that we need
5 in this Valley. And we look forward to your
6 support on that.

7 Mr. Wyatt mentioned that we're the
8 highest unemployment. We're also the lowest per
9 capita income. And we need industries that bring
10 jobs to the area that pay more than minimum wage.
11 And this would do that, and start to bring these
12 renewable energy companies here and show them that
13 it can be done. And we also need the Sunrise
14 Power Link to get this power out of here.

15 So we look forward to your support in
16 getting this project going. Thank you.

17 HEARING OFFICER RENAUD: Thank you very
18 much. And so far everybody's doing a great job of
19 keeping it brief so we can stay on schedule. And
20 I'll just remind everybody to keep that in mind.

21 Let me ask Marlene Best of Imperial
22 Valley Economic Development to come up.

23 MS. BEST: Good afternoon, ladies and
24 gentlemen. Thank you for coming here to Imperial
25 County; we certainly welcome you.

1 From the Imperial Valley Economic
2 Development Corporation's mission statement, we
3 are here to help promote and market economic
4 development opportunities for our county, for our
5 region as a whole.

6 We have a strong agricultural background
7 in our area which allows us to fee the nation. We
8 are very interested in supplying the opportunity
9 for Stirling Energy to help us power the nation.
10 We would like the opportunity for this project to
11 move forward. We've heard many comments already
12 about our poverty levels, our economic levels and
13 our interest in promoting and supporting those.

14 And we are here from the Economic
15 Development Corporation to support this project
16 and urge your agreement on this project.

17 Thank you very much.

18 HEARING OFFICER RENAUD: Thank you.
19 Connie Bergmark.

20 MS. BERGMARK: Hi; my name is Connie
21 Bergmark. I'm with Imperial Lakes; we are the
22 closest residential community to the project.
23 Jennifer Donovan standing with me here. We are
24 both property owners there. I've been a property
25 owner there for about 18 years.

1 We would like to say that Stirling
2 Energy came out and briefed us on the project back
3 in April. We certainly appreciate that. They
4 gave us a rundown, pretty much the same slide show
5 that we had here today. So we got to see the
6 technology and the impacts on our residential
7 community. We are very impressed, and we
8 appreciate the time that they spent with us.

9 We would encourage ongoing communication
10 on the project so we're kept in the loop as far as
11 the construction impacts, operational impacts.
12 But other than that, we support the renewable
13 energy in the Valley. And all of our homeowners
14 wholeheartedly support the project. Thank you.

15 PRESIDING MEMBER BYRON: Ms. Donovan, do
16 you want to add anything?

17 MS. DONOVAN: No, that's it. We're very
18 excited about the project. I live here full time,
19 so I also am very excited about the opportunity
20 for new jobs and new economic improvements here in
21 the Valley. So we support Stirling Energy a
22 hundred percent.

23 PRESIDING MEMBER BYRON: Thank you.

24 MS. DONOVAN: Thank you.

25 HEARING OFFICER RENAUD: Thank you.

1 Mauricio Lam.

2 MR. LAM: My name is Mauricio Lam and
3 I'm here to share a few words in support of this
4 power generation project in Imperial County.

5 Many people from other areas identify
6 the Imperial County as an area with diverse
7 economic activities, as well as having a great
8 potential to offer new opportunities to business
9 in the area.

10 We have land, we have power, water, and
11 most importantly, qualified labor. The fact that
12 Stirling Energy is interested in developing this
13 project in our community has to be well seen by
14 us. Why, many of us may ask. Because besides
15 creating jobs during its construction, which are
16 estimated to be around 700 new jobs, and during
17 its operation, estimated about to be 200, the
18 project will bring additional invaluable benefits.

19 The generation systems proposed for this
20 particular plant will not use any type of fossil
21 fuel or gases that when combusted or burned
22 generate gases that are discharged directly into
23 the open atmosphere, contributing towards the
24 greenhouse effect condition and deteriorate the
25 air quality.

1 The proposed fuel for this plant is a
2 hundred percent natural, abundant and
3 inexhaustible. It is available almost 365 days of
4 the year. I am referring to the solar energy.
5 This abundant energy that irradiates every day in
6 our region and does not contaminate.

7 Solar energy does not produce gases, and
8 we will always have a state of the art example of
9 a power plant in our community that we will see
10 improving as technology advances to make these
11 systems more reliable and efficient.

12 In a summary way I would like to
13 encourage and promote this type of projects. This
14 project, besides producing the power we use and
15 require in our daily lives, also take care of our
16 environment.

17 The most important benefit is that
18 beside ours, as a community of Imperial Valley, we
19 will be ceding a great benefit for the future
20 generations to come with this sustainable project.
21 That production of clean power is vital for our
22 future generations and provide us with a better
23 quality of life.

24 Thank you.

25 PRESIDING MEMBER BYRON: Thank you,

1 Mr. Lam. Did you have an affiliation you wanted
2 to share with us?

3 MR. LAM: Yes. I'm with Nolte
4 Associates; we're a local engineering and
5 surveying firm.

6 PRESIDING MEMBER BYRON: Thank you.

7 HEARING OFFICER RENAUD: Okay. Dennis
8 Trafecanty. Sorry if I mispronounced that.

9 MR. TRAFECANTY: Hello; my name's Dennis
10 Trafecanty. I'm with the Protect Our Communities
11 Fund, which is at the San Diego Foundation, a not-
12 for-profit fund. We embark on trying to protect
13 our communities from unnecessary developments and
14 other environmental issues and education for our
15 children.

16 I have a great deal of concern. I don't
17 mean to pour cold water on something, but I have a
18 great deal of concern about SES and their project.
19 This is like a startup. There's seven units, to
20 my knowledge, in the whole country, and in the
21 world, that are in prototype stage. And we're
22 talking about in one year approving a project.

23 There's no way on God's green earth that
24 we will ever be able to go to commercial
25 production on something like this. I'm a CFO, I'm

1 a business owner in Poway. By the way, in Poway
2 it was 82 degrees when I left today. When I got
3 here it was 82 degrees. The sun was shining in
4 San Diego; it does shine in San Diego.

5 This is also a key renewable project
6 that SDG&E has been touting for three years as a
7 basis for approval of the proposed Sunrise Power
8 Link project.

9 I understand there's a hundred million
10 of money that SES has garnered through a
11 commitment from a, I think a Danish firm, but
12 anyway, a firm from a foreign county.

13 I heard on the slides, or saw on the
14 slides that this is a \$1 billion project. So the
15 funding isn't in place. Why would you approve
16 something unless you were sure funding was in
17 place and it was a viable project.

18 By the way, I have an article here from
19 USA Today, in February. I'm happy to give it to
20 you if you want it. There's a lot of questions
21 about this project.

22 I know that Southern Cal Edison sold the
23 technology to Stirling for something like
24 \$300,000. And Edison even ordered some of these
25 units. And it's in this article. And I don't

1 think Edison wants them anymore. And part of it
2 has to do with their ability to develop the
3 project.

4 I've been involved in the Sunrise Power
5 Link project for three years. And I haven't seen
6 any changes to what's going on. Of course, I'm
7 not privy to that, but it isn't anywhere near
8 commercial.

9 So why would we want to give away 6000
10 acres of public lands to a company that's a
11 startup, that doesn't have enough money to finish
12 the project -- what prudent investor is going to
13 invest in that? Are you going to allow the
14 ratepayers to pay \$2 billion to put a line into
15 San Diego, and then ultimately up to L.A. which
16 has to be added to the cost of this? They need
17 the Sunrise Power Link, that's what they said.
18 That has to be added to the cost.

19 San Diego doesn't need any power until
20 2014, that's what the ALJ Steven Weissman said in
21 connection with the EIR/EIS hearings. We believe
22 it's 2017.

23 It was in the Wall Street Journal just
24 this week, 3 percent decline in power usage
25 countrywide. Wonder what's that go to do with?

1 Probably the economy. I know I just bought a fuel
2 efficient car.

3 SWPPL, Sunrise -- Southwest Power Link,
4 built in 1984, 24 years ago, touting geothermal.
5 Check the records. They've got 60 megawatts of
6 geothermal on the Sunrise Power Link. And people
7 here, there's the worst health hazard in the
8 country right here in Imperial Valley for
9 children, elderly and all of us in the middle,
10 because of asthma. It's that powerline in
11 Mexicali that San Diego Gas and Electric's parents
12 built. And they're bringing LNG from the far
13 east.

14 So this isn't just an open desert. The
15 powerlines will desecrate the open desert. It
16 will desecrate the remote back country wilderness.
17 Anza Borrego Desert State Park, no, it's not just
18 north county. You're going through Anza Borrego
19 Desert State Park in south county, as well.
20 Nature Conservancy just bought the land to
21 designate as part of the park.

22 So, don't endanger our bighorn sheep
23 population and the migration by going right
24 through the park. That's their only corridor to
25 the herds in Mexico.

1 So, Mr. Wyatt, geothermal, solar and
2 SES, okay. You'll be paying for the health
3 concerns of your residents of Imperial Valley
4 because when a project fails you're going to be
5 getting more dirty fossil fuel from Mexico thanks
6 to SDG&E's parents, Sempra's projects down there.
7 And you're going to have to take care of those
8 children.

9 Thank you.

10 PRESIDING MEMBER BYRON: Mr. Trafecanty,
11 I heard you say you work in Poway. Are you a
12 resident here or do you live in Poway?

13 MR. TRAFECANTY: I'm a resident in Santa
14 Isabel and I work in Poway. I'm a business owner
15 in Poway.

16 PRESIDING MEMBER BYRON: Thank you, sir.

17 HEARING OFFICER RENAUD: All right,
18 thank you. Laura McDonald.

19 MS. McDONALD: Hi, Laura McDonald,
20 representing San Diego Gas and Electric. I am the
21 Project Manager for the Sunrise Power Link
22 project.

23 And I, too, just wanted to voice my
24 support and the company's support for the Stirling
25 Energy Solar Two project. As you know, San Diego

1 Gas and Electric has an RPS mandate to meet 20
2 percent renewables by 2010. We recently
3 voluntarily supported the 33 percent goal that the
4 Governor has set forth.

5 So we're pleased to be a partner with
6 Stirling Energy on this project. We're thrilled
7 to see the project moving forward. Hopefully
8 we'll have a decision on the Sunrise Power Link in
9 the middle of December. And then we'll see both
10 of these projects go forward. Good for the
11 Imperial Valley; good for San Diego; and good for
12 the California region.

13 So, thank you very much.

14 HEARING OFFICER RENAUD: Thank you.
15 Carroll Buckley.

16 MR. BUCKLEY: Carroll Buckley, President
17 of the El Centro Chamber of Commerce and Visitors
18 Bureau. On behalf of the El Centro Chamber and
19 Visitors Bureau, thank you for visiting today.

20 The Chamber is on record with a policy
21 statement that says, in part, we support policies
22 that encourage the generation of additional local
23 energy, including production of renewable energy
24 resources for export and local consumption,
25 provided that renewable energy projects are

1 consistent with land use policies and
2 environmental impacts are fully mitigated.

3 On behalf of the Chamber of Commerce we
4 support the project. We support the jobs. The
5 fact that renewable energy sources are being
6 mandated, where are you going to build them, how
7 are you going to get that renewable energy,
8 Imperial County has the answers.

9 I have my comments in writing if you
10 would like them.

11 HEARING OFFICER RENAUD: Thank you.
12 Karen Collins.

13 MS. COLLINS: I am an anthropologist. I
14 am not associated with anybody, but I do live down
15 here.

16 To begin with I am concerned simply that
17 the energy is going to San Diego and that we're
18 not getting it. I would have thought that IID
19 would have done something about trying to get
20 something, but, you know, that's IID.

21 I am also concerned with what is the
22 life expectancy of these dish. In 50 years are we
23 going to have a bunch of abandoned large solar
24 things sitting out there in the desert? I think
25 that would be really ugly.

1 I am for solar energy. I am concerned
2 at the location because of the cultural resources.
3 The area that has been selected actually impacts
4 two areas on the National Register. You have the
5 shoreline for Lake Kuwae. We are in the middle of
6 a desert, but we used to have a great big huge
7 lake here, which basically ran from one side of
8 the ag field to the other side of the ag fields.
9 And you have the shoreline for Lake Kuwae.

10 You also have the discontinuous district
11 for the Yuha Intaglios, which are both out there.
12 So you have impacts to that. There's also a
13 number of cremations that are out in that general
14 area, too.

15 I personally believe that there are
16 other areas, particularly in some of the fallowed
17 ag lands that probably would be cheaper to put it
18 in. And from a cultural resource standpoint would
19 be a lot more economical to put it in.

20 It would also put them closer to water
21 because the west side main is the last point at
22 which water will gravity flow. So that means that
23 they're going to have to wind up pumping all their
24 water out there. It's not going to be a gravity
25 flow system like we've got in the rest of it.

1 And we don't have enough water out in
2 Plaster City to wind up doing wells, because
3 Plaster City is already having to bring in water
4 from Aquatia from the aquifer out there. So there
5 isn't the water.

6 So, those are basically my concerns.
7 Thank you.

8 HEARING OFFICER RENAUD: Tim Kelly.

9 MR. KELLY: Tim Kelly, President and CEO
10 of the Imperial Valley Economic Development
11 Corporation.

12 First of all, thank the Commissioners
13 for being here today. And I'd like to thank the
14 investment already made by Stirling Energy in
15 Imperial County. They've been a very good, I want
16 to say resident, because it seems like we see them
17 so often we think they live here.

18 But the amount of money that they've
19 already been spending in developing the project,
20 at lunch today I saw probably about 20 of them.
21 And that sales tax for our community.

22 (Laughter.)

23 MR. KELLY: They attended our education
24 workforce conference; and they gave a
25 presentation, in addition, to our energy

1 conference. The hotel rooms that they stayed in
2 were a benefit to not only the City's but the
3 County of Imperial.

4 And we support this project for several
5 different reasons. First of all, the economy, the
6 value that it's going to bring to the economy of
7 the Imperial Valley. And the ancillary businesses
8 that will need to support the SES Two.

9 The jobs that will be created. I sit on
10 the workforce development board. We've already
11 had meetings with Stirling Energy. And looking at
12 the future workforce and what the job creation is
13 going to be, and when we start developing not only
14 the training for those jobs, but also placement of
15 those jobs, and looking at funding that can be
16 available, not only through the Workforce
17 Investment Act, but also from the employment
18 training panel and other resources available.

19 In addition to that, Imperial Valley
20 College has already had meetings with Stirling
21 Energy to start adapting programs for renewable
22 energy specifically for this project. It's not
23 just one type of employee that will work the
24 Stirling Energy Systems, probably about a half a
25 dozen or more types of jobs. And those jobs are

1 going to be very high paying. And it's going to
2 need a very diverse type of training program.

3 The environment, that's probably the
4 biggest issue in Imperial Valley, PM10s. And so
5 we talked about asthma and things like that. But
6 this is actually going to be a dust mitigation
7 project. That location is the dustiest area in
8 Imperial County.

9 Stirling Energy Systems Two and the
10 other project, it's going to decrease the amount
11 of dust coming from that area.

12 Tourism. Just about every place I've
13 been in the world when people talk about what is
14 there to see, they talk about projects such as
15 renewable energy and others. And this will be a
16 project that will bring people from outside the
17 area, not only to see Stirling Energy Two, but
18 also the other projects in Imperial County such as
19 geothermal, solar and some of the other projects
20 such as biodiesel that are taking place in
21 Imperial County today.

22 And, of course, energy. The energy that
23 can be produced here goes onto the grid, first of
24 all, and will reduce the amount of energy that
25 will be needed from fossil fuels, as we mentioned

1 before.

2 But there is a demand in San Diego. And
3 so we support it for that reason. The Imperial
4 Irrigation District will also benefit, which will
5 keep the rates in Imperial County lower.

6 Thank you.

7 HEARING OFFICER RENAUD: Thank you.

8 Christina Luhn.

9 DR. LUHN: Good afternoon. My name's
10 Dr. Christina Luhn. I'm with the San Diego
11 Regional Economic Development Corporation. And
12 I'm Project Manager for a project called the
13 MegaRegion Initiative, which is a long-term
14 economic development strategy partnering San Diego
15 County, Imperial County and Baja, California for
16 global competition.

17 The key to this project is to brand and
18 market the region around targeted industries that
19 are complementary. Clean tech, which includes
20 renewable energy, is the key industry that we've
21 targeted.

22 But the underlying rationale and the
23 reason that we received a \$225,000 economic
24 development administration grant through the
25 Department of Commerce is because of job

1 creations. And not just any kind of jobs, but
2 jobs in industries that have a future. Not that
3 are on the tail-end of being obsolete.

4 So, for that particular reason, and I'm
5 from San Diego, for the energy, as well, we
6 support Stirling.

7 Thank you.

8 HEARING OFFICER RENAUD: Thank you.
9 Steve Taylor.

10 MR. TAYLOR: Good afternoon. My name's
11 Steve Taylor; I work with San Diego Gas and
12 Electric. And I am the Contract Manager for the
13 Stirling project.

14 I'm speaking in fervent support of the
15 Stirling project, since it's an integral part of
16 our efforts to meet San Diego Gas and Electric's
17 renewable portfolio standard.

18 This project is even more important
19 given Governor Schwarzenegger's recent
20 announcement of trying to have 33 percent of our
21 energy met with renewable power.

22 And, for the record, SDG&E does believe
23 in their technology. SDG&E also supports the
24 Governor's efforts to clear the red tape for
25 permitting renewable projects. And I certainly

1 look to all of you to move that spirit forward as
2 soon as possible.

3 SDG&E currently has 6 percent of our
4 portfolio coming from renewable energy. We have
5 15 percent under contract for 2010. And we have
6 21 percent for 2011. So we are well on our way.

7 SDG&E is committed to working with all
8 the parties in this proceeding to make this
9 project a reality. Thank you very much.

10 HEARING OFFICER RENAUD: Thank you.

11 Carmen, can't really read the last name --

12 MS. LUCAS: Lucas.

13 HEARING OFFICER RENAUD: Lucas.

14 MS. LUCAS: Good afternoon, I guess I
15 didn't write hard enough. My last name is Lucas,
16 L-u-c-a-s. It's really easy.

17 I am a Quimay Indian from Laguna
18 Mountain. My interest here is a bit different.
19 I'm 73 years old and I'm reflecting, after hearing
20 everybody speak, that you live long enough the
21 culture is no longer yours. I think perhaps I'm
22 at that threshold.

23 I would caution you all, even the
24 audience, we're in desperate times. Nobody really
25 knows what we're about to embark financially in

1 this country, as well as economic avenues.

2 I will only say that just because it
3 does concern me for your future, the future of
4 your children, the future of your grandchildren.

5 So when we're in desperate times we do
6 desperate things. I probably won't live long
7 enough to see this project through to its final
8 conclusion. I don't know if that's a blessing or
9 not.

10 But just to give you a little bit of
11 history, as an Indian in San Diego County, you
12 know, we lived in this environment from coast to
13 coast. That's the Pacific Ocean to the Colorado
14 River. Continuously for over 10,000 years without
15 the use of electricity, without the use of cars,
16 without the use of money.

17 But we did that with intellect that knew
18 how to work with this environment and the rhythm
19 of the environment and we moved back and forth.
20 That evidence is still on the ground, and it's out
21 there south of Plaster City.

22 I would ask you, in your process here,
23 please make it a requirement that a Native
24 American monitor be on the initial surveys of
25 these projects. We are best qualified to identify

1 sacred landscapes. We are best qualified to
2 identify the cultural resources. We are best
3 qualified to identify human remains. We don't
4 need to argue with people, we know our history.

5 I would like to thank BLM and your
6 archeologist, Carrie Simmons, for making it
7 possible for me to make a site visit out there. I
8 would have preferred to have worked on the
9 project. I think it's crucial that we have an
10 understanding it's not just Imperial County, it's
11 all of the Colorado desert region. BLM manages a
12 big part of all of it, so we're not dealing with
13 just solar projects, we're also dealing with
14 geothermal projects, SDG&E.

15 I grew up understanding that the desert
16 was a dangerous place. We saw mirages out there.
17 I can still hear my father sitting at the
18 fireplace talking about the old women burying gold
19 because we got killed for having gold.

20 I can still remember that you didn't
21 cross that desert till the evening when it was
22 safe to do that. Today we have air conditioning
23 and we take that all for granted, not really
24 realizing what the consequences of that is.

25 So these are the things I'd like to

1 bring to the record and just ask you again to be
2 very careful. I do know that in this area you
3 have an enormous deposit of pottery which tells me
4 that you have a sacrifice burial area.

5 I do know the Heritage Commission, Dave
6 Zinkelcan (phonetic) called me and asked me to be
7 here today because there were two human remains
8 that were identified in that area. The Heritage
9 Commission wants that on the record. They want to
10 know that these resources are being protected and
11 looked after.

12 I would be concerned. I know you
13 indicated in your discussion here that these
14 things won't have much ground disturbance, but I
15 would also say that's probably a plus, but I don't
16 know that it is, because you're going to have to
17 go from someplace to get them there. There's
18 going to be a lot of activity.

19 And in the past, young folks who work on
20 these projects really don't care where they're
21 going. So, there's a lot of things on that ground
22 that will be impacted. So there'll have to be
23 some way to protect those resources, particularly
24 the human remains.

25 So with that thought in mind, I thank

1 you for the opportunity to speak. And I, again,
2 would ask you to seriously consider those
3 comments. Thank you.

4 HEARING OFFICER RENAUD: Thank you.
5 Elias Felix.

6 MR. FELIX: Good afternoon, everybody.
7 My name is Elias Felix. I'm associated with Nolte
8 Associates, and I'm here today to express my
9 support for this project.

10 I believe that it will generate growth
11 for the community. It will also promote economic
12 development. And I believe it's also a great
13 opportunity for higher education to better
14 understand the energy production alternatives and
15 sustainable solutions for our communities.

16 Thank you very much.

17 HEARING OFFICER RENAUD: Thank you.
18 Donna Tisdale.

19 MS. TISDALE: Thank you. I'm actually
20 an elected Chairperson on the Boulevard Community
21 Planning Group, but I was born and raised in
22 Imperial Valley, and I own farmland here. And
23 some of it's being explored now for geothermal
24 energy. I just want to put that on the record,
25 but I'm speaking for myself, as an individual.

1 And this project is not unrelated to the
2 Sunrise Power Link project, which Imperial Valley
3 supports the southern route, which actually will
4 bulldoze its way through the eastern San Diego
5 County area, my community. And part of that
6 process, it downgrades -- BLM has downgraded
7 20,000 acres, -- resource management, to
8 accommodate not only the Power Link, but also
9 industrial wind turbines.

10 And Sunrise Power Link, SDG&E and Sempra
11 and Cal-ISO have said there's only 80 megawatts of
12 capacity left on the Southwest Power Link right
13 now. Now, Stirling and others have said that the
14 first 300 megawatts can be moved without Sunrise.

15 Well, my question is, who's telling the
16 truth. You know, is there 300 megawatts capacity?
17 Is there only 80 megawatts capacity? I know that
18 Sempra had to amend their application for their --
19 permit, for their cross-border powerline at Acumba
20 to accommodate the Cal-ISO's 80 megawatt
21 declaration.

22 Also the BLM land use amendment, I hope
23 they do it better than they did the one for
24 Sunrise through eastern San Diego County where
25 they amended the plan in a whole separate document

1 for the Sunrise Power Link, rather than a plan
2 amendment for the updated resource management
3 plan. They issued those things within days of
4 each other. We're looking at the legal recourse
5 on that.

6 Also we have Cumia Windfarm up there,
7 and promises of jobs were one of the big
8 promotions. Well, they brought in Norwegian --
9 people from Norway, to put up the turbines. So my
10 concern here is not just for the project, itself,
11 the environmental impacts, but the
12 misrepresentation to the community. This is not a
13 wealthy community.

14 And I hope they're not asking for -- and
15 I brought this up in the preapplication, I hope
16 they are not going to ask for tax breaks and tax
17 credits and incentives from this community, when
18 they should be considering building a factory
19 here, if this is what they're really going to do.
20 And they're really going to manage to make it a
21 go, why don't they build a factory here and employ
22 people here, rather than bring in people from
23 elsewhere, ship the energy elsewhere and just, you
24 know, make a few little side promises here and
25 there.

1 Because when the rubber hits the road
2 quite often promises fall by the wayside. And
3 Imperial Valley has been left in the dust of quite
4 a few of these promises.

5 I also wanted to say that I look at the
6 simulation, I drive back and forth from my home in
7 Boulevard, eastern San Diego County, to the Valley
8 for the ranch and my family, I'm worried about the
9 reflection of those mirrors on drivers. I mean
10 what about public health and safety. They say it
11 follows the sun, so if you're driving, you know,
12 -- what is the reflection rate on that?

13 We also have the Navy Air Base here and
14 I'm sure they've been brought into the loop, but
15 it is a concern.

16 Also the Division of Ratepayer Advocates
17 and the Utility Consumer Action Network have done
18 research on the Sunrise Power Link. I, myself,
19 have read about 10,000 pages of it. And they say
20 this is not in the best interests of the
21 ratepayers and cannot be justified.

22 And when you add in the cost of
23 renewable energy from projects like Stirling Solar
24 and all these industrial projects, the cost to the
25 ratepayers are phenomenal. Where are those

1 figures? We're not seeing those figures.

2 And I'm afraid in this economy, when
3 people are struggling to pay their bills and their
4 mortgages, how are they going to pay for the cost
5 of this renewable energy? That's not brought up.

6 Now, Imperial Valley, they have their
7 own utility and they may be affected differently.
8 But I pay rates in San Diego County to SDG&E and
9 California's going to have to pay for the utility
10 for Sunrise Power Link.

11 So all this needs to be taken into
12 consideration. So, anyway, thank you very much.

13 Also, cumulative impacts, 2.5 million
14 acres have been applications for right-of-way for
15 BLM lands. So, sun, wind, solar, cumulative
16 impacts.

17 Thank you.

18 HEARING OFFICER RENAUD: Thank you.

19 Edie Harmon.

20 MS. HARMON: Edie Harmon. And I've
21 lived out in the Ocotillo area for more than 30
22 years. And so when I come into the Valley I come
23 past this area. I would argue that the area
24 that's being proposed, almost more than 6000
25 acres, is not an area that's heavily impacted now,

1 and not a major generator of dust.

2 However, it is south of the Plaster City
3 offroad vehicle open area, which is a major
4 generator of dust and blowing sand. It is to the
5 east of 1000 acres that were bulldozed east of New
6 Mirage that, in times of wind, there are times you
7 cannot tell the difference between the soil and
8 the sky because there is so much blowing dust and
9 sand.

10 And when I read proposals and I've read
11 a lot of the details on this project, and I look
12 at moving parts, the dish umbrellas, and I'm
13 wondering what happens, given the fine dust -- we
14 have what we call blow-sand, which is so fine that
15 it ends up you can't even crank open windows
16 because the sand affects the cranking mechanism,
17 I'm wondering about putting 12,000, 30,000 dish
18 collectors in an area where there are really
19 strong quantities of blowing sand.

20 And I live probably less than five miles
21 from the mountains. There are times I cannot even
22 see the mountains from my house because the
23 particulate matter in the air is so great.

24 And so I think that is a real
25 consideration. It's not a dust mitigation area,

1 it's an area that's going to be very heavily
2 impacted by dust that's being generated offsite.

3 And when I go back home from the Valley
4 there are a lot of dirt roads. It's amazing how
5 much dust is generated by a single offroad vehicle
6 or a motorcycle or a pickup truck on a dirt road.
7 There's really a big plume.

8 And I think, from reading the documents
9 about the moveable parts and the mean time between
10 breakdown, between failure, and I've seen figures
11 as low as 40 hours before a unit has to be shut
12 down for maintenance, repair. I think it was the
13 CEC came out with a publication this year
14 suggesting that it would be several years before
15 they even get to the point where it's hundreds of
16 thousands of hours between time for breakdown,
17 whether it's hydrogen releases, problems with the
18 seals.

19 But also, and none of the things that
20 I've seen on failure deal with the problems of
21 what happens with dust and sand when you've got
22 moving mechanisms.

23 And I've seen winds come through that
24 will break down the limbs of a 12-inch diameter
25 tree and cause it to go down in the open desert.

1 I've seen eight-foot, ten-foot long two-by-sixes
2 flying through the air, sheets of plywood flying
3 through the air when chubascos come up from south
4 of the border.

5 I don't know what these kind -- and I
6 can be outside and five minutes later there'll be
7 a tremendous wind come through carrying things
8 through the air. I don't know whether these units
9 can close fast enough, and I don't know what
10 happens when debris, sand, dust ends up impacting
11 these mirrors.

12 I think the amount, when they're talking
13 about water for rinsing off, but what happens with
14 peak of these. And, you know, again, at the end,
15 if the project is not feasible you have a
16 tremendous amount of material that has to be --
17 has to end up somewhere.

18 As earlier speakers have said, I think
19 there's a real serious concern when you're talking
20 about going from prototype development where
21 you've got six units at Sandia National Laboratory
22 in New Mexico, which is an entirely different
23 climate, I suspect, with different vegetation, and
24 that they don't have the same dust and wind.

25 And going from a prototype of six units

1 to suddenly you're going to have 18,000 units out
2 here, exposed to the elements. And area with
3 over, when I looked at the BLM report on cultural
4 resources, I was just overwhelmed to think that
5 there would even be a serious proposal that would
6 have impacts in areas so culturally sensitive.

7 And after listening to Carmen Lucas, I
8 hope you'll realize there are a lot of people for
9 whom the past is very important.

10 And I think while we're talking about
11 renewable energy I would be far more impressed --
12 when I was at the pre -- meeting I asked, if this
13 grid-ready electricity every three units, why
14 aren't they proposing to put these units so that
15 they could generate electricity for Plaster City,
16 for the Centinela State Prison, which are very
17 close by, the hospitals, the schools.

18 Why aren't there proposals to generate
19 electricity that's going to go into the IID system
20 so that people in Imperial County, that must have
21 some of the highest per capita energy consumption
22 in the summer when it's 120, can have some
23 benefit?

24 And the answer to the question was it
25 wouldn't be profitable to use this technology to

1 generate electricity for use in Imperial County.
2 It would only be profitable if you were going to
3 build the Sunrise Power Link to transport that
4 energy to San Diego.

5 And I've seen the studies that are
6 coming out of San Diego and they're looking at the
7 potential for rooftop solar, photovoltaics,
8 distributed electricity. They've plenty of
9 parking lots, roofs, schools. A lot of people are
10 putting photovoltaic units on their homes, so
11 they're getting the energy during the day.

12 I would be far more impressed if there
13 were big energy proposals for Imperial County,
14 that we're proposing rooftop solar on all the flat
15 roofs, and to provide shade for all the parking
16 lots in Imperial County. Because that would truly
17 benefit the County and set an example for, you
18 know, technology for the future.

19 It's being done at Death Valley; it's
20 being done in places in Nevada. It's being done
21 elsewhere. I don't know why we're not looking at
22 the technologies that work rather than a
23 technology that wants more than 6000 acres of
24 public land with sensitive cultural resources to
25 turn into industrial sites to export an unproven

1 technology to San Diego.

2 I have lots of questions and I'm getting
3 them in writing. But I think there's a lot of
4 issues that have to be looked at, a good, hard
5 look.

6 And I feel like part of the reason that
7 some of these projects are coming to public lands
8 is because industry looks at public lands as a
9 less expensive way of getting the land base,
10 rather than looking at fallowed farmlands,
11 abandoned feedlots, areas where the soil is
12 sterile, parking lots or rooftops. Places where
13 there wouldn't be such impacts.

14 When you're disturbing land that has not
15 already been heavily impacted, you're reducing the
16 ability of those soils to sequester carbon. And
17 listening to Howard Wilshire, who spent 37 years
18 with USGS, he's concerned about the impacts of
19 some of these industrial-scale wind and solar
20 because they go on lands that aren't disturbed, it
21 has a negative impact on carbon sequestration on
22 those lands.

23 And I haven't heard anything or seen
24 anything on that issue related to this project.
25 But I think it needs to be looked at.

1 PRESIDING MEMBER BYRON: If I may, Ms.
2 Harmon brings up a number of issues. I'm not
3 going to try and address all of them, but I think
4 one merits just a brief explanation.

5 When we get an application from an
6 applicant we are obligated to respond to it. So,
7 she brought up a number of different issues which
8 we will consider, and the staff will look at very
9 carefully.

10 But we didn't create this application.
11 We have to evaluate it. I just want to make that
12 clear. Thank you.

13 HEARING OFFICER RENAUD: Thomas Topuzes.

14 MR. TOPUZES: Good afternoon. My name
15 is Thomas Topuzes; I'm a local businessman from El
16 Centro. Welcome to the Valley. I'm the past
17 Chair of the Imperial Valley Economic Development
18 Corporation, and also I'm the Co-Chair of the
19 MegaRegion Initiative, which you heard about a
20 little bit earlier, working San Diego, Imperial
21 County and Baja, California.

22 I support the SES solar project.
23 Renewable energy, if you've been here anytime
24 after May, June, until about the end of October
25 you realize we have a lot of radiant solar energy

1 here.

2 I think this is a good place to have the
3 project. It's going to help California meet its
4 needs for energy. It's certainly going to help
5 job creation. I understand the latest
6 unemployment rate that we have, I heard it was 27
7 percent, which is not good.

8 Also, the program provides some
9 environmental benefits, certainly you know a lot
10 more about reduction of carbon footprints that
11 I'll ever know. And also greenhouse gases.

12 But the solar energy, it's there, we see
13 it every year. We think it can help California.
14 It certainly will help our people here. The
15 location has been studied and I appreciate the
16 fact that you're here and reviewing this. And we
17 certainly hope that you support it.

18 Thank you very much.

19 HEARING OFFICER RENAUD: Thank you. Tom
20 Dubose.

21 MR. DUBOSE: Good afternoon. My name is
22 Tom Dubose. I am a co-owner of a local company
23 here called Development Design and Engineering.
24 We're a land-planning civil engineering/surveying
25 firm here in El Centro.

1 I'm also the Second Vice President of
2 the Building Industry Association, the Desert
3 Chapter. As you can imagine, that is a crippled
4 industry at this point.

5 And we need new opportunities and new
6 stimulus with which to put our people back to work
7 in building housing product.

8 I've lived here all my life. I've
9 raised my family. This is where I do business.
10 And I feel like that in Imperial County we've
11 always taken the approach of being more concerned
12 about ourselves than anyone else. And I'll give a
13 couple examples.

14 At great taxpayer expense to the
15 citizens of San Diego there was a long, drawn-out,
16 debated analysis of which to place an airport.
17 And at the end of the day when one of those
18 considerations was Imperial County, our approach
19 in Imperial County was to say that if you don't
20 want it, we'll take it. And we asked the populace
21 to vote on that. We didn't go to San Diego to say
22 you really don't want that, it's not good for you.

23 And so I get a little concerned when I
24 hear outside interests who say that they're
25 interested in our welfare. I think you will find,

1 through these hearings, that the majority of
2 people who are residents of Imperial County, are
3 going to tell you what we feel like is in our best
4 interests.

5 Because in the past we've been affected
6 by what somebody else doesn't or didn't want, but
7 you guys could take it down there.

8 As a business owner who built a new
9 office building, I tried to do the environmentally
10 right thing, and we were recognized and we
11 appreciated the District in recognizing us for our
12 energy efficiency in our new building.

13 And yet, when I get ready to solar that
14 rooftop up, I'm going to be lucky to generate
15 enough electricity for my office, much less
16 someone else's at another location.

17 As I look at some of the agencies and I
18 hear some of the agencies here over a period of
19 time, I think that we have looked upon some of
20 those agencies as a threat to our economy with
21 some of the decisions, whether it be offroad or
22 open-space use.

23 And I think this is an opportunity for
24 some of those same agencies to come to our rescue
25 and benefit us with this much-needed opportunity

1 of this new industry. This is something that I
2 think the majority of the citizens of Imperial
3 County want, and we're looking forward to, as we
4 need to continue to expand and grow opportunity.

5 We are providing, we believe, a service
6 to a lot of others, other than us. And, as
7 mentioned earlier, everybody seems to want to have
8 some of our resource. We'd like to have that
9 resource under our terms and conditions. And we
10 feel like the permitting through this process and
11 the hard work that you have to do will allow us to
12 do it.

13 The last thing I'll say is I'll not
14 profess to be an expert in something I don't know.
15 But what I do know and I'm very comfortable with,
16 as I deal with this every day, that the
17 environmental process that you are underway with
18 now will, in fact, sort out all of these issues.

19 And so when you get to that conclusion,
20 and we feel it will be positive, just remember
21 that the majority of the constituents and voters
22 and residents of Imperial County said that this is
23 something they want.

24 Thank you.

25 HEARING OFFICER RENAUD: Thank you. Do

1 you want to --

2 PRESIDING MEMBER BYRON: Yes, I
3 understand that's all the folks that have
4 indicated they want to speak at this preliminary
5 hearing or site visit, as we refer to it.

6 I'd like to thank you all very much.
7 Excellent comments, all. It gives us a good
8 sense, as Commissioners, as to what the public
9 concerns are around this project.

10 But I'd like to emphasize that no
11 decision has been made. We will be making our
12 decision based upon facts and the evidence that's
13 presented before us.

14 There's a lot of work to do. If we were
15 to think of this as a football game, it's early in
16 the first quarter here. We have a long way to go
17 before we know the outcome of this proceeding.

18 And so I think, unless my Associate
19 Member has any other comments -- none? I think
20 we're ready to go take a tour. Mr. Renaud.

21 HEARING OFFICER RENAUD: Yes, I
22 understand there are buses waiting. Are they out
23 on Main, or do we know where they are? Probably
24 if everybody just troops downstairs it'll be --
25 it'll be self-evident.

1 And we'll board those and head out as
2 quickly as we can so we still have some daylight.

3 PRESIDING MEMBER BYRON: Exactly. Let's
4 proceed post haste. Thank you, all, very much.

5 (Whereupon, at 4:15 p.m., the
6 informational hearing was adjourned.)

CERTIFICATE OF REPORTER

I, TROY A. RAY, an Electronic Reporter, do hereby certify that I am a disinterested person herein; that I recorded the foregoing California Energy Commission Hearing; that it was thereafter transcribed into typewriting.

I further certify that I am not of counsel or attorney for any of the parties to said hearing, nor in any way interested in outcome of said hearing.

IN WITNESS WHEREOF, I have hereunto set my hand this 4th day of December, 2008.

DATA RESPONSE AND ISSUES RESOLUTION WORKSHOP

6

SCOPING MEETING

98

1 THURSDAY, DECEMBER 18, 2008
2 1:15 P.M.

3 -o0o-

4 MR. MEYER: Okay. While we get our access, I
5 have a few remote staff that will be working to try to
6 follow what we are doing over the Internet. So we are
7 trying something a little new, so we're just getting the
8 bugs out on the IT stuff. So while we are doing that,
9 why don't we do some introductions on who is here.

10 And I'll start with the Energy Commission
11 staff. I'm -- My name is Christopher Meyer. I'm the
12 Energy Commission's Project Manager focusing on the CEQA
13 side, the California side of the joint BLM and Energy
14 Commission process.

15 For the Energy Commission staff I have Karen
16 Holmes who is staff counsel, Bill Walters, who is our air
17 quality expert. I have Mike McGuirt, who is our
18 archeologist on this project. And I will turn it over to
19 Jim from BLM to introduce himself and his staff.

20 MR. STOBAUGH: Hello. I'm Jim Stobaugh. I'm the
21 assigned Project Manager for the Bureau of Land
22 Management. I'm actually stationed in the -- up in Reno,
23 but I've come down to work with Vicki Wood's staff here
24 in the El Centro office that is the recipient of this
25 right-of-way application under the Bureau of Land

1 Management.

2 Vicki -- Can I ask, Vicki Wood back here as
3 the Field Manager of the El Centro Field Office here.
4 And, Vicki, let me ask you this, let me impose upon you,
5 if you would, to have your folks with BLM stand up and
6 give their name, if you would. They're hear listening as
7 well.

8 MS. WOOD: I'm Vicki Wood. I'm the Field
9 Manager.

10 MR. ZALE: Tom Zale, Associate Field Manager.

11 MS. SIMMONS: Carrie Simmons, Archeologist.

12 MS. DREYFUSS: Karen Dreyfuss, NEPA Coordinator.

13 MS. HAGGER: Jeannie Hagger, Archeologist.

14 MR. STEWARD: Daniel Steward, Resources Branch
15 Chief.

16 MR. STEIN: I'm Al Stein. I'm Chief of Resources
17 in BLM's District Office in Moreno Valley.

18 MR. STOBAUGH: Did we get everyone from BLM?
19 Thank you very much. I wanted some of you folks to see
20 the faces with the names here. They will be involved
21 with this project. And that's it for the Bureau of Land
22 Management. Thank you.

23 In case -- Christopher is going to talk about
24 this a little bit, but the first -- for those of you who
25 have seen the announcement, the first part of this

1 meeting is the Data Response and Issues Resolution
2 Workshop, which CEC is largely heading up with BLM
3 assistance here. Then in the afternoon after we have a
4 break from 5:00 to 7:00 is more geared to what BLM's
5 requirements in running through the National
6 Environmental Policy Act process, and that's scoping, of
7 which this is the second scoping meeting, in fact, held
8 in this very room; we had the first scoping meeting on
9 November 24th. This will be the second and the final
10 scoping meeting -- public scoping meeting we have. And
11 you will be provided an opportunity after five o'clock to
12 present any verbal comments you wish to have.

13 Let me ask anybody that's wanting to speak at
14 that session, if you will go out front, if you haven't
15 done so already, and please sign in one of these cards
16 right here that's talking about Solar Two Project Forms,
17 so we get your name, who you represent, and your contact
18 information to follow up with. Okay. That's all I
19 really have, Christopher.

20 MR. MEYER: I'll turn it over to the Applicant to
21 introduce themselves and their staff.

22 MR. HARPER: Hi, I'm Kevin Harper. I'm the
23 Project Manager for Solar Two, or for Stirling Energy
24 Systems. We have a number of people here today to help
25 us with the responses and all as we go through the

1 information at the workshop here today. And a number of
2 them will engage you today and talk with you about some
3 of the responses that have been provided.

4 I'll introduce some of them real quickly
5 here. We have Angela Leiba who is the URS Project
6 Manager. We have John Egan who is our Senior Director
7 for Project Development. In the audience here we have
8 Emily Bierman, who has been great help with public
9 involvement. She's done the story boards you see here in
10 the back of the room, which I hope you get to look at at
11 some point during the meeting.

12 We have Julie Mitchell with Air Quality; Pat
13 Mock with Biological Resources; Teresa Miller with
14 Biological Resources; Brian Glenn with Cultural
15 Resources; Bob Mutaw with Cultural Resources; Ginger
16 Torres with Land Use; Seth Hopkins with Associated
17 Economics and Visual Resources; Noel Casil with Traffic
18 and Transportation; Matt Moore, Water Resources; and last
19 but not least Tricia Winterbauer, Waste Management by
20 phone when we actually get her, so thank you.

21 MR. MEYER: I think what we are going to have to
22 do is try to hit some of the topics where we have
23 people --

24 MR. FOLEY: Can I introduce myself?

25 MR. MEYER: Oh, I'm sorry. We have a

1 representative from one of the intervenors here, who will
2 introduce himself.

3 MR. FOLEY: My name is Paul Foley, and I'm here
4 on behalf of California Unions for Reliable Energy, and
5 we've been granted intervenor status in this proceeding
6 and will be fully participating as a party.

7 MR. MEYER: Okay. Can the people on the line
8 actually hear me?

9 (IN UNISON): Yes.

10 MR. MEYER: Okay, wonderful. Okay. For those of
11 who you who are not familiar with the kind of data
12 response issues resolution workshops that the Energy
13 Commission holds, what is this is is what we refer to as
14 the discovery phase of our -- of the Energy Commission
15 process, very similar to the BLM process, where we are
16 trying to gather additional information that we felt was
17 not either completely explained or staff had additional
18 questions in reviewing the application from the
19 applicant.

20 And so in the first phase of this, staff
21 provided 52 requests in various technical areas to the
22 Applicant. And they -- On the 9th of this month they
23 provided responses. This is an opportunity for staff in
24 the public forum, both Energy Commission and Bureau of
25 Land Management staff, to ask clarifying questions of the

1 Applicant on any area that we weren't completely clear on
2 what their responses were or if we had some additional
3 follow-up issues.

4 So our process, you know, we try for complete
5 transparency, and this is an opportunity for the public
6 to see exactly what the issues are on the case very early
7 on in the process.

8 The results of these data requests will help
9 us produce our preliminary documents. It will be a joint
10 BLM/Energy Commission document, which we will call
11 Preliminary Staff Assessment/Draft Environmental Impact
12 Statement. So, and the whole focus between Jim and I on
13 this is to produce one document that everyone can review
14 on the whole process, both on the Energy Commission side
15 and on the BLM side.

16 So usually what I try to do is we have
17 several people on the phone that have joined us. I have
18 -- Let me just double check to see who has been able to
19 join us. I have Joy Nashida. Who is the Energy
20 Commission's biologist working on this case. Heather
21 Keresztes, who is the Energy Commission's traffic expert
22 on this case. And Negar Vahidi is doing land use on this
23 case. And I also have Casey Weaver, who's in charge of
24 soil and water.

25 And what I will tend to do, some of these

1 areas are fairly minor, so I would like to get through
2 those first and then step back to some of the more
3 complicated issues.

4 So I'd like to look at biology first. And
5 that is going to be -- start with Data Request #1, and
6 I'm going to put my mic over and see if you can hear Joy
7 on any questions she has.

8 And, Joy, I'm going to turn this over to you.

9 MS. NASHIDA: Okay. Let's just start moving on
10 here. I don't need anything for -- for the following
11 Data Requests: 1, 2, and 3, 4 at this point. A lot of
12 these things we need to work out, you know. These are
13 documents or whatever that need to be dealt with down the
14 line. These are things -- documents with the joint BLM
15 documents that have to be worked out with that agency.
16 So we can go ahead and move on. I would like to start
17 with Data Request #5, okay. Can you guys hear me okay?

18 MR. MEYER: Yes, you're coming in well.

19 MS. NASHIDA: Okay. All right, you know what?
20 Here I asked -- my Data Request was regarding a detailed
21 marketing plan for the evaporation ponds. And, you know,
22 I -- I'm not certain, where are the evaporation ponds
23 going to be located on the project site? What are the
24 dimensions of these evaporation ponds? You know, what
25 slopes -- the steepness of the slopes of the evaporation

1 ponds? What is the free bore, what will it be lined
2 with? All these questions here I have for the
3 evaporation ponds. So some clarification on that would
4 be great.

5 MS. LEIBA: I have Pat Mock here, our Senior
6 Biologist, who can respond to that.

7 MR. MOCK: Well, I think it's really -- if, John,
8 if you can describe where the actual ponds are going to
9 be sited. I don't think it was clear.

10 MR. EGAN: The ponds are very close to the main
11 operation building. I don't have a map available to put
12 on the screen right now to show you, but they're quite
13 close to the main building.

14 MR. MOCK: And in terms of monitoring the
15 evaporation ponds, I think the intent was to, one,
16 evaluate the constituencies of the evaporation pond
17 fluids to confirm whether there was any trace elements
18 that were being concentrated that might be harmful to the
19 wildlife. And if we did find some accumulation of trace
20 elements such as selenium, or things like that, that
21 would be of concern and then we would monitor the pond
22 constituency for at least a quarter or two to confirm
23 that there was definitely a risk or not.

24 And then, also, we could be monitoring the
25 actual use of the ponds by wildlife and see if there is

1 any risk at all for those ponds. And if there was a risk
2 determined, then we would develop some kind of a covering
3 design to exclude the wildlife from the ponds.

4 MR. HARPER: If I could interject, also, is there
5 something with BLM, for instance, looking at the
6 evaporation ponds, is there anything that we could look
7 at as far as proactively as part of the process in
8 managing those evaporation ponds that might be of use for
9 us to consider now or talk about as a part of this
10 response?

11 MR. STOBAUGH: Right now at this time largely we
12 are looking at listening on what is going on between the
13 CEC and the Applicant and gathering this information
14 ourselves. Unless somebody, you know, is prepared to
15 otherwise advise, no.

16 MR. HARPER: One thing I was thinking of is
17 possibly some regular testing, for instance, of the
18 water.

19 MR. MOCK: We recommended quarterly testing as
20 part of our proposal.

21 MR. HARPER: Okay. Good.

22 MR. STOBAUGH: We are capturing all of this right
23 now as far as everything that is being discussed here and
24 as far as our own considerations as well in working
25 toward the administrative draft EIS so.

1 MR. MOCK: Any other questions, Joy?

2 MS. NASHIDA: Yes. So any idea on dimensions of
3 these ponds?

4 MR. MOCK: That's another design question. How
5 large are the ponds?

6 MR. HARPER: Actually, what I would like to do is
7 ask Ned Araujo from Stantec, if he could provide some
8 information. He's actually been working on the design of
9 the actual projects.

10 MR. ARAUJO: Good afternoon. My name is Ned
11 Araujo. I'm with Stantec. I'm the civil engineer for
12 the project. As far as the evaporation ponds, they're
13 currently sited just north of the main buildings, at the
14 main services complex.

15 MR. MOCK: How big are they?

16 MR. ARAUJO: The size hasn't been determined
17 specifically at this point. However, the intent is to
18 use 4:1 site slopes. And the size would be sized
19 appropriately to basically have complete storage of the
20 water for one year. And we were planning on having two
21 separate ponds where we would have basically one year
22 storage in one and switch it over to the second one.

23 MS. NASHIDA: Okay. Can you please repeat what
24 did you say about the slopes of these ponds?

25 MR. ARAUJO: The slopes for the ponds are planned

1 at 4:1, all slopes.

2 MR. MEYER: Did you catch that?

3 MS. NASHIDA: Yes, I got that, 4:1. Okay, here
4 is -- okay, as far as a wildlife standpoint goes, the
5 steeper the slope, the better, just because you have less
6 shoreline for wading birds to be able to -- to go through
7 there. The steeper it is, the less attractive it is to
8 these wading birds, and it becomes less of an issue with
9 certain birds. So I just wanted to throw that in there
10 right now.

11 MR. ARAUJO: Do you have a slope that you would
12 like to see at this point? We were planning on lining
13 those basins, so we could go 2:1, if you feel that that's
14 appropriate.

15 MS. NASHIDA: Okay. You know what? Let me get
16 back to you on that. And it's good to hear that you can
17 go 2:1. But, you know, I will definitely need to find
18 out more specific information on that. All right?

19 MR. ARAUJO: Great. Thank you.

20 MS. NASHIDA: All right. Thank you. And you
21 said the ponds would be totally lined, correct?

22 MR. MOCK: Yes.

23 MR. NASHIDA: And will there be monitoring for
24 any leakage from the ponds?

25 MR. MOCK: I think that could be accommodated by

1 the program.

2 MS. NASHIDA: All right. Great. Thank you.

3 MR. MEYER: Okay. Joy, does that take care of
4 your questions?

5 MS. NASHIDA: Yes, for Data Request 5, yes.

6 MR. MEYER: Okay. For anyone that didn't hear
7 that, she said, yes, for Data Request 5. Do you have any
8 further data requests you need clarification on?

9 MS. NASHIDA: Yes. Okay, I'd like to go on to
10 Data Request -- Okay, this has to do with closure here.
11 So BLM has a lot of issues with abandonment on public
12 land, and that's something that they -- they need
13 assurances that this isn't going to happen.

14 One of the things we need to discuss, I
15 guess, is regarding Data Requests 8 and 9, and it has to
16 do with how in case -- in case the company goes belly up
17 and there isn't any money, you have no more money for the
18 project to be decommissioned. They essentially want
19 assurances that this isn't going to happen -- not so much
20 go belly up, but they want assurances that the money is
21 going to be there to take apart the solar plant.

22 So anyway, one of the -- one of the responses
23 to my question was regarding potential funding for
24 decommissioning and restoration of the project site.
25 This is Data Request 9. I was talking to my BLM

1 counterparts, and they -- I'm afraid the scrap value of
2 metal, steel, and copper isn't going to cover the cost
3 for decommissioning. And what the BLM really needs is a
4 bond to deal with this. And so the Applicant needs to
5 discuss with BLM a plan on how to get this -- get this
6 going.

7 MR. HARPER: Yeah. We are planning on actually,
8 you know, we are right now developing a closure plan for
9 the project. And it's something that I think has even
10 come out of the solar thermal power plant guidance for
11 PODs, also, Joy, I'm not mistaken, that you have to have
12 that as a part of it.

13 As far as with funding beyond just scrapping
14 the equipment and all, yeah, there is a bond with BLM
15 that we will be looking at, negotiating that with them.
16 And, Jim, do you want to provide any more information
17 about that?

18 MR. STOBAUGH: Yeah, we've talked a little bit
19 about that, you know, this morning. Bonding would be one
20 of those conditions or stipulations as part of the grant
21 itself. And the determination is to be made by the BLM
22 as a part of the condition of the grant.

23 And the way it has to be looked at,
24 especially if we are talking about a, hopefully, not an
25 insolvent situation, is what would it take the Bureau to

1 decommission and reclaim those lands to bring them back
2 the way it was prior to its management. So those figures
3 would have to be determined based upon information we
4 have of similar types of actions such as a mining
5 reclamation, or something of that nature, or components
6 thereof, that we would have made available to us to see
7 what the size or figure of the bond would be as part of
8 the condition of the grant issuance.

9 MR. EGAN: Jim, just one comment on that. Our
10 intent from the start really wasn't to rely totally on
11 the scrap value. The idea here, we have no idea what
12 scrap value will be 20, 40 years out. But the idea is
13 that scrap does have value. So the hope would be to
14 reduce the bond slightly, or some, by using scrap value.
15 Because these pedestals can be withdrawn from the ground
16 and quite a bit of steel can be recovered.

17 MR. STOBAUGH: Again, the figure at the time of
18 issuance of grant is what would it take the Bureau at its
19 current knowledge to reclaim that. So if there is
20 compensation, if you would, that could be redeemed from
21 that, maybe so; but it's not the factor that's coming up
22 with the figure that we would be using.

23 MR. HARPER: Just to go a little further, I would
24 say that if there is anything beyond just the bonding
25 issue that, you know, can be determined later, if there

1 are things in the decommissioning plan that you would
2 like the Applicant to satisfy, if there's a list of
3 items, if those things could be forwarded to us, that
4 would definitely help our consultant in making sure it
5 meets, you know, what BLM and CEC require for that.

6 MR. STOBAUGH: Kevin, in response to that, part
7 of what is the process is you have the application for
8 certification, which we are using in gleaning parts of it
9 there for our plan of development. Eventually the plan
10 development, which has some dynamics until all parties
11 know what is involved with this project, its plan, its
12 construction, operation, and even decommission, we'll
13 eventually get to that point to where we will develop a
14 final plan of development which will be one of those
15 other, and if not the most critical stipulation with the
16 issuance of the grant. So we will have those established
17 at that point.

18 MR. MEYER: Okay. Joy, does that cover the
19 question on that?

20 MS. NASHIDA: Yes, it did. Okay. Daniel, do you
21 have any comments to that?

22 MR. STEWARD: I'm good.

23 MR. MEYER: He's saying that he doesn't have any
24 additional comments.

25 MS. NASHIDA: Okay. All right. So this takes us

1 right to Data Request 11, and I think this was answered
2 with regard to the discussion regarding closure
3 requirements. This will be need to be done sooner rather
4 than at the time of decommissioning, so this is something
5 that needs to be worked on, worked on with BLM and CEC.
6 Essentially, we should get going on that soon here.

7 MR. HARPER: And the Applicant will make every
8 effort to make sure that when we look at the local
9 ordinances and in working with the County and also with
10 the other agencies, to comply with what they provide as
11 far as guidance in looking at decommissioning plans.

12 MR. MEYER: Given the construction we have for
13 the project we have a little bit of time before we start
14 pulling things down. Okay, thank you.

15 MS. NASHIDA: All right. And I think as far as
16 any other questions, I think -- I think I don't -- I
17 think everything is pretty much answered. I don't have
18 anything else to add and, you know, I'll let other
19 reports that are supposed to be -- are forthcoming later
20 on in the first quarter of 2009, so I will be awaiting
21 those. And I think I'm fine. Unless Jesse and Daniel
22 have anything else to add, then I think I'm done.

23 MR. MEYER: Okay. I think that's all the
24 comments we have.

25 MR. HARPER: So does that take care of 1

1 through --

2 MS. NASHIDA: One through fifteen.

3 MR. MEYER: That takes care of Data Requests 1
4 through 15 for biology.

5 MR. BAKER: Christopher?

6 MR. MEYER: Yes?

7 MR. BAKER: This is Steve Baker. I would just
8 like to check in. I'm ready when you have time.

9 MR. MEYER: Okay. Steve, I think you just had
10 one. Do you want to hit your -- you had three data
11 requests while I have you available?

12 MR. BAKER: Sure.

13 MR. MEYER: Steve Baker is the Energy Commission
14 specialist on several areas, including power plant
15 efficiency. So go ahead, Steve.

16 MR. BAKER: Okay. In the responses to Data
17 Requests 24 and 25, you gave a volume of hydrogen as 196
18 cubic feet and 200 cubic feet per year, but without the
19 pressure that's meaningless. You know, in order to know
20 how much hydrogen we're talking about, we have to know
21 what pressure you're measuring that volume at.

22 MR. HARPER: Yeah. We'll provide that
23 information for you.

24 MR. BAKER: In Data Request 26, you say that you
25 use 24,400 thermals of natural gas. In what time period?

1 Is that per year per month, per day, per hour?

2 MR. HARPER: Yeah. We'll look at that and see.
3 We'll try to come back to that during our time here.

4 MR. BAKER: That's all I had, Christopher.

5 MR. MEYER: Okay. Thank you, Steve. If you're
6 not able to stay with us, I will take notes on that and
7 get the information to you.

8 MR. BAKER: Thank you. Bye.

9 MR. MEYER: Thank you, Steve. Okay.

10 MR. FOLEY: Christopher?

11 MR. MEYER: Yes.

12 MR. FOLEY: Before -- If we are going to move on
13 from biological, maybe I will just ask a few clarifying
14 questions now.

15 MR. MEYER: Yes.

16 MR. FOLEY: I know we didn't spend any time on
17 Data Request 1, which had to do with jurisdictional
18 waters. I just wanted to clarify what the document that
19 was provided is. Is this for a preliminary
20 jurisdictional determination or is this for an approved
21 jurisdictional determination, the application that was
22 provided in the data response?

23 MR. MOCK: We filled out a jurisdictional form
24 that the Corps requested of us, and it was filled out to
25 be determined whether our jurisdiction was appropriate or

1 not.

2 MR. FOLEY: So it was for an approved
3 jurisdictional and not a preliminary jurisdictional --

4 MR. MOCK: Yeah. We are not assuming preliminary
5 on this.

6 MR. FOLEY: Okay. And the other question I had
7 is on this page there's a box checked off concerning --
8 it says, "Check if other sites are associated with this
9 action and recorded on a different JD form." And that's
10 checked, so I just wanted to know, are there other JD
11 forms out there that are associated with this project?

12 MR. MOCK: That's a mistake. That should have
13 been unchecked. It's only one site and so the only
14 channels that we're evaluating are the ones that are
15 actually on the site itself.

16 MR. FOLEY: You're not requesting anything for
17 the linear?

18 MR. MOCK: They won't be affected since there's
19 no linears associated with the transmission line that we
20 are going to be affecting; they will be spanning those.

21 MR. FOLEY: And what about the water line?

22 MR. MOCK: I don't believe there are any --
23 offsite, I don't believe there's any --

24 MR. FOLEY: What I'm asking is, is a
25 jurisdictional determination being requested for either

1 the transmission line or the water line?

2 MR. MOCK: Possibly for the water line, but I
3 don't believe there are any channels associated with the
4 water line that are off-site. All the channels that we
5 identified are on-site.

6 MR. FOLEY: And I don't know if BLM has the
7 answer to this of whether any other jurisdictional
8 determinations have been sought associated with this
9 project by BLM with the Army Corps?

10 MR. STOBAUGH: At this time, I don't know.

11 MR. FOLEY: I mean, in terms of the FNZI that was
12 issued for the geo-technical.

13 MR. STOBAUGH: I would have to pan back and see.
14 I'll say this, let me just take note of that and get an
15 answer to you.

16 MR. FOLEY: Okay, great. I just had a couple
17 more questions having to do with biological. Now, is it
18 correct that there isn't any data out that there SES has
19 in terms of the scrap value of the metal? I understand
20 that this is going to be part of the closure plan, and I
21 just wanted to understand if as part of this Data Request
22 this information will be provided in the closure plan or
23 will there just be kind of an assumption that it has some
24 value?

25 MR. EGAN: I think at this point it will have

1 some value. The trick is how to put a value on something
2 that goes 20 to 40 years out. We will probably put a
3 fair market value based on current production numbers and
4 try to inflate it using the implicit price inflater.

5 MR. FOLEY: So you will provide present value?

6 MR. EGAN: Present value at the start, and we
7 should also inflate it.

8 MR. FOLEY: And it will have a geographic
9 weighting in terms of where the scrap metal would be
10 headed to because I know that's a big issue?

11 MR. EGAN: Yeah, I understand. That's a decent
12 thought.

13 MR. FOLEY: Okay. That's all I have for
14 biological.

15 MR. MEYER: Thank you very much. Okay. I think
16 at this point why don't we hit I think soil and water
17 resources. Casey, are you available?

18 MR. WEAVER: Yeah, I'm here.

19 MR. MEYER: Are you ready to ask any questions on
20 yours?

21 MR. WEAVER: Yes, sure.

22 MR. MEYER: Casey Weaver is the Energy
23 Commission's staff working on soil and water resources.
24 And this starts with Data Request 29, and I'll turn it
25 over to you, Casey.

1 MR. WEAVER: Okay, thanks. Hello, everybody.
2 Let's go right into Data Request 31. The request was to
3 submit a draft erosion sediment control plan. And the
4 response was that it will show up in the first quarter of
5 2009.

6 You know, we need to have the document in
7 order to evaluate it, to perform our analysis on it, so I
8 assume that that will be timely for the due date of our
9 analysis. Is that an accurate statement?

10 MS. LEIBA: Yes. This is Angela Leiba. I
11 thought I would just answer for Matt Moore, our water
12 resource expert. Yeah, we're currently working with the
13 engineers to develop the DES/SEP, so we do anticipate
14 that in the first quarter of 2009 we will have a prepared
15 analysis and incorporation.

16 MR. WEAVER: That's got to be a daunting project.

17 MS. LEIBA: Yes.

18 MR. WEAVER: Well, I'm looking very forward to
19 seeing that. I guess it would be the same comment on
20 Data Request 32.

21 MR. MOORE: Yes. This is Matt Moore with URS.
22 It will be a combined DES/SEP and storm water pollution
23 prevention plan.

24 MR. WEAVER: Right. And do you have any idea
25 when in the first quarter of 2009 that would be?

1 MR. MOORE: Not at this time, we can keep you
2 updated on our progress as we move forward.

3 MR. WEAVER: You know, my only concern is that I
4 will have to review it, analyze it, digest it, all the
5 things that we have to do with it prior to completion of
6 our PSA.

7 MR. MEYER: Casey, does it give any value if
8 there is anything in draft form for you to look at
9 earlier or is it easier to look at all at once?

10 MR. WEAVER: Yes, it would. And as far as the
11 PSA, I think, and the FSA would have to be completed.
12 But in the PSA, I mean, really kind of seeing an outline
13 even that, you know, you are addressing all the specifics
14 and we are both on board with where you are going with
15 it, I think it would be of benefit.

16 MS. LEIBA: I think what we could do is at least
17 provide a table of contents for the joint DES/CEP, to
18 make sure that we're including everything that both
19 agencies want to have.

20 MR. WEAVER: I think that would be really
21 helpful.

22 MR. MOORE: Casey, this is Matt Moore again.
23 Stantec is, you know, preparing a storm water pollution
24 prevention plan to go along with the preliminary
25 engineering 35 percent design, which is going to be

1 coming out mid-January. So that may be something we
2 could get to you in a draft format.

3 MR. WEAVER: Sure. That sounds good. You know,
4 looking at the size of that, you know, that's a huge job.
5 I'm wondering if you are going to do it, you know,
6 individual tower level or concept, you know, procedure.
7 You know, I'm curious to see how you are going to tackle
8 that.

9 MR. MOORE: Yeah. We can work with you on that
10 or get you an outline of how we are going to proceed.

11 MR. WEAVER: That sounds good. Appreciate that.
12 Okay, in Data Request 33, the request was to provide the
13 schedule and estimated average in maximum water use for
14 the mirror washing. And you did a good job on discussing
15 the average. You know, you went through all that. But
16 we need really a description of the estimated maximum.
17 That's kind of the hinge point of what we look at. You
18 know, average is good so that you can kind of see what is
19 out there, but we really need to see the maximum.

20 MR. HARPER: Yeah, we will get you that
21 information.

22 MS. LEIBA: We have those numbers from the AFC;
23 they are included in there. I have some of those with
24 me, if you want me to go through those.

25 MR. MEYER: And just for the members of the

1 public, it is sort of the subsequent information we get
2 in, you know, follow-up to questions that any of the
3 parties may have, that will be docketed so that it's
4 available for the public as well.

5 MR. WEAVER: Okay. Then Data Request 34, we
6 asked for a description of management measures that U.S.
7 Gypsum employs. And the response was that there is an
8 EIS publicly available. Do you have a reference for that
9 or an electronic version?

10 MR. HARPER: Yeah, we can provide you that as
11 well.

12 MR. WEAVER: Okay, that would be good. One last
13 thing is the water budget. You did a good job on the
14 construction, but we need the operations water budget as
15 well.

16 MR. HARPER: Okay. Yeah, we will work that up
17 for them as well.

18 MR. MOORE: To clarify, is that -- you are
19 referring to Data Request 36?

20 MR. WEAVER: Yes, that's correct.

21 MR. HARPER: So 35 was fine, then?

22 MR. WEAVER: Yes. I'm sorry, yes. Thirty-five
23 looked pretty good.

24 MR. HARPER: Okay.

25 MR. WEAVER: Yeah, 36 and, again, the

1 construction looked fine. We just need an operations
2 water budget as well.

3 MS. LEIBA: Yeah, again, we have that in the AFC
4 but we can provide that again.

5 MR. WEAVER: I didn't hear that.

6 MS. LEIBA: I'm sorry, this is Angela Leiba from
7 URS. We have that information in the Application for
8 Certification, but we can pull that up again and make
9 sure we provide that to you.

10 MR. MEYER: Okay. How do the other ones look,
11 Casey, 37, 38?

12 MR. WEAVER: Yeah, just say that again,
13 Christopher.

14 MR. MEYER: How do 37 and 38 look?

15 MS. LEIBA: Well, actually, 37 and 38, the
16 Applicant, we've asked to have more time to respond to
17 those.

18 MR. WEAVER: Okay. That's all I have.

19 MR. MEYER: Okay. Thank you very much, Casey.
20 Before you go, Casey, any other questions from the
21 parties on soil and water resources?

22 MR. FOLEY: I have just a few questions.

23 You mentioned the preparation of a slip. Is
24 that going to be -- Is that anticipated to be for a
25 general storm water construction permit?

1 MR. MOORE: That's correct.

2 MR. FOLEY: Has the local water control board
3 been contacted yet in terms of what their requirements
4 are?

5 MS. LEIBA: It's part of the process. The
6 regional board and all of the agencies that would be
7 required to view it would be part of the process to see
8 what we are doing.

9 MR. FOLEY: I understand that, but they have not
10 been contacted yet?

11 MS. LEIBA: Well, through the CEC process they've
12 come on board as one of the agencies that will be
13 reviewing all of the documents in relation to the
14 project. And so they will be on board and they have been
15 from the beginning.

16 MR. FOLEY: Okay. I mention this only because,
17 obviously, it's their discretion whether or not to issue
18 a general as opposed to an individual construction
19 permit. So I was wondering if there has been any contact
20 in terms of their analysis of the project.

21 MS. LEIBA: At this point I don't think we have
22 any determination yet.

23 MR. FOLEY: And, also, in terms of the
24 information that's being sought from U.S. Gypsum, is
25 there an air permit that will be obtained that presumably

1 U.S. Gypsum retains?

2 MS. LEIBA: We should get into that with air
3 quality. Is that okay?

4 MR. FOLEY: Sure. Yeah. That would be part of
5 the dust mitigation, and my understanding is that only an
6 EIR is only been sought at present in response to the
7 data request.

8 MS. LEIBA: I'm unclear what U.S. Gypsum is doing
9 at this time. But maybe once we get to the air quality
10 section we can talk about dust and air emissions with
11 respect to an air permit.

12 MR. FOLEY: Okay.

13 MR. MEYER: Does that take care of it?

14 MR. FOLEY: Yes.

15 MR. MEYER: Thank you, Casey.

16 MR. WEAVER: You're welcome.

17 MR. MEYER: Okay. We have Heather available.
18 Heather, did you have any questions on the traffic and
19 transportation data responses?

20 MS. KERESZTES: No, I'm fine. Thank you.

21 MR. MEYER: Okay. So staff has the data
22 responses from the Applicant and doesn't have any
23 additional questions on that. I can also just sort of
24 for a little housekeeping, on the project description and
25 socioeconomic, staff has reviewed the data responses and

1 doesn't have any additional questions at this point.

2 And on visual, I think we have the
3 information we need on visual. There might be a very
4 minor clarification. Staff, unfortunately, are on
5 another project at the moment. And I think it's just
6 they want to verify that the one KOP that was provided
7 that the fence is not visible from any of the other KOPs.

8 MS. LEIBA: And I think we have at this time
9 redone the simulation to incorporate fencing.

10 MR. MEYER: Okay. Great. Thank you very much.
11 That would close out the visual at this time. Do any
12 parties have any questions on visual?

13 MR. FOLEY: No.

14 MR. MEYER: No.

15 MR. HARPER: You know, I just want to make sure,
16 again, because we ran through several resources there,
17 just to ensure that BLM didn't have any further
18 information requests or needs, also, for the different
19 resource areas?

20 MR. STOBAUGH: Not at this time, no.

21 MR. MEYER: Okay. Why don't we hit land use.
22 Negar, are you ready to ask any questions on land use
23 which starts with Data Request number 16?

24 MS. VAHIDI: Yes. Can you hear me?

25 MR. MEYER: Yes, we can.

1 MS. VAHIDI: Okay. First, thank you for your
2 responses. I just need to clarify something. I'm not
3 sure if you have the ASP in front of you. If you could
4 go to page 5.9-4, I know that -- the question -- the Data
5 Request 16 asks for a little bit of clarification on the
6 amount of project-related private land acreage which is
7 under Imperial County jurisdiction.

8 I have found two numbers quoted, 360 and 480
9 acres. And you responded by saying 360 acres. But I was
10 wondering if you could clarify a statement that's on page
11 5.9-4, which states that there's a total of approximately
12 720 acres of private parcels within the project
13 boundaries, of which approximately 480 acres are included
14 as part of the project.

15 And then it says, the remaining 240 acres are
16 not part of the project. These lands are under the
17 jurisdiction of Imperial County. I'm a little unclear on
18 what that means.

19 MR. HOPKINS: That just means that they are
20 private parcels under the jurisdiction of the County.

21 MS. VAHIDI: I'm sorry, I can't hear you very
22 well.

23 MR. HOPKINS: That just means that they're
24 private parcels under the jurisdiction of the County of
25 Imperial.

1 MS. VAHIDI: What is, the 480 acres or the --

2 MR. HOPKINS: No. The portions of private lands
3 that are not a part of the project, the remaining 240
4 acres that are not part of the project.

5 MS. VAHIDI: But they're within the project
6 boundaries?

7 MR. HOPKINS: Yes.

8 MS. VAHIDI: So what does that mean? So, if they
9 are within the project site boundary, are you saying that
10 there is no activity on those 240 acres?

11 MR. HOPKINS: Yes.

12 MS. LEIBA: Yes, Negar, as clarification, it is
13 kind of confusing. There are private parcels within the
14 project boundary that are considered not a part of the
15 project, and those are the numbers that Seth and Ginger
16 have written in the land use section.

17 MS. VAHIDI: Okay. The reason I need to get
18 clarification is because we need to, you know, describe
19 the land disturbance impact accurately, which will be
20 beneficial to everybody.

21 So I guess just to get confirmation, you're
22 saying 360 acres of private land only under jurisdiction
23 of Imperial County that are part of the proposed project.

24 What is odd to me is if you have a -- I guess
25 this is what I'm confused on. Usually when you have a

1 project site it's considered, you know, regardless of
2 whether you are doing anything on it or not, you are
3 going to acquire it for the project and it's part of the
4 project, even if you are not -- if have no activities on
5 it.

6 MR. HARPER: Yeah, if I could, I think what we
7 are trying to do here is that right now we are working
8 with the different property owners there, looking at
9 leases, purchases for some of those properties. But
10 right now we are considering those not a part of the
11 project so.

12 MS. VAHIDI: So you are not going to gain -- I
13 don't understand that. Is it that you are not going to
14 get site control over those?

15 MR. HARPER: Right. There is a part of the
16 property -- There is a large block of property there that
17 is private and then another smaller property that is 80
18 acres. Some of that private parcel there, it's owned by
19 several different owners, of course, some of those we are
20 working on an agreement that will be a part of the
21 project. And then there's another part of it there that
22 is not a part of the project. It's not something that we
23 are currently seeking right now with the private
24 landholders.

25 MS. VAHIDI: So, again, if it's not part of your

1 project and you're not going to seek site control, why
2 would you consider it part of your project boundary?

3 MS. LEIBA: Well, it's just within the project
4 boundary.

5 MR. MEYER: You know, I think I can -- Negar, I
6 think I can clarify. Several of these projects, just
7 because of their size, you know, you are drawing a big
8 square and of that acreage there are parts in the middle
9 that are outside. They are not part of the project but
10 they just happened to get sort of surrounded by the rest
11 of the project.

12 MS. VAHIDI: Well, that I understand. One of the
13 reasons I asked this question, which leads me to the rest
14 of the data requests that I'm going to ask for
15 clarification on, is the issue of site control is pretty
16 important to the Commission. And we are going to have to
17 -- the Commission is going to want to see in the land use
18 PSA what you are going to do about site control as
19 definitively as you can. And if you can't, we are going
20 to have to condition it. So that's why I'm bringing up
21 this issue because it's come up on recent cases. You
22 know, we are just trying to be proactive so we stay on
23 schedule, you know what I mean.

24 So with that said, that's the reason for
25 trying to get as specific as we can. Which goes -- takes

1 me to Data Request 18, which is a good segue, regarding
2 the ownership of the non-BLM portions of project lands.
3 And, you know, you stated that you are going to finalize
4 the purchase or lease of the private property prior to
5 the issuance of a final decision on this application.

6 We are probably going to -- I mean, I know
7 that this is something you're working on. Could you keep
8 us updated to the greatest extent that you can as far as
9 the timing?

10 MR. HARPER: Yes, we will do that.

11 MS. VAHIDI: Okay, great. And regarding the Data
12 Request number 19, this again is sort of a site control
13 issue. The parcel merger question, and I know you are
14 talking about, you know, you're trying to see if you're
15 going to lease the lands or purchase them. And,
16 obviously, if you are leasing them, it's going to be
17 difficult to merge them.

18 So, again, this goes to the issue of the
19 Subdivision Map Act compliance and trying to make sure
20 that there is a legal parcel. And I just want to let you
21 know that what has come up on recent projects, and I
22 think that you kind of alluded to this in the response,
23 if you keep the parcels separate, there are restrictions
24 to develop -- there could potentially be restrictions to
25 development on those parcels depending on setback

1 requirements, and so on and so forth.

2 In other words, if you have multiple parcels,
3 each parcel will have its own setbacks, and you can't
4 develop on top of those setbacks. So I want to give you
5 the heads up on that because the Commission is going to
6 want an answer on legal parcel status. So something you
7 may want to think about, and I don't know if you want to
8 see if there's a way to tie the lots together or look
9 into that because it's definitely going to have to be
10 looked at.

11 MR. HARPER: Yeah. We will definitely take your
12 advice on that and look for resolution.

13 MS. VAHIDI: And I'm just giving you the heads up
14 because you don't want to get to the FSA stage and, you
15 know, have it hold it up, you know.

16 MR. HARPER: Definitely.

17 MS. VAHIDI: And I think -- oh, I think that's
18 pretty much it. Yeah, I'm okay with the responses to the
19 ag line questions, so I they we are clear on that. And I
20 guess that's it. And I don't know, Christopher, do you
21 want me to stay on for the issue resolution discussion?

22 MR. MEYER: If you could hold on for a little bit
23 that would be great.

24 MS. VAHIDI: Sure.

25 MR. MEYER: Any questions from the parties on the

1 land use?

2 MR. FOLEY: I just have one question. The
3 private lots which the project will surround, I
4 understand why they are not presently part of the project
5 description. But I have a question, will there be any
6 grant of easements or other licenses to those properties
7 as part of this project?

8 MS. VAHIDI: Do you want me to answer that or the
9 Applicant?

10 MR. FOLEY: Anyone is fine.

11 MR. EGAN: I'll answer it. It's not possible to
12 land lock someone so there will have to be access for
13 that. If we don't acquire the parcel we will have to get
14 them access out, so it will be set up so that they can
15 leave the parcel, obviously.

16 MR. FOLEY: So those parcels will be part of the
17 project in the sense that part of your project
18 description will involve some kind of conveyance of
19 easement or like rights?

20 MR. EGAN: If we don't acquire the parcel in the
21 long term.

22 MR. FOLEY: But these are the two parcels in the
23 map of the project plan that are designated -- not
24 usually designated NAP, not a part of the project?

25 MR. EGAN: That's correct.

1 MR. FOLEY: But you are still making efforts to
2 acquire those lands? I guess I misunderstood your
3 response to the question previously, and I thought you
4 were referring to other private lands within the project
5 boundary.

6 MR. EGAN: There is actually more than one owner
7 of the larger parcel. There are several owners of the
8 larger parcel.

9 MR. FOLEY: I see.

10 MR. HARPER: That's why I said the multiple
11 owners of that. Jim, did you want to talk a little about
12 the access and what you have to do for BLM?

13 MR. STOBAUGH: Well, there's going to be the
14 legal access to the parcels. So if they don't already
15 have them, it will be part of the equation we have to
16 take into consideration.

17 MR. FOLEY: And I guess the other question I had
18 pertains to not these two parcels but the other private
19 parcels within the project boundary. Am I correct in
20 assuming that you at least have an option on some of
21 these properties at present or not?

22 MS. LEIBA: Right now we are working toward site
23 control, and we will have to get back to you on the
24 specifics with each parcel.

25 MR. HARPER: Yeah. We will take a look at that

1 because we are in the middle of several, you know, trying
2 to work through that with the private landowners. But we
3 can try and get you that information.

4 MR. FOLEY: Just very general. I don't need
5 specific parcels but just to know where you are in the
6 process of obtaining site control.

7 MR. HARPER: Right.

8 MR. MEYER: Okay. If that closes out our
9 questions on -- from the parties on land use, that takes
10 us through the major issues on waste, unless I have
11 anyone on the phone. I'm not aware of any questions on
12 the responses we have received from the Applicant.

13 Jim, do you know of any questions from your
14 staff.

15 MR. STOBAUGH: (Shakes head.)

16 MR. MEYER: Okay. So that takes us through the
17 responses, the 52 responses to the data -- Set One, Part
18 One of our Data Requests that the Energy Commission staff
19 and BLM have put together.

20 What we have also done is there are a few
21 areas, such as air quality and culture resource, due to
22 their complexity and timing, they were set out as a
23 separate -- as Data Request Set One, Part Two. And at
24 this point we haven't had responses to those yet, but we
25 do have staff here to talk about it and to help clarify

1 any questions.

2 So I want to open this up now to air quality.
3 And I have Bill Walters here from Energy Commission staff
4 to answer -- ask any questions or see if we can get any
5 clarification on the questions the Applicant may have on
6 the requests that were sent out.

7 Why don't you come up and sit at the desk and
8 that way you can keep the podium open for anyone from the
9 staff from the Applicant. And just to let people know,
10 it's like generally these workshops we really focus on
11 the data requests and data responses. In this instance,
12 we've split up the process and they haven't had a chance
13 to respond yet. We are just trying to use this
14 opportunity where we have people to clarify what exactly
15 staff, both BLM and Energy Commission, are looking for to
16 make sure that when we get those responses in, they're as
17 clear and complete as possible.

18 MR. HARPER: Yes, and if I could just make a
19 comment. Right now we are trying to prepare these
20 responses, and so we are going to be requesting more time
21 to do that, just so that's understood. Thanks.

22 MR. MEYER: Yes. Probably the most useful thing
23 is to ask if the Applicant has any questions on the Data
24 Requests that they received?

25 MS. MITCHELL: We have had a chance to look

1 through the Data Requests. We have actually had a chance
2 to have a quick phone call with Will Walters and some
3 other CEC staff to try at least to get a handle on the
4 general direction that the questions were going.

5 And I think that with regards to any very
6 specific questions, not at this present moment do we have
7 really specific questions; but if you have any questions
8 that you want us to try to help answer, we can try to do
9 that.

10 MR. WALTERS: Well, since I don't have any
11 responses to go from, I guess one of the things I just
12 want to make clear in terms of what our questions and
13 what some of the directions some of these questions are,
14 in particular what we're looking for is to make sure that
15 we understand all of the mitigations to be proposed, in
16 particular for operations.

17 We understand that there may be some
18 revisions to some of the definitions or requirements for
19 some of the maintenance actions, as well as the emission
20 calculations for those. And we want to make sure that
21 those are clear. And then after those are done with the
22 remaining emissions, or at least the mitigation that you
23 are proposing that goes along with the creation of those
24 emission numbers, to make sure all that information is
25 very clear on what is being proposed by the Applicant to

1 reduce those maintenance operating emissions.

2 Obviously, when we first looked at it, you
3 know, we looked at the numbers and we were looking at
4 what we thought was a power plant in terms of the
5 magnitude. So, obviously, some of the emission factors,
6 the current emission factors, don't take into account
7 certain things like the use of higher tier engines for
8 diesel to knock down knocks, in particular, and some of
9 the other pollutants as well as some of the others things
10 that you might be able to take advantage of in terms of
11 mitigation that we would probably be imposing anyways.
12 Since for operation we are probably going to be looking
13 at conditions that would be very similar to what we have
14 for construction for vehicles; in fact, maybe even higher
15 for vehicles and for fugitive dust, probably similar
16 again to what we normally require for construction for
17 the life of the project.

18 So, you know, things like, you know, fugitive
19 dust plans or measures, essentially, what you are going
20 to propose to have those as clear as possible in the
21 responses so that we can go through, match the mitigation
22 to the Commission calculations and make sure that we feel
23 that everything lines up. And so when we start reviewing
24 it and making our decisions on whether additional
25 mitigation is required, that we start from a good solid

1 foundation.

2 MR. HARPER: Sure. Just if I could add, we
3 thought internally, because we've been looking at this at
4 SES and going back and working with our engineers on
5 this, and in going back and looking at it, we really
6 looked -- it seems like we were providing basically the
7 worst case scenario.

8 We've gone back and we started doing some
9 recalculations. And things that we're going to be doing
10 is, like, looking at the number of roads we have,
11 reducing some of our east-west roads, potentially looking
12 at the kind of vehicles that are being used at the site
13 and how we are staging vehicles, larger vehicles around
14 the site as well to, hopefully, cut down on the
15 maintenance trips back and forth between, like, a certain
16 area in the project.

17 And since it's such a large project area,
18 having some things actually stationed out in the site and
19 then minimizing the back and forth to the maintenance,
20 the main building complex. So with those kinds of things
21 we have already seen quite a bit of reduction just in the
22 number of vehicle trips and things like that, just in
23 considering that. So those are the kinds of things we
24 are working on right now and looking at a range of
25 vehicles as far as types of vehicles, what can we get by

1 with as far as are we going to stage things out in the
2 different quadrants of the site. You know, how can we
3 get people back and forth, things like that so.

4 MR. WALTERS: And some of our questions do relate
5 to the description of some of those activities. So
6 anything that would change with that description, in
7 fact, providing more description really in terms of what
8 maintenance activities are, how often they are required,
9 why they are required at the frequency they are required,
10 the exact actions that are required for them, so we
11 understand that, okay, this requires this type of
12 vehicle, a couple of personnel, and it takes this long to
13 do, and this is what they are going to get it done.

14 MR. HARPER: Yeah. We will make that a part of
15 our data response when we give it to you so we will give
16 you a full picture of what it is that it's going to take.

17 MR. WALTERS: And I would also suggest taking a
18 look at some of the things that are going to be proposed
19 on some of the other solar sites, both in terms of
20 construction equipment. Other things that I know we are
21 considering are issues like distributed water systems
22 that you may consider.

23 Obviously, the proposal is going to be yours
24 and we will have to look at it and consider whether we
25 think there may be other ways to reduce emissions even

1 further, depending on what and how well your mitigation
2 has knocked down emissions, at least from the original
3 proposal, which, you know, obviously from a knocks and
4 P-10 view are higher than what we would have initially
5 envisioned.

6 MR. HARPER: Right. The other thing is, too, is
7 that we have -- I believe the BLM also has some data on
8 recreation activities at the site, and those were part of
9 the some of data requests, I believe. I'm not sure what
10 numbers they are right now. But -- and we're going to be
11 providing that information, also.

12 MR. WALTERS: It's 53 and 54, basically, the
13 baseline site conditions.

14 MR. HARPER: Right, exactly.

15 MR. WALTERS: So, I mean, that's the major intent
16 of the things that we need so that we really understand
17 this type of project. Obviously, we have not evaluated
18 this type of project before. We are in the process of
19 evaluating other large solar projects, but this is a
20 little different, and the maintenance requirements are a
21 little different. We want to have a good understanding
22 of what they are and what the impacts are going to be.

23 And with that, Keith is on the line. I would
24 ask him if he might have any comments?

25 MR. MEYER: Just to let people know, Keith Golden

1 is the Air Quality Senior at the Energy Commission.

2 MR. GOLDEN: The only thing that I wanted to
3 perhaps mention here is the conformity issue with the BLM
4 and how that is all going to ultimately play out, whether
5 there has been any -- we brought this up, and I think
6 it's on some of our data requests. And I'm not really
7 sure how the structure in which the conformity aspect of
8 the air quality analysis is really going to be managed
9 either with BLM or with the Applicant and BLM and
10 ourselves.

11 MS. MITCHELL: With regards to the conformity
12 issue, I think after the re-analysis of the maintenance
13 vehicles, in not such a -- a kind of overestimation or
14 conservative estimation of actual movement and vehicles
15 needed, I think what we will see is that the emission
16 levels will drop to a point where it will be below the
17 threshold for a conformity analysis to be necessary. If
18 it is not, then a conformity analysis will be conducted.
19 But we have a feeling that once these are looked at in a
20 little more detail that will be an unnecessary step.

21 MR. GOLDEN: Okay. All right. I don't think I
22 have anything else. I think Will kind of pretty much
23 touched on the issues I think we were discussing about
24 the emissions. Was there anything as it related to the
25 delivery of the equipment, all the equipment that's going

1 to have to be delivered on the site that perhaps the
2 Applicant could elaborate or at this juncture are we just
3 going to wait for the data responses?

4 MR. HARPER: I can tell you, again, just what our
5 internal conversations have been in trying to look at
6 this. And, you know, the things that we are considering
7 now are looking at potentially with rail, for instance,
8 seeing if that's a viable way to actually bring equipment
9 into the site.

10 So, you know, we're right now just in the
11 middle of our discussions and we hope to close these out
12 soon so that we can get these data responses back to you
13 for full review.

14 MR. GOLDEN: That's great. We noticed there was
15 that rail spur out there, and we were thinking is that a
16 possible access point for delivery of lots of materials
17 via rail instead.

18 MR. HARPER: Right. Like, you know, for moving
19 staff around the site, for instance, we're looking at
20 using alternative fuel vehicles, looking at electric
21 vehicles and things like that.

22 MR. GOLDEN: Okay, good. All right. I don't
23 think I have anything else. We'll just await your
24 responses and then we will go from there, I guess. Will,
25 have you got anything else to add?

1 MR. WALTERS: Well, I have actually one more
2 question, just sort of a wrap-up question. When should
3 we expect to get the data responses or might we get the
4 data responses in batches?

5 MR. HARPER: No. It will come as one set of
6 responses. And we're looking at some point in late
7 January, sometime in February right now, first quarter of
8 2009, to wrap up the responses and get those back to
9 CEC/BLM.

10 MR. MEYER: And would that be air quality and
11 cultural resources?

12 MR. HARPER: Yes, it will be both.

13 MR. MEYER: Okay, thank you. While we're on air
14 quality, any questions from other parties?

15 MR. FOLEY: No.

16 MR. MEYER: Okay, thank you very much. I think
17 we will jump on to cultural resources. We have Mike
18 McGuirt with the Energy Commission. Carey, did you want
19 to join us? And just like the situation for air quality,
20 staff has not seen the data responses yet, and as you
21 just heard, we will be getting them a little later. But
22 this is just a chance for people to clarify exactly what
23 we need and if you guys have any questions on what we are
24 asking for.

25 Do you want to start off if you can clarify

1 any questions you might have?

2 MR. MUTAW: I think for the most part we are
3 pretty clear on your requests, and we have a good idea
4 where we are going to take the responses. I want to be
5 clear on 111 and 112, though. They are kind of either/or
6 is the way I'm reading them. If we are able to provide
7 the response for the request for additional
8 geo-archeological information based on extent data,
9 that's 111, then we would not need to go forward with 112
10 where we would have to commission a geo-archeological
11 kind of study specific to the project area.

12 MR. McGUIRT: Yeah, basically, we didn't want to
13 come across as saying right off the bat that we wanted
14 you to go out and do a geo-archeological field study. If
15 you have access to existing literature that provides you
16 that information that allows you to do the reconstruction
17 of the historical geomorphology of the project site and
18 make good arguments for why you believe it happened like
19 it happened and that allows you to construct good
20 physical context for the archeology there out there on
21 the project area, then there is no need for you to go do
22 field studies.

23 In the absence of that kind of information,
24 you know, we would like for the Applicant to consider
25 going out and doing the field work to acquire the data to

1 put together, you know, the basic physical context of the
2 project area.

3 MR. MUTAW: Okay.

4 MR. MEYER: Any other questions?

5 MR. GLENN: No. Actually, I think we've had some
6 good discussions so far, and we are on line.

7 MR. McGUIRT: Just for the public's information,
8 we have approximately 317 cultural resources in the
9 project area that we're trying to figure out how to
10 dispose of between the BLM, the Energy Commission, and
11 our Applicant. We have 254 archeological sites, 58
12 linear resources, most of which include prehistoric
13 trails of one kind or another, and then five what we call
14 built environment resources, which are buildings,
15 structures, infrastructures, and things like that.

16 We submitted our Data Requests to the
17 Applicant on the 2nd of December so they have had a
18 little over two weeks to look at them. And we had a
19 teleconference last week to help to clarify what were
20 pretty lengthy data requests that we had of the
21 Applicant. And so we wanted to be here today to see if
22 in the interim you have had any more questions that came
23 up and then we have a couple of comments we would like to
24 make as well to further clarify some of the things we had
25 said. Is there anything else you guys want to ask?

1 MR. GLENN: Not at this time.

2 MR. McGUIRT: Okay. So you all are working on
3 responses to our data requests. And part of that
4 response could involve, as is written in our Data
5 Request, revisiting some of the sites to gather more
6 inventory level data. We discussed that in our
7 teleconference. Provisions will also need to be made to
8 evaluate the historical significance of cultural
9 resources the project will impact. And one of the
10 questions we've been talking about is the schedule for
11 that.

12 Ultimately, of course, data recovery will be
13 necessary for those sites that the project will end up
14 destroying. Data Request number 127 explicitly asks for
15 Stirling to propose an evaluation schedule. What we were
16 interested in was whether SES or not has had the
17 opportunity to determine whether, and if so, when the
18 corporation might revisit some of the arch sites to
19 gather the additional inventory phase data. And, also,
20 have you all had the opportunity to start fleshing out
21 what you would like to see the timing be for the
22 evaluation of the historical significance of the
23 properties?

24 And where this is leading, ultimately, of
25 course, is there is a lot of work to be done on these

1 sites. And then the question is, when -- how are we
2 going to time that and how do you want to see that unfold
3 in the process. So we are very interested in talking
4 about schedule with you all and starting now instead of
5 waiting until a later date further down the road to have
6 that discussion.

7 MR. HARPER: Sure. Same here. We want to make
8 sure that we work as closely as we can with the CEC and
9 the BLM on this because we know how concerned the
10 agencies are about the schedule and just that workload.
11 I mean, it's an incredible workload beyond just what
12 we're doing for CEQA and NEPA. So, yeah, we'll be
13 diligent in that. And right now we are right in the
14 middle of the responses.

15 If we determine things sooner than later, we
16 will definitely get back to the agencies as far as if we
17 need to go back out and collect more field data. If it
18 looks like we're not going to have the literature, for
19 instance, for the geo-archeological study, we will
20 definitely get back to the agencies, of course, and the
21 let them know that as soon we find that out and really
22 try to maintain that relationship that I think we have
23 had so far in the process.

24 MR. McGUIRT: I agree. We have been talking more
25 or less informally about tiering our evaluations of the

1 historical sites and doing it on the basis of being able
2 to group sites and to site types, looking at districts,
3 looking at sites that won't fit into any groups or any
4 districts that we will have to do individually.

5 One of the things that we would really like
6 the Applicant to consider is, do they also want to tier
7 the timing of that. Do they want to evaluate different
8 parts of that at different times so that it might benefit
9 both the Applicant and the Agency in getting that done at
10 the critical junctures so that we are not hung up later
11 down the road on that? And so we are looking, and we are
12 hoping that the Applicant will begin to flesh out timing
13 versus, you know, in the AFC process that we have and the
14 NEPA process with the BLM, the joint process, your
15 construction schedule, how you would like to see this
16 unfold so we can start working out the nuts and bolts of
17 how we're going to do that now.

18 MR. HARPER: Right. And I think it was Soil and
19 Water Resources when we were talking about that. Someone
20 had requested possibly if we have some draft documents or
21 whatever. And I think that's what we will do is, you
22 know, if we can provide something in draft form so that
23 we can kind of make sure we're staying on the right road
24 as we're moving through this, we'll do that if that is
25 something you wish. I think that would help.

1 MR. McGUIRT: I think that would be helpful.
2 Because as I mentioned, there may be a little work to do
3 on inventory phase stuff, you have evaluation phase
4 stuff, and this schedule that I'm talking about is
5 ultimately probably going to wind its way into the
6 agreement documents that are going to be involved for
7 this down the road. So it would be helpful to start
8 working on that now amongst ourselves. A draft of
9 something like that I think would be very helpful.

10 MR. HARPER: Definitely. And include the
11 schedule, too. We understand the urgency of the agencies
12 on this.

13 MR. McGUIRT: Okay, great. Thank you. And in
14 the teleconference we had last week, we came to
15 understand that some of the prehistoric trails on the
16 project site were identified using remote sensing and
17 that a limited spot check by the Applicant has disproven
18 some of those as trails. They look like it from the sky,
19 but you got down on the ground and it didn't look like
20 that.

21 The BLM and the CEC would like to have
22 further trail verifications worked into our process.
23 Does Stirling plan to do that?

24 MR. HARP: If that's something that the agencies
25 request, definitely.

1 MR. McGUIRT: Basically we don't want to come
2 across as looking silly by saying things are a bunch of
3 trails that actually are not. So if we can verify --

4 MR. GLENN: That is our intent as well.

5 MR. McGUIRT: Great. Okay. There has been some
6 work that has recently been done out in the field to
7 check the correspondence between some of the
8 archeological site records and the DPR-523 forms and the
9 site descriptions in the technical reports.

10 As you all are aware, there are a number of
11 discrepancies between the two data sets. As part of the
12 Applicant's response to Data Request 117, the BLM and the
13 CEC would like Stirling to ensure that the revised site
14 descriptions are fully reflected on the site forms so
15 that you can go back and forth between the two.
16 Otherwise, it looks like we don't have it all together.

17 MR. GLENN: Absolutely.

18 MR. McGUIRT: So we would like to see that.
19 Okay. Also, I misspoke a second ago. The last item I
20 had is that there have been some site checks done on a
21 small sample of the archeological sites to see that what
22 is in the site descriptions and on the site records is
23 bearing out on the ground. And the preliminary results
24 indicate that in some cases, and I'm not saying that it's
25 terrible or anything, but in some cases we found that

1 there are artifact classes that are presented on the
2 forms for archeological sites that aren't showing up on
3 the ground and vice versa. So we are concerned about
4 correcting for that error.

5 And we realize that the time constraints and
6 all that this has been done under and the rapidity with
7 which it had to be done. What we asking is as part of
8 the further inventory phase field work that we mentioned
9 in the Data Request that may be necessary, or in the
10 evaluation field work, or maybe as part of any spot
11 checking that's done to verify trail locations, the BLM
12 and the CEC would like to roll a revisit to a sample of
13 the archeological sites out in the project area into this
14 future field work to attempt to verify and to correct
15 for, to provide us some kind of data as a correction for
16 these inconsistencies that we're finding on some of these
17 forms and to make everybody feel comfortable that what
18 we've got is what's out there and to establish a range of
19 error.

20 MR. HARPER: Is that something we can consider
21 and have further discussions on because I know right now
22 we are going through a lot of revisions with site
23 records. And if some of those are taking care of those
24 concerns through that process, then we can, working with
25 you on that closely, convince you of that then, is that

1 something where we can look at maybe, you know, if we
2 don't need to go back out and verify we can do that or --

3 MR. McGUIRT: As we see, there is a possibility
4 for different phases of field work. You've got maybe
5 some redo of some inventory stuff, you've got evaluation
6 stuff, you've got trail verification, and we don't know
7 yet, maybe geo-archeological field studies. So we're all
8 into efficiency. The more there are things you can ball
9 up into one effort, the better. We certainly don't want
10 you guys to go out and spend a bunch of money on a bunch
11 of separate efforts. We will be happy to work with you
12 to pull that all together.

13 MR. HARP: Yeah. And maybe what we can do, also,
14 is provide you with kind of a progress or an update since
15 there is going to be one or two months here before we get
16 the responses back. And then we can have, you know, at
17 least the resource specialists or whatever work very
18 closely with you guys to make sure that you understand
19 where they're at and what our thoughts are.

20 MR. McGUIRT: Great. That's all I have. It's
21 been a good working relationship. We're moving forward,
22 and we're making progress, and I appreciate the
23 Applicant's efforts. And I'm sure the BLM does as well.
24 Anything else I can answer?

25 MR. MUTAW: No, thank you, Mike. I feel the same

1 way. It's been a great working relationship with you and
2 the BLM. We're doing the right thing here.

3 MR. McGUIRT: Good deal. Thank you.

4 MR. MEYER: Great. Thank you all. I appreciate
5 it. Cultural resources has been a huge issue on this
6 project and created a lot of issues to work out. And I
7 appreciate everyone working together to try to resolve
8 these and keep moving forward, both on the Applicant and
9 Energy Commission, especially the BLM. We appreciate it.
10 Any parties have any questions on cultural resources?
11 Okay, excellent.

12 At this point this is, really, this has taken
13 up the Data Request/Data Response portion of the
14 Workshop. And this is sort of a dual Workshop for -- at
15 least in the Energy Commission process where we look at
16 both the questions we had and the responses and any
17 clarification, but also this is an opportunity for the
18 Applicant to address any of the concerns we raised in our
19 Issues Identification Report or even just open it up to
20 more general questions that we may not have covered.

21 So at this point I'm just going to let the
22 Applicant, if they have any issues that they want to
23 raise as far as, you know, their address of either the
24 Issues Identification Report or general issues that have
25 come up so far.

1 MR. HARPER: I just wanted to kind of go back
2 over. In, you know, my experience in working with BLM
3 and other Federal agencies, just wanting to make sure
4 that, you know, as the Applicant, our communication with
5 you is on target, that if there is anything that -- any
6 of the resource specialists as we're going through these
7 different smaller planning efforts, like the
8 decommissioning plan, things like that, if there is any
9 guidance or things or table of contents that either the
10 BLM or the CEC would like to see in those plans, because
11 I know there's --

12 (Brief interruption because of speaker phone
13 recording.)

14 MR. HARPER: But again just to --

15 MR. MEYER: Apparently that's not my phone. If
16 those on the phone could check their machines or someone
17 who walked away --

18 (Further speaker phone interruption.)

19 MR. MEYER: Well, we will mute them for a moment.
20 I think we are done with that call. So, okay.

21 MR. HARPER: But mainly in just knowing that we
22 are right now going through this process, for instance,
23 with the solar thermal power plant, P-O-D guidance,
24 anything like, anything that we know of that's kind of in
25 a draft format that we think, you know, from the agencies

1 that would be good to share as new policy is shaped, or
2 whatever, just that so we are providing the fullest that
3 we can the information back to the agencies and maybe
4 that will help as we move forward in developing these
5 plans, looking at the PSA and the EIS and ensuring that
6 we have met both agencies' needs for information in
7 preparing that document. But anything like that that
8 you could do for us as the Applicant would be appreciated
9 so.

10 MR. EGAN: I would just like to say thanks from
11 SES. I think this relationship and hard work for all
12 parties here has been fairly incredible. And we are all
13 breaking new ground here. This project type has never
14 been really done before of this magnitude particularly.
15 So, if you notice even by the size of the application,
16 there has been maybe none in the history of the CEC that
17 has been as large. And, again, we at SES would like to
18 think CEC/BLM for their help and cooperation on this. We
19 appreciate the way this is going forward.

20 MR. MEYER: Same here. My chiropractor is not
21 very happy with your application.

22 (Laughter.)

23 MR. MEYER: So, one thing just to put out there
24 to the people that are members of the public that are
25 going to be involved in this case as we go through, Jim

1 and I have talked a lot about this in the past as far as
2 public participation in trying to encourage it usually as
3 much as possible early in the process so that as we are
4 preparing our preliminary documents we have as clear a
5 picture of what the concerns the public may have on the
6 various areas because, as you have seen in the work that
7 we have done so far today in front of you, these are just
8 a few of the technical areas.

9 We basically will break the analysis into
10 about 22 areas, and I will have different technical staff
11 working on those, everywhere from air quality here, we
12 have visual, traffic, land use, a lot of different areas
13 that will look at both environmental and engineering
14 aspects of the application that's in front of us.

15 And, you know, in trying to sort of flesh out
16 what the potential problems are, a big portion of what
17 can be helpful is if people are here on the ground in the
18 field in the area, you know of an issue of a concern or
19 potential something you see in the application or one of
20 our preliminary documents that you don't think is
21 correct, and you think we should double check it, letting
22 us know early is very helpful.

23 And letting us know in writing, you know, we
24 have a lot of information out there, like my e-mail
25 address. Jim's e-mail. You can mail things to me if you

1 would prefer. Getting something in writing is the
2 absolute best way for us to make sure that I can transfer
3 that to, you know, the Energy Commission staff, to BLM
4 staff, to the Applicant, to whoever we need to, to make
5 sure that they get that answer or get that issue
6 addressed as clearly as possible, so I'm not trying to
7 re-interpret what your concerns are to put it into
8 writing for someone else.

9 So that's something we always say, give us
10 your comments as early as possible so that we can make
11 sure that we carry those through the entire process and
12 we are not trying to address an issue at the very end.
13 And that's just sort of a general question or general
14 comment I have.

15 One thing that, as you may have heard, air
16 quality we have talked about as being one of the concerns
17 we have an issue on this project. It wasn't identified
18 in our Issues Identification Report because it was
19 something that when we started looking a little closer
20 into the project we had some questions which resulted in
21 the Data Request that the applicant is working on right
22 now. And operational air impact was one of them.

23 And I'll sort of open it up to the Applicant
24 as far as, you know, what thoughts you have may have on
25 ways to reduce operational air quality impacts from the

1 mirror washing, mainly the trucks.

2 MR. HARPER: One thing -- And it gets back to
3 some earlier comments. One thing that we have been
4 looking at is just how we stage vehicles around the site,
5 especially larger vehicles that may be like larger tanker
6 vehicles for holding water, then what you would have is
7 instead of the way we've described in the EMC is
8 basically everybody kind of going out in the morning
9 first thing, packing their vehicle up, going out to the
10 work site and working out there with all the different
11 equipment that they need and then basically packing
12 everything up at the end of the day and coming back into
13 the main complex there.

14 And when we realized what we had done, I
15 mean, basically we had created the worst case scenario as
16 far as how the operations would occur on our project.
17 And it only came up when we looked at the data request
18 that it came to us that we really had that insight. And
19 so what we are doing now is going through some different
20 meetings internally again with our consultants, with both
21 URS and Stantec, and looking at a strategy that will
22 provide in our responses that will really cut those
23 number of trips down, for instance.

24 Just to give you a scenario of what we are
25 looking at is that we would basically work in quadrants

1 around the site, especially with the mirror washing. And
2 from that, you would have all your larger vehicles staged
3 out there in that quadrant, and then you would have
4 smaller vehicles that would service from those larger
5 vehicles within that quadrant, as well as far as like the
6 smaller vehicles that would go up and wash the dish for
7 each of the Sun Catchers.

8 Now, at the end of the day or at the
9 beginning of the day and the end of the day, going out to
10 that work site or that quadrant, we are looking at using
11 electric vehicles to actually get work staff out to those
12 locations, again trying to cut down in our emissions and
13 also in our traffic miles going back and forth across the
14 site.

15 A further detail as I mentioned earlier is
16 also looking at just the number of east-west roads that
17 we have. Again, when we first designed the project what
18 we were looking at for the AFC and in describing that
19 750-megawatt alternative, you have in there excess roads.
20 Going back and looking at it, we don't need all the
21 east-west roads. In fact, having all those east-west
22 roads and looking at it again since we received the data
23 request, you can see where people would start doing
24 diagonals almost across the site, and it just adds
25 traffic miles.

1 You know, you forget your wrench so you go
2 back into the main complex or whatever to get your wrench
3 or whatever. So there's just efficiencies in looking at
4 how we can stage our work equipment around the site in
5 different areas and then basically just transport people
6 out to the work area each day that cuts down on a lot of
7 miles. We have already seen that in just preliminary
8 studies looking at it in our meetings.

9 And that's pretty much the vein of it. We're
10 going to continue doing that, looking at the different
11 processes that we have for maintenance and seeing how we
12 can come up with those efficiencies.

13 MR. MEYER: Thank you.

14 MR. STOBAUGH: I'd just like to say, this has
15 been part of a learning experiment for us as well. This
16 is -- it's my first and I believe it is for the Field
17 Office as well venturing with the California Energy
18 Commission's processes and we're merged with the Bureau
19 of Land Management processing as well. So we haven't,
20 you know, this is a first experience with it. And I
21 think that it's one where you do see how the intent
22 behind the Memorandum of Understanding that the CEC and
23 BLM entered into was to try to avoid duplication, try to
24 find efficiencies in both of our processes, share our
25 expertise.

1 I mean, this has been largely, for I know for
2 the BLM folks, this has been a learning and listening
3 about the way the CEC may be looking at some of these
4 issues as well and realizing there is a lot of parallel
5 from not only the National Environmental Policy Act,
6 which are our requirements, but the California
7 Environmental Quality Act as well as the meaning as far
8 as here in California.

9 So I think it's -- I think it's going be a
10 very positive experience that we both learn how to do.
11 And I think there is going to be many others, so I
12 commend you guys for being the guinea pigs. I think you
13 brought this all together. And, I mean, you have the
14 Federal, you have you the State, and look here we are in
15 the County facility right here so you can see all three
16 levels of government at work trying to get this thing to
17 walk down the processes, if you would, in as much of a
18 succinct manner as we can. So thank you.

19 MR. MEYER: Do you have any comments on this?

20 MR. FOLEY: I look forward to working with
21 everyone further. And, obviously, it's an innovative and
22 interesting project. It's probably -- I don't know this
23 for a fact -- but at ten square miles it's probably the
24 largest proposed project in the country right now. So
25 it's a learning process for everyone.

1 MR. EGAN: It's actually the largest solar
2 project on the books in the world.

3 MR. FOLEY: I mean projects period, solar,
4 non-solar.

5 MR. EGAN: Using land area, yeah.

6 MR. FOLEY: Project area, yeah.

7 MR. MEYER: Thank you. Okay. At this point we
8 are going to have more from BLM, and I'll let Jim take
9 the lead on our second phase when we have the BLM scoping
10 meeting portion of this, and that will be from 5:00 to
11 7:00.

12 And to start that off here we will give you a
13 little bit of background on the project and they'll give
14 a couple of presentations just to refamiliarize people or
15 give people an idea who didn't make the first
16 informational hearing. But, although that will be really
17 focused on giving the public a chance to speak generally
18 about the project, since we have a little bit of extra
19 time at this point, I would like, if there are any
20 members of the public who would like to get up, if you
21 have any questions on issues we have been talking about
22 now, this would be a good time to ask them while we have
23 staff available to answer your questions.

24 MS. HARMON: Edie Harmon. And I have been
25 listening. I want you to know it took me over four hours

1 to download the response to the data requests, which is
2 really --

3 MR. MEYER: I'm going get you a CD with some of
4 the information. I will talk to you and I will get your
5 address and just make sure we send you a CD.

6 MS. HARMON: Because I really did want to read
7 it. But I have some questions that came up in response
8 to things I heard today. And one question is, why would
9 you want to store a year's worth of water on-site and the
10 amount of surface area is really important because in
11 this area the pan evaporation is a hundred inches a year
12 from surface. And that translates to eight or nine feet
13 -- you know, acre feet if you had just an acre.

14 So the question now is that the storage area
15 and the depth is critically important. And if what you
16 don't want is a lot of mineralization when you're going
17 to be washing your mirrors, I don't understand why you
18 would be wanting to store a year's worth of water
19 on-site. But the fact that you didn't come close to
20 describing the amount, the size when you were looking at
21 33 acre feet --

22 MR. MEYER: I think there might be a
23 misunderstanding as far as what the intent of what that
24 water storage is. And I'll let the Applicant jump into
25 that. I think that they will be able to clarify that,

1 the difference between water storage for use in washing
2 the mirrors and, you know, a waste water stream.

3 MR. ARAUJO: My name again is Ned Araujo. I'm
4 with Stantec. I'm a civil engineer. The confusion may
5 be from the different parameters. We have 33 acre feet
6 so the water needs for the project would basically be on
7 a continuous phase. In other words, the water would be
8 constantly coming in. And the acre that we are talking
9 about is only for the waste products from the water
10 treatment process. In other words --

11 MS. HARMON: That was not clear.

12 MR. ARAUJO: Right. So to clarify, basically our
13 water is going to come in either from well or from canal
14 or whatever source it's coming in, it's going to be
15 treated to a level that is suitable for several
16 operations, for construction, for maintenance, for
17 washing the mirrors. Some of the water that's going be
18 processed to wash the mirrors may generate some backwater
19 or some water that would be basically diverted to the
20 evaporation ponds.

21 So the water that would go to the evaporation
22 ponds is very limited. It's just as a result of the
23 treatment of the water, not the overall project water.
24 The overall project water would not be stored.

25 MS. HARMON: Okay. And then I have a question.

1 When you just stated the water from wells or IID, the
2 water in that site, if you are looking at ground water
3 there, is extremely high in TDS. And I saw in the data
4 request forms the will-serve letters from IID that you
5 were looking to get construction water from IID, and
6 operational water from IID.

7 And this is extremely significant because the
8 only well water on the western side of the County is used
9 for the community of Ocotillo, and the water issues
10 related to well water is the subject of litigation
11 against the County of Imperial relating to the U.S.
12 Gypsum EIS/EIR and that is in court. So water issues are
13 extremely important and how well water is used -- potable
14 quality well water is used is a very big consideration.

15 MR. EGAN: That's an excellent question. Let me
16 answer that -- or help to answer that. And sorry for the
17 laryngitis. If we did use well water, it is not the
18 Ocotillo aquifer. There is a totally separate aquifer to
19 the east of your -- or the Octotillo aquifer, and that is
20 bad --

21 MS. HARMON: That's bad water.

22 MR. EGAN: It's somewhere between two and four
23 thousand TDS. If we did that, that would be part of the
24 treatment water that would end up in the pond that Ned
25 was walking about, but it would definitely not interfere

1 with the Ocotillo aquifer.

2 MR. STOBAUGH: For our note takers we'll have to
3 explain what TDS stands for.

4 MR. EGAN: The term TDS is total dissolved solids
5 and it's typically looked at as salt in the water or the
6 minerals that exist in the water.

7 MS. HARMON: And the water in that area I have
8 seen TDS levels in some of the wells is up to 15,000
9 parts per million. If you are going have waste water
10 stored there and it's going to be high TDS, the quality
11 of that water could be extremely important for migratory
12 birds and wildlife. So there are grave concerns about
13 the surface area that is going to be exposed and what
14 sort of sort wildlife would be.

15 And my understanding from BLM in terms of
16 looking at standing water and standing gravel pits, that
17 they don't want anything that birds could be landing on.
18 So it's going to be important to make sure that this does
19 not become an attraction for wildlife. And if it's got
20 increasing TDS or whatever the mineral concentration
21 might be, you don't want to end up with bird die-offs.

22 MR. MEYER: Our biological staff is working with
23 the BLM's biological staff to address that, and that's
24 one of the reasons we had some of the questions about the
25 side slopes to discourage shore birds. But that's

1 something we're going to be looking at from a lot of
2 different aspects, mainly from the biological to make
3 sure that it's --

4 MS. HARMON: I appreciated those concerns from
5 biologists. And then a question as to how the mirrors
6 will be washed and what happens -- how much water is
7 going to be used, on what frequency, and is that water
8 just going to run off the surface of the ground. And in
9 a letter that I saw from Public Works Department it
10 indicated that all the roads on the area would be paved.
11 And at one point I saw something that said 500 miles of
12 dirt roads. But if it's 500 miles of paved roads on-site
13 that is a tremendous amount of paving. And if you are
14 talking about decommissioning at the end you need to look
15 at what in the world is going to happen to 500 miles of
16 asphalt or whatever the pavement is, where is it going to
17 be deposited, and how it is going to be dealt with.

18 MR. ARAUJO: If I may address that. The paving
19 has been described as two different options. It could be
20 the traditional AC paving or it could be through the use
21 of soil binders, which would be a product that is inert
22 which is basically applied to the soil and not
23 necessarily be a product of asphalt.

24 MS. HARMON: But inert, if it's going to have
25 heavy traffic over it, it may -- portions of that may

1 eventually become airborne.

2 MR. HARPER: If I could -- actually, it's used
3 quite a bit by the Army Corps especially at military
4 bases, and it actually -- it holds up quite well. I
5 mean, they use this to land large transport planes on it
6 year after year, so I mean it is something that holds up
7 quite well.

8 That's not to say that you don't have to go
9 and reapply it at some point, just like you would have to
10 go in and repair an asphalt road. It's actually quite
11 durable.

12 MS. HARMON: And how are the mirrors going to be
13 washed and with what frequency?

14 MR. ARAUJO: Do you want me to address that
15 washing of the mirrors?

16 MR. HARPER: Sure.

17 MR. ARAUJO: The AFC currently has the washing as
18 described using 14 gallons of water per wash cycle. And
19 during the summer period all mirrors would be washed with
20 what is called a scrub wash that contains up to three
21 times that amount, so it would be 42 gallons of water.
22 And at this point we are not anticipating any runoff from
23 that washing. In other words, the amount of water that
24 is used is so little for each dish that we are not
25 anticipating water to basically accumulate underneath the

1 SunCatcher.

2 MS. HARMON: What frequency?

3 MR. ARAUJO: The frequency would be once a month
4 approximately. And overall in a year we are looking at
5 nine washes per year as described in the AFC.

6 MS. HARMON: You're optimistic given what I see
7 of the dust in the desert.

8 Going on to concerns about the archeological
9 sites. And some of this comes from having lived here for
10 more than 30 years and having gone out in the field with
11 a number of archeologists, both BLM archeologists and
12 archeologists with the Imperial Valley College or the
13 museum. And I realize that a lot of the -- you indicated
14 that there was a difference between what were considered
15 cultural resource materials that had been indicated -- so
16 indicated by BLM staff, or by probably the local
17 archeologists doing research for the Imperial Valley
18 College and the Desert Museum versus people that were
19 looking at this project. And I can tell you, I can go
20 out in the desert many times, and I can recognize now
21 things as cultural resources and trails that people with
22 me don't see unless I tell them.

23 And I realize that some of the trails will
24 disappear in the distance and you need to look at what's
25 off-site and not just on-site. And sometimes I can pick

1 up portions of things that are trails at a great
2 distance. Sometimes you can tell the distance a mile or
3 more away if you know what you are looking at and if you
4 follow the trails.

5 In some cases trails have been destroyed by
6 motorcycles or other vehicles. But I think when you are
7 looking at the cultural resources you need to consider
8 who is looking at them and is the staff people that are
9 familiar with the archeological and cultural resource
10 materials of this county and this type of desert or is it
11 people that are being brought in and coming in from
12 elsewhere.

13 Because I know on several sites we have
14 looked, and archeologists that are familiar with the area
15 have basically said the work that was done by consultants
16 was incorrect and unacceptable because they were not
17 familiar enough with the resource area. And on one
18 project the whole cultural resource evaluation had to be
19 redone. And one of the people that had criticized it
20 happened to be someone that has worked with one of the
21 co-authors on other papers and said he felt it very
22 difficult to stand up in public and say that one of his
23 colleagues had done a cultural resource evaluation which
24 was unacceptable because it was not, you know, didn't
25 really look that carefully.

1 So I would urge when you're saying that there
2 is a discrepancy between what BLM and the local people
3 think of as cultural resources, trails, or anything else,
4 that you really need to give a lot of deference to the
5 people that have spent a lot of time and work in the
6 area. And you really need to consider the views and
7 values of the Native Americans that are familiar with the
8 area.

9 And I think that we make a mistake if we
10 think that people that come in from the outside know
11 better what's here than the people who have spent
12 decades, you know, looking at the resources. And, again,
13 it's like even looking at an individual rock and being
14 able to tell whether something has had strikes or blows
15 and it's representative of a tool that's many thousands
16 of years old or whether it's just another rock. But it
17 depends upon how familiar you are with the area.

18 MR. MEYER: And I can answer that a little bit as
19 both the project manager and an archeologist. You know,
20 I have worked on sites, you know, all over. I have done,
21 you know, been working around sites in this area on some
22 projects as oversight. But I recognize that my specialty
23 is as coastal an island archeologist, so one of the
24 reasons that the MOU between the Energy Commission and
25 the BLM really puts a lot of the authority, sort of the

1 final call on the archeology in the BLM's hands, is that
2 we recognize they have district offices and field offices
3 all around the areas in California where these projects
4 may be proposed.

5 And our idea on that is to rely on the
6 archeologists who their career is in protecting the
7 resources of the area that these various projects are in.
8 So we have an invaluable resource in the archeologists
9 for the BLM that work here.

10 And also one thing that our staff and the BLM
11 staff look at is the resume, sort of the curriculum vitae
12 of the archeologist from the Applicant and where their
13 specialties are. And we recognize that, you know,
14 someone may be a premier Peruvian archeologist but we
15 really want someone who understands the very unique
16 situation of desert archeology and how sites are formed
17 and eroded and what to look for. So that's something we
18 are very cognizant of. And any time we have any sort of
19 discrepancy between the parties, we are going to run that
20 down and not just leave it as an open issue. So that's
21 something we will be looking at.

22 And we also, to answer the issue on the
23 Native American process, both the Energy Commission and
24 the BLM have very explicit directions and procedures to
25 make sure that the Native American issues are addressed

1 and that they have a full opportunity to express their
2 concerns to us so that we can evaluate that throughout
3 the process.

4 MS. HARMON: I would just encourage that maybe
5 BLM be a little more careful than you were on the Glamis
6 Imperial Mine Project because that was one that had to go
7 back for cultural resources, and ultimately BLM denied
8 the mine project. It was the first time anywhere in the
9 nation that a mine project under the 1872 Mining Law was
10 denied and it was because of the significance of cultural
11 resources in the area and the visual resource impact
12 related to those cultural and historical resources. And
13 the first draft that came out of the project the cultural
14 resources review was not adequate.

15 So, you know, for whatever, you know, to get
16 the message across to BLM and the State, sometimes you
17 really need to double check and maybe you want to send
18 some of the comments out for review before you actually
19 put a draft document up into the public arena for public
20 comment just to be sure the same thing doesn't happen.

21 Because I was very much impressed with the
22 sincerity of Carmen Lucas at the last meeting and the
23 fact that she had been asked to come down from the State,
24 which indicates, I think, a tremendous concern of some
25 people about the significance of the cultural resources

1 in the area.

2 And, you know, there are some places that
3 just aren't right for a project. I just wanted to put
4 those concerns out because of what I heard this morning.

5 MR. HARPER: Before you sit down, just so you
6 know my background. I think we have more qualified
7 archeologists on this project than any other project.
8 Well, this is the largest project as far as a solar
9 thermal power plant. But I'm not sure any of the other
10 ones in the future will have as many archeologists
11 working on it. You know, you have Chris here, myself. I
12 have a Master's in Anthropology. Most of my career has
13 been archeology and doing ethnicity work for tribes. I'm
14 very respectful of Carmen's concerns, and we extended a
15 hand to her as far as just making sure that she fully
16 understands the technology that's going to be going on on
17 the ground.

18 We have also invited her out now, since I
19 came onto the project. There were some things that
20 needed to be corrected; I'm not saying that. But we are
21 diligent in our work with BLM and the CEC to make sure
22 that we respond to their requests for either further
23 investigation, revision of any of the sections of the
24 document, all of that. We are very diligent in making
25 sure that we meet what their requests are.

1 MS. HARMON: I just want to add, if this is the
2 project that has the most archeologists involved, maybe
3 it's the wrong site because if you need that many
4 specialists dealing with cultural resources, there are
5 probably a lot of places that could have been selected
6 where there would have been fewer impacts, like the
7 Mesquite Lake area of the central part of Imperial
8 County, which is a very large acreage which is already
9 zoned for industrial.

10 But in the 30 years I have been here there
11 hasn't been anything going on there and that area is
12 disturbed and wouldn't have the same kind of impact.

13 I want to get back on one thing that nobody
14 asked on the air quality issues. And I apologize, but my
15 recreational reading is pretty much epidemiology. And
16 one of the issues, and I raised this concern with U.S.
17 Gypsum, but it's far more significant with this project,
18 is you have a state prison with an involuntary population
19 of more than five thousand, which is more than double the
20 capacity. So it's crowding and stress and a lot of
21 people being brought in from urban areas, and it's only a
22 few miles to the northeast of the project site.

23 And one of the real concerns in state prisons
24 in California and that is a concern in Arizona now, is a
25 problem of coccidioides and coccidioidomycosis. It's a

1 fungus that lives in desert soil. It encapsulates and
2 survives very well during periods that are dry. It
3 becomes a real serious problem after you have a year of
4 growth situation with heavy rainfall and water.

5 . And in Arizona I think right now the number
6 of cases are over six thousand a year, and in some of the
7 state prisons it's a real serious problem. And I think
8 given the fact that exposure to dust, construction,
9 agriculture, and what not, is what puts people at risk,
10 especially if people are coming into the area from
11 outside and are not familiar. And those people that are
12 in archeology probably know, you've probably seen the
13 warnings that archeologists are at risk.

14 But I think you really need to evaluate the
15 kinds of soil disturbances on this kind of acreage and
16 what it means in terms of public health for people, the
17 involuntarily population of the state prisons that can't
18 go anywhere, but their health issues are a public concern
19 because it's the public that's paying for that and other
20 people.

21 So I just want to be sure because I didn't
22 see all the questions on your questions related to air
23 quality. I don't know whether that's one that's already
24 been raised or not.

25 MR. MEYER: Actually, we'll address that in

1 public health, and I will pass that concern on to our
2 public health specialist at the Energy Commission to make
3 sure that he takes a look at that issue.

4 MS. HARMON: And I've got some articles that I
5 can submit on concerns with the public health issue and
6 as an issue in the California state prisons.

7 MR. STOBAUGH: That would be good because, I
8 mean, spelling of some of these spores and what not; I
9 can't even pronounce them.

10 MS. LEIBA: Well, actually, this is Angela Leiba
11 again, and maybe Julie Mitchell could speak to this. We
12 did actually analyze this in our public health section,
13 and maybe Julie can give a quick recap.

14 MS. MITCHELL: Well, one of the things that we do
15 when we look at that, we understand that when you do
16 disturb the soil, a more common term for that is Valley
17 Fever, which is a little easier to pronounce for
18 everyone.

19 And the mitigation factors that go on with
20 the construction on the site, such as watering the soils
21 and watering while you're doing any soil disturbances,
22 knock down the dust that could potentially come off-site
23 significantly. And that's one of the best mitigation
24 factors for reducing any potential impact from Valley
25 Fever because it is essentially dust-born.

1 And so all the mitigation factors that go
2 along with the construction activities, primarily the
3 watering, will -- and reduction in any trips that you can
4 -- will reduce any possible impact.

5 MS. LEIBA: And, Julie, I know that you looked at
6 the prisons specifically.

7 MS. MITCHELL: Uh-huh. The prison was
8 specifically put in as one of our sensitive receptors to
9 ensure that no negative health risk impacts occur at that
10 particular location.

11 MS. LEIBA: So there aren't any?

12 MS. MITCHELL: From our -- the models that we ran
13 we did not predict any negative health impacts there.

14 MR. MEYER: And our staff will be addressing that
15 as well, and we'll, you know, look at their analysis and
16 we'll make any conclusions on that or any additional
17 questions that we need.

18 And, Ms. Harmon, I thank you for your
19 questions on that, and we will get that off to the
20 appropriate staff.

21 MS. HARMON: And I just want to add, the question
22 on coccidioides and coccidioidomycosis is from the first
23 EIR I ever read in Imperial County it was on a
24 transmission line, and it raised the very serious concern
25 of health impacts by putting the electrical transmission

1 line through the desert areas in this part of the county.
2 So the question was actually triggered by an EIR.

3 MS. EGAN: And, Edie, as you heard earlier, we
4 are going to get you a CD.

5 MR. MEYER: Thank you.

6 MS. TISDALE: Donna Tisdale. I'm actually a
7 resident of Boulevard, but I'm a property owner in
8 Imperial Valley, and I was raised down here. I haven't
9 had the opportunity to read through all this in depth,
10 but from what I'm hearing and from what I have seen
11 earlier, I'm concerned that there is some reliance on the
12 U.S. Gypsum EIR, especially in relation to air. And I
13 did -- while I heard references to we are going to look
14 at the U.S. Gypsum EIR, who was talking about that?

15 MS. LEIBA: I think there was a request in with
16 them -- they asked us if we had it so that we could
17 supply it to them, but we do your own analyses. We do
18 not use --

19 MS. TISDALE: Well, good. I want the CEC, then,
20 to understand that the U.S. Gypsum EIR, I was involved in
21 studying that. And I'll tell you what, that's a very
22 inadequate document, and I found quite a few things that
23 were wrong. I focused mostly on water issues there, and
24 we were able to turn that around. And in the litigation
25 they are now supposed to be using imported rock water

1 rather than the well water. But I'll tell you, when I
2 read the air quality, too, that was -- so many things
3 were left out.

4 And also in the traffic, they hadn't included
5 all the truck traffic from the sand mines, aggregate
6 mines that are out there. But you see the traffic is
7 incredible from the trucks. So I don't know if that has
8 been addressed or not.

9 And all the talk about all these people
10 involved in this, my personal opinion and my experience
11 is, there is a lot of political influence on government
12 employees, and so I do not rely on what they do. They
13 may have the best intentions and the best education, but
14 there's a lot of political influence and we're just as
15 subject to that.

16 And my little nonprofit group is getting
17 ready to sue the BLM over their Eastern San Diego
18 Resource Management Plan and their Downgrading and Visual
19 Resource Management classifications there. So there are
20 a lot of concerns from the public. Thank you.

21 MR. MEYER: Thank you very much. Any other
22 members of the public that would like to step toward?

23 MS. WEINER: Hello. My name is Teri Weiner. I'm
24 staff for the Desert Protective Council, which is a
25 nonprofit desert education and advocacy group. I'm the

1 Imperial County Conservation and Projects Coordinator. I
2 would like to receive a copy of this binder, which I
3 borrowed from the gal at the front desk. And I have been
4 reviewing it in between people's comments.

5 I'm interested in the area of the three
6 little paragraphs on power plant efficiency. I'd like to
7 understand how this works. You talk about each engine --
8 Stirling engine requiring -- there's thirty thousand
9 Stirling engines, and each one is going to require
10 certain amount of cubic feet of hydrogen gas, and there
11 will be storage for it with each engine. And that this
12 hydrogen gas will come from natural gas?

13 MR. MEYER: Well, actually, I'll let the
14 Applicant explain that from their engineering standpoint.

15 MR. ARAUJO: My name, again, is Ned Araujo. Each
16 engine will produce their own electricity. The gas is
17 used as a fluid to transfer the heat from the sun to the
18 cylinder of the engine, so the gas is not going to be
19 consumed. It's a transfer fluid, a transfer of gas that
20 is basically going to be used circulating within the
21 engine. Very little is going to be lost, so it's --

22 MS. WEINER: So I guess my question is, how much
23 -- is this amount of gas that's mentioned in here,
24 natural gas, would that be the total amount that would be
25 used or is this an annual requirement for natural gas?

1 MR. HARPER: It's not a natural gas.

2 MR. ARAUJO: The gas is regular hydrogen, and the
3 gas will be basically stored within the engine and on the
4 other tank for supplement.

5 MR. MEYER: Yeah, I think that I can actually get
6 to part of the question. That was actually in one -- my
7 efficiency expert who was on the phone was asking that
8 very same question. They said they'd have to get back to
9 us on whether the 24,000 therms was the amount of energy,
10 you know, natural gas that they have to put in to break
11 the hydrogen free.

12 MS. WEINER: Right. Right. That's --

13 MR. MEYER: We're still trying to find out if
14 it's in an annual operation, how long. So the Applicant
15 will have to get back to us on that with an answer.

16 MS. WEINER: So it's leading me to think that you
17 may have to transport some source of this fuel to the
18 project site, transport by pipeline or --

19 MR. ARAUJO: At this point we are considering
20 either having the gas produced on-site or transported to
21 the site, yes.

22 MS. WEINER: Okay, thank you. And I'm also
23 interested in the biological impacts. There's not very
24 much information in response with data requests on the
25 burrowing owl and the flat-tailed horned lizard. You

1 mentioned burrowing owls on the east side of the site and
2 probably some on the sides of the washes on the site and
3 that you will not disturb the site during their -- during
4 the first part of the year when they're nesting.

5 But your schedule, your timetable, mentions
6 that you are going to begin construction in the first
7 quarter of 2010, which would be the first part of the
8 year.

9 MR. MOCK: Well, the guidelines for dealing with
10 burrowing owls and other nesting birds is before
11 February 1st you do an exclusionary program, you do a
12 pre-construction survey. If you do find an occupied
13 burrow, you would exclude them from that burrow and
14 displace them and relocate them off-site so they're
15 physically -- they are not killed in the burrow, and you
16 also exclude them from the site prior to them laying
17 eggs.

18 So, basically, it would be a fairly tight
19 schedule. If they were planning to start in the first
20 quarter, so we would be doing a December-January type of
21 effort to assure that there is no direct mortality of
22 owls.

23 Right now, currently, the owls that are known
24 to occur in the vicinity are off-site. They won't be --
25 the ones that we know about don't occur in the area for

1 possible disturbance. But there are some potential
2 burrows on-site that could be occupied between now and
3 when the construction starts. So we will be doing
4 pre-construction surveys to verify that there are no owls
5 on-site.

6 MS. WEINER: Thank you. What about the
7 flat-tailed horned lizard? Are you planning to
8 translocate the flat-tailed horned lizard?

9 MR. MOCK: Basically there's a fairly low density
10 population on-site and so we --

11 MS. WEINER: You've already done surveys for the
12 flat-tailed horned lizard?

13 MR. MOCK: Two years worth of surveys, and I
14 think we've -- there are two species on-site, the desert
15 as well as the flat-tailed. So we -- presumably we will
16 be doing pre-construction surveys trying to find as many
17 as we can to relocate and then we'll have ongoing
18 construction monitoring to detect them and try to
19 minimize any mortality to those individuals as well.

20 MS. WEINER: Thank you. And I need to do a lot
21 more studying on this, but I understand that you have to
22 get a stream alteration permit from the --

23 MR. MEYER: Just to clarify that we -- Jim and I
24 represent the agencies overseeing it.

25 MS. WEINER: So I'm not looking at the right

1 person. I'm a little cross-eyed anyway.

2 MR. MOCK: We've contacted the Fish and Game.
3 And they've expressed the opinion that a stream bed
4 alteration agreement would be required if any of the
5 jurisdictional channels are modified.

6 MS. WEINER: And they said that would be on
7 public or private land?

8 MR. MOCK: Correct.

9 MS. WEINER: And that you will be disturbing some
10 of those channels?

11 MR. MOCK: Presumably there will be some road
12 crossings of the channels that will require some kind of
13 permit or agreement.

14 MS. WEINER: And you have to get that permit
15 before you begin construction?

16 MR. MOCK: Yes.

17 MS. WEINER: Whew. You guys have a lot of work
18 to do. Thank you.

19 MR. MEYER: Thank you very much.

20 MR. STOBAUGH: Again, we would like to encourage
21 everyone who has offered comments to, if you can, provide
22 us in writing as much as what you have, or even copies of
23 what you have used in there, so we can pull this
24 information together in walking forward with this
25 analysis.

1 So, it's always more accurate to get it in
2 writing so we're not guessing what you may have said, you
3 know, or from the comments being taken down from the
4 verbal stance.

5 MR. MEYER: The Applicant has informed me that
6 they have extra copies of the document that they will be
7 providing to the three individuals who have requested
8 them. So thank you very much.

9 Okay, are any other members of either the
10 public or any agencies that might be represented? I
11 usually ask that in the beginning, but with my little
12 technical issues I was so focused on my computer, that I
13 forgot to ask if there are any members of State or local
14 government that are here who would like to introduce
15 themselves?

16 And since there aren't, I will open up to
17 anyone else who would like to make a comment at this
18 point. Okay. And I will ask any of the other parties if
19 you have anything else?

20 MR. STOBAUGH: Again, we are going to have an
21 actual scoping period from the BLM's process that we do
22 want to meet as far as the requirement beginning at 5:00
23 and there will be an opportunity provided there in case
24 any others have come in or those that have been invited
25 to at this point in time generate some comments they want

1 to make at that point in time of which they will be
2 captured.

3 The scoping, again, is BLM's process to where
4 we solicit this external input that we can over what
5 would be the issues or the impacts or potential
6 alternatives that may be suggested or looked at. And we
7 take those down as part of our National Environmental
8 Policy Act requirements to develop and prepare an
9 environmental impact statement.

10 So this is, if you will, BLM's gathering
11 mechanism of information. And like you have been
12 discussing for this portion here with CEC, you may make
13 verbal comments. But, again, we want to stress for
14 accuracy sake, please provide us those in writing so we
15 are not -- so we are getting it right.

16 Again, if you wish to speak, on the break
17 here there is a form out front, Solar Two Project Comment
18 form which gives us your name, who you represent, and the
19 contact information so we know who we can expect to come
20 up and speak. Otherwise, a lot -- that will be -- there
21 will be a presentation by the Applicant as well as
22 explaining the process by California Energy Commission
23 and BLM's processes. And then with the public comment
24 period we will then move into the -- what is kind of an
25 open house and you may walk around and view the placards

1 that -- really nice placards that provide a lot of
2 information as far as if you need additional --
3 additional information to understand what this project is
4 all about and the lands involved.

5 MS. HARMON: Am I correct in understanding that
6 we have until January 2nd to get our written scoping
7 comments in?

8 MR. STOBAUGH: Very good point. The actual
9 formal scoping period for BLM's part of this process is
10 15 days after the last meeting, which is today, which
11 falls on January 2nd.

12 With that said, as the notice came out, on
13 the website in here you will be seeing during the
14 presentation show BLM's website. They will all be
15 funneled to the California Energy Commission who is the
16 primary lead on developing the document that is, again,
17 their staff assessment and our environmental impact
18 statement, so you will have the information of where to
19 send your comments to.

20 MR. MEYER: I will basically just be acting as a
21 clearinghouse. If it's like a BLM-specific issue I will
22 make sure it's on the overall record of our joint process
23 and then I will funnel it. And Jim will, you know, take
24 the lead in, you know, making sure any BLM specific
25 issues are addressed.

1 MR. STOBAUGH: I'm glad you asked the question,
2 Edie. And we were going to talk about it a little later.
3 But, yes, if you haven't stated it or provided it at this
4 meeting today, you do have until January 2nd to provide
5 it to us. Again, we encourage you to always put it in
6 writing.

7 MR. MEYER: I think we have wrapped it up a
8 little early. And as Jim said, we will be reconvening at
9 five o'clock to start the BLM scoping process. Thank you
10 very much everyone, and I will see a lot of you in just
11 about an hour and a half.

12 (Workshop recessed at 3:30 p.m. to be resumed at
13 5:04 p.m.)

14 MR. STOBAUGH: I'd like to welcome everybody.
15 This is the second half, I guess, of the show today. The
16 first part was the Workshop. It was a Data Response and
17 Issues Resolution Workshop we held from, basically, 1:00
18 to 3:30 is what it went to, which was the discovery
19 aspect of the California Energy Commission's process.

20 This process, this part of the -- the
21 program, if you would, is BLM's scoping meeting, which
22 will be looking at offering the public an opportunity to
23 -- we solicit to the public an opportunity to come and
24 give us its input, if any, on the types of issues, and
25 possibly considerations, that we would want to -- you

1 would wish for us to have as we begin moving through our
2 National Environmental Policy Act requirements in
3 preparing an Environmental Impact Statement.

4 So this is the second scoping meeting as far
5 as the Environmental Impact Statement requirements under
6 NEPA. And the way it's going to work is we are going to
7 do -- have a presentation by the Applicant, Stirling
8 Energy Systems, about the Solar Two Project. They have a
9 Power Point presentation. And then we were going to do
10 -- show you, if you want, the processes of how BLM walks
11 through the -- both BLM and the California Energy
12 Commission walks through its processes and how you may
13 participate in providing any type of input with a contact
14 and information.

15 Okay, so we're going to do ours first?

16 MR. MEYER: Why don't we.

17 MR. STOBAUGH: Okay, to show you how flexible and
18 dynamic we are going to be, we're actually going to do
19 the Bureau of Land Management and California Energy
20 Commission. So those handouts I was talking about are
21 immediately of need right now.

22 Again, I'm just going to introduce myself
23 before we get started. I'm Jim Stobaugh, the assigned
24 Project Manager for the Bureau of Land Management with
25 this project. It's actually being processed through the

1 El Centro Field Office, which is a part of the California
2 Desert District.

3 We have some BLM folks out there in the
4 audience with us, and I'm going to ask you, if you would,
5 to introduce yourselves and let us know whether you are
6 with the Field Office or the District so folks see who
7 the BLMers are in attendance. Al, starting with you.

8 MR. STEIN: I'm Al Stein. I'm the Deputy
9 District Manager for Resources at the District Office in
10 Moreno Valley.

11 MR. MEYER: Thank you.

12 MS. PEREZ: I'm Mary Perez. I work at the El
13 Centro Field Office. I'm the archeologist.

14 MR. ZALE: I'm Tom Zale. I'm the Associate Field
15 Manager for BLM's El Centro Office.

16 MR. STOBAUGH: I think that's it for BLM here
17 tonight. All right. I'm going to turn to Christopher
18 Meyer.

19 MR. MEYER: Hello. I'm Christopher Meyer. I'm
20 Jim's counterpart over at the Energy Commission doing
21 sort of our part of the dual process and working as a
22 project manager there. So I have --

23 MEMBER OF THE AUDIENCE: A staff of one.

24 MR. MEYER: I have two because actually I do
25 count my staff attorney, Karen Holmes, in the back. And

1 I also have Mike McGuirt who is the archeologist for the
2 Energy Commission working on this project. I'll turn it
3 over to the Applicant.

4 MR. HARPER: My name is Kevin Harper. I'm the
5 Project Manager for Solar Two. We have a number of staff
6 here from URS, and I'll just go through their names now.
7 Angela Leiba, URS Project Manager; Corinne Lytle, URS
8 Project Manger; Emily Bierman, Public Involvement
9 Specialist; Julie Mitchell, Air Quality; Pat Mock,
10 Biological Resources; Teresa Miller, Biological
11 Resources; Brian Glenn, Cultural Resources; Bob Mutaw,
12 Cultural Resources; Ginger Torres, Land Use; Seth
13 Hopkins, Socioeconomics and Visual Resources; Noel Casil,
14 Traffic and Transportation; Matt Moore, Water Resources;
15 and last Tricia Winterbauer, Waste Management. Okay,
16 she's on the phone. Do we have her on the phone?

17 MR. MEYER: We can probably have someone call in
18 if we need her. And, also, just to mention we'll get
19 into this a little bit in our presentation, but an
20 integral part of the Energy Commission's process is
21 opening it up to parties who want to participate more
22 fully.

23 And one of the options is to become a formal
24 intervenor in our process where you have additional
25 rights. You have a seat at the table. You can provide

1 testimony. There are a lot of -- There are advantages,
2 disadvantages. You have to serve all the parties when
3 you're producing information and you get to be
4 cross-examined just like the rest of us when anyone
5 disagrees with you.

6 So, speaking of that, I will introduce -- we
7 have an Intervenor, which is California Unions for
8 Reliable Energy.

9 MR. FOLEY: And my name is Paul Foley. I'm here
10 on behalf of the California Unions for Reliable Energy.
11 And we have petitioned to intervene in this proceeding,
12 and the petition has been granted.

13 MR. MEYER: Thank you, Paul. Back to you, Jim.

14 MR. STOBAUGH: Again, thank you. Again, I want
15 to extend a welcome especially to those folks in the
16 public here. I have what are the, as requested prior to
17 the meeting, I have four people that have signed up to
18 provide public comment. I'll ask you to come forward
19 here. We do have a couple of folks recording what is
20 being spoken. But I always, as Christopher talked about
21 in the prior meeting between 1:00 and 3:30, and we also
22 mentioned at our first meeting on November 24th in these
23 same chambers, we really want to encourage you to provide
24 your comments in writing so that we aren't missing
25 anything through our capturing it, if you would,

1 verbally. So I always just want to stress that.

2 That way we make sure we are getting verbatim
3 the issues you wish raised or wished placed into the --
4 as part of the scoping process. So I just can't
5 emphasize that too much. I'll tell you what, I'm going
6 to, as I said, we will go through this presentation of
7 BLM and the California Energy Commission's processes and
8 request for public input. And then we will turn to the
9 Applicant about the project itself before beginning the
10 public comment period. Okay? Any questions on the
11 process so far? Okay.

12 Just kind of as an overview of what we are
13 doing, at least from BLM's scoping requirements, under
14 Federal law BLM is responsible for processing Stirling
15 Energy Systems application for rights-of-way and to
16 authorize this proposed project and associated
17 transmission lines and other facilities to be constructed
18 on the lands that BLM manages.

19 We have to look at processing those
20 applications and to comply with the requirements of the
21 National Environmental Policy Act, which I may say NEPA
22 later on, which, of course, requires the Federal agencies
23 to consider the environmental impacts associated with
24 such a project.

25 If I could put in what is actually the

1 purpose of the action in front of BLM, the purpose of the
2 BLM action is to provide the Applicant a decision in
3 processing its application for right-of-way grant for the
4 legal use and access of the public lands in Imperial
5 County, California, managed by BLM.

6 The need for BLM action is established by
7 BLM's responsibility under the Federal Land and Policy
8 Management Act. That's the granting authority that would
9 be used for rights-of-way, NEPA, as well as other
10 environmental laws, such as National Historic
11 Preservation Act, as we go through to reach a decision to
12 approve or deny or modify, if you would, what is being
13 proposed in front of BLM to construct, operate, and even
14 decommission this proposed concentrated solar thermal
15 generation plant and related facilities.

16 So kind of in a nutshell, the decision to be
17 made is whether or not to grant the right-of-way, and if
18 so, under what terms and conditions would we issue such a
19 grant. The other thing that's happening with this
20 proposal is that it triggers the need for a land use plan
21 amendment under the current BLM/California Desert
22 Conservation Area Plan that was at first established in
23 1980 and has been amended. And then the purpose of the
24 Plan Amendment is to ensure that the multiple use
25 identified in FLPMA, while managing the valid existing

1 rights and resource demands as well as the technological
2 developments is being met on the public lands.

3 So if we look at that part of the plan
4 amendment requirement on there, what really is triggering
5 this is the statement in the plan that says: Sites
6 associated with power generation or transmission not
7 identified in the plan, as in this case, will be
8 considered through the plan amendment process.

9 So we are able to merge, if you would, both
10 our land use planning, which would require amendment,
11 which would require an environmental impact statement in
12 this case, along with this environmental impact statement
13 to process this decision under FLPMA.

14 The beauty of what we are doing as we have
15 kind of learned from today is through a memorandum of
16 understanding, BLM and the California Energy Commission
17 are conducting dual processes here, which we are about to
18 cover. But the beauty of that is, really, for us to
19 avoid duplication and to share our expertise, you know,
20 as far as the information we have, and to promote what is
21 intergovernmental coordination at the local, state, as
22 well as federal levels.

23 I think it is being manifested here today by
24 you have the Federal government, you have the State
25 government, and here we are meeting in the County

1 facilities to exercise and walk through this process.
2 And, of course, you importantly with the scoping of this
3 as well as discovery from earlier, is what is the
4 public's input as far as we walk through this public
5 participatory process. And that's what we are providing
6 in this opportunity.

7 So the first part of it is kind of formal in
8 that sense, but after the public comment it will
9 basically become an open house to where there won't be
10 any further statements, and you can walk around. And if
11 you provide us any questions or comments, we ask it be
12 done in writing and submitted so, again, the accuracy of
13 what you are asking us to consider is captured by your
14 own language. Okay. Any questions?

15 Okay. I guess I'm ready to start walking
16 through. Is somebody going to flip the slides for me as
17 I start walking through here? Thank you. That's good.
18 I'm not sure I can do both at the same time.

19 Okay, again, as this initial slide shows
20 here, it kind of explains the Data Response and Issues
21 Resolution Workshop and Scoping Meeting.

22 BLM's role. Basically, as I said, you can
23 see it there is we administer the public lands through
24 the Federal Land Policy Management Act, FLPMA. We have
25 to review all of our land use planning and process, in

1 this case, the Land Use Plan Amendment. And that Plan
2 Amendment pertains to the California Desert Conservation
3 Area Plan initially passed in 1980 but has been amended
4 since then.

5 The issuance of a right-of-way grant is what
6 is, if you would, the product in the end or the
7 instrument that will be used to authorize such uses on
8 the public lands if approved. We are, the BLM, the
9 Bureau of Land Management, the lead Federal agency for
10 the National Environmental Policy Act compliance as well
11 as the National Historic Preservation Act and other
12 Federal laws.

13 MR. MEYER: And on our side, the Energy
14 Commission, when we talk about NEPA and CEQA, the Energy
15 Commission's role, the BLM's role, we are doing anything
16 but working in a vacuum, as Jim has explained. Jim and I
17 have a lot of discussions, BLM staff, Energy Commission
18 staff do a lot of work together to make sure that we are
19 proceeding in tandem working together and basically
20 relying on each other, depending on who has the, you
21 know, the greatest expertise in each area.

22 Our -- the authority of the Energy Commission
23 is for thermal power plants over 50-megawatts. And when
24 we talk about thermal, for people who really aren't
25 familiar with what we're talking about, it's any plant

1 that produces energy based on heat, whether it's
2 geothermal, you know, natural gas fired, something of
3 that nature. Or in this case a solar project that gets
4 its energy through heat. If it's something like a
5 photovoltaic plant, it doesn't use heat and therefore
6 it's not considered a thermal project. Wind, by the same
7 matter, is not considered a thermal project and those
8 aren't under our jurisdiction. But a lot of these large
9 solar plants you'll see coming up do fall under the
10 Commission's jurisdiction.

11 And we also look at related facilities, such
12 as the transmission lines, any of the related facilities
13 that are part of the project. You will have some
14 projects where the transmission line is not actually a
15 part of the project. We look up to the first point where
16 it interconnects into the grid system run by the utility,
17 and then after that we just look at it as, if it's
18 necessary for the project, we look at it as a reasonably
19 foreseeable impact and look at it from that aspect. But
20 we don't actually include it as part of the project
21 permit.

22 And from our aspect, we are the lead state
23 agency for CEQA, which is the California Environmental
24 Quality Act. And as part of, you know, what Jim and I
25 will be working on is to make sure that we work with

1 both, you know, other Federal agencies, other State
2 agencies as well as local government to make sure that,
3 you know, where we can, we use their expertise in
4 specific issues that they look at in their normal process
5 to incorporate those into our review.

6 MR. STOBAUGH: By the way, this list that we have
7 on the handout, the State and Federal agencies, isn't
8 necessarily the fully exhaustive list. There may be
9 others as well as we brought up earlier the Army Corps of
10 Engineers.

11 MR. MEYER: The Energy Commission's process, you
12 know, has three major steps. The data adequacy process
13 we have already gone through, which is basically it's our
14 initial very quick, we have 30 days to do a review of the
15 application we get and see if it has the basic pieces
16 that our regulations require. We have very specific
17 regulations that say that each application that comes
18 before us has to have certain key issues in the
19 application to be complete just for us to look at it and
20 start our review process.

21 This process we already went through that.
22 They made a few corrections, a few additions. They were
23 deemed data adequate. And that starts the official
24 review process which brings us into the discovery and
25 analysis. This is where we are now. The data requests

1 have gone out. There may be additional ones. It depends
2 on what questions we have after looking at all the data
3 responses that are coming in shortly for air quality and
4 cultural, but we will have things of this nature where we
5 get the data responses and we work in meetings such as
6 this to ask any additional questions.

7 The issues identification is -- it's a
8 general report we put out very early, and we did that
9 back before the November 24th meeting, where it says: In
10 our very early review of the process working with BLM,
11 the Energy Commission identified certain areas that we
12 think are going to possibly take additional time and
13 possibly complicate the process.

14 So we know up front both the Energy
15 Commission agencies and the public need to pay particular
16 attention to certain areas. And I won't put everyone to
17 sleep by reading every slide verbatim. But, really, the
18 third portion is where after staff has worked with the
19 BLM, we put our draft document together, it's reviewed.
20 Then from our standpoint, I step back, turn it over to a
21 committee which is two of our commissioners and they put
22 out a proposed decision. And we will be working to meld
23 that process into the BLM's process.

24 So -- and I think we can go through these. I
25 covered them verbally, but in the handout that Jim

1 provided you'll have a record as you go through this
2 process of what the different steps are. And these are
3 really good handouts to have because they also have
4 contact information. And this gives you just a little
5 bit more detail.

6 When we are referring to the PMPD, it's the
7 Presiding Members Proposed Decision, and that is that
8 deciding committee, which have two of the commissioners
9 from the Energy Commission have been assigned to this
10 case in particular. And they will be following it and
11 making recommendations towards the end to get a decision,
12 a proposed decision, that will then go to the full
13 Commission.

14 And one thing we talked about here is the
15 Energy Commission monitors compliance with all conditions
16 of certification. We have a special unit that their sole
17 job is to watch these projects. If they're approved by
18 the Energy Commission to make sure that any conditions
19 that are imposed in the decision phase in the siting
20 phase, are carried out through the construction and the
21 operations phase right up until closure.

22 And, fortunately, in a project of this
23 nature, we are going to have the assistance of the BLM as
24 well, so it will be both the BLM staff and the Energy
25 Commission staff if the project is approved that will be

1 working throughout the life of the project to make sure
2 its constructed and operated in accordance with any
3 requirements that are made, you know, as I say, if the
4 project is approved.

5 MR. STOBAUGH: And what we have is the Bureau of
6 Land Management's Solar Energy Development Policy, which
7 is -- WO means Washington Office, Instruction Memorandum,
8 and this is the number 2007-097 that was issued in April
9 2004. It just kind of lays out in gist what's below,
10 that the policy there is to facilitate environmentally
11 responsible commercial development of solar energy
12 projects on public lands. And that the right-of-way
13 applications for solar energy are high priority and will
14 be processed in a timely manner.

15 Again, I have already talked about FLPMA,
16 which you can see is that bullet and there's the actual
17 title under FLPMA that this would -- a decision would be
18 made under. And, of course, with this one actually with
19 rental and being a site area, it's going to be developed
20 through appraisals.

21 If you want, on technology, solar technology,
22 there's a couple of websites for you there. The second
23 one if you see in there. One is the Department of
24 Energy, and the other one is, as you can see, the
25 National Renewable Energy Lab. That's what NREL stands

1 for. And it also provides you maps where you can see
2 where most of these projects are, which, of course, deal
3 primarily with the southwestern United States.

4 So, I don't have, and I apologize, I don't
5 actually have the Washington Office Instruction
6 Memorandum right there. But if you go to the next slide
7 I can show you where you can get it. Or if you want it,
8 you can write me an e-mail which you will see how to
9 contact me. I will see that they give you an electronic
10 version of what that policy is if you want the full
11 description of what that is.

12 But here is it right there. This all would
13 be processed or administered, if you would, under our
14 regulations found at 43 CFR 2800. And the toolkit is
15 basically the two general rights-of-way websites you can
16 use to find out information in general about BLM
17 rights-of-way and more specifically, as you can see,
18 solar rights-of-way at that particular site.

19 So, in any case, that's -- and, again, if you
20 want handouts so that you can go back and plug these into
21 your Internet address so that's what they are for.

22 MR. MEYER: Just a note, that if you later in the
23 process discover this would have been a really handy
24 handout, I have a pdf version of this that I can e-mail
25 anyone if you contact me.

1 MR. STOBAUGH: As far as just kind of capturing
2 real quick of what the BLM authorizing officer making
3 this decision is responding to the proposal, we're
4 running through this pre-application screening, and
5 that's a little bit of what's been going on up to this
6 point, along with the discovery and working with the
7 California Energy Commission.

8 And the application has been accepted at this
9 point, so we are processing it. And as you can see from
10 the green little stars, processing the application which
11 also triggers, as I mentioned earlier, land use plan
12 amendment under the current plan.

13 As you can see where we are in the process,
14 we are conducting the scoping. This is the second of two
15 scoping meetings. There will be BLM scoping. Formal
16 scoping will continue through 15 days after today, which
17 is basically January 2nd. So if you don't have your
18 comments put in to us in writing today, you through the
19 websites previously shown and contact information here in
20 a moment, you will see where you can submit those
21 comments to us.

22 Again, what we will do is what the whole
23 purpose of scoping is, is for us to solicit to the public
24 the opportunity to provide us their input so that we can
25 take this into consideration as we prepare this

1 environmental impact statement and land use plan
2 amendment. And as Christopher referred to a littler
3 earlier, in concert, if you would, with California Energy
4 Commission's staff assessment of this proposal as well.

5 So you are living with us this trial effort
6 to walk down and do both these processes to gain
7 efficiency both across Federal and State governments as
8 we walk through in trying to figure out ways to
9 complement each other's efforts, not duplicate them, use
10 -- share each other's expertise and staffs to be able to
11 do that and to streamline the processes as best we can.

12 And, you know, frankly, from a principle
13 standpoint I think it's just good, since it obviously
14 takes the review and the issuance of such a decision at
15 the Federal as well as the State level, why not have the
16 two processes married together and walk through and have
17 the open and transparent discussions at both levels,
18 including local governments as well.

19 And so, in essence, there's -- In fact, as it
20 says on the last bullet on there: We look at making this
21 decision and consideration all the way through the
22 termination of the project. So there is the
23 cradle-to-grave viewpoint. Next slide.

24 If you want a kind of a quick snapshot of how
25 the NEPA Environmental Impact Statement, Land Use Plan,

1 that's what LUP Amendment process goes, we have already
2 published on October 17th a Notice of Intent that we're
3 going to prepare an environmental impact statement. We
4 are on that second bullet as you see there, involving the
5 public scoping that will run through January 2nd.

6 And then we're going to look from that at
7 developing whatever alternatives may come out of this
8 process before the department of the draft EIS and draft
9 Land Use Plan Amendment. There will be the notice of
10 availability. There will be a 90-day comment period
11 afforded the public on the draft EIS.

12 As we take those comments and assimilate them
13 into what is the preparing of the final environmental
14 impact statement, as well as proposed land use plan
15 amendment, the first one was the land use plan amendment,
16 and then it becomes the proposed, there is a 30-day
17 review availability period as well as protest made at
18 that time following the publication of the notice of
19 availability in the Federal Register.

20 So, and then after that point there we look
21 at whether or not there is a decision, a record of
22 decision that will be made as well as the approved land
23 use plan amendment. And then we -- The other way we deal
24 with the mechanism is not only is there approval -- if
25 there is an approval, then there actually is a notice to

1 proceed in which we have laid out the monitoring of the
2 project and all the plans for monitoring what we are
3 about to approve.

4 MR. MEYER: Basically, as we talked about before,
5 this is just a good reference. When I was talking about
6 the committee assigned, the two commissioners, Jeffery
7 Byron is the presiding member. Right now Jacqueline
8 Pfannenstiel, the Chair, is the associate member but
9 she's actually leaving the Energy Commission, so we will
10 be finding out who our replacement is on the Committee
11 shortly.

12 And then that will go up on to the Energy
13 Commission's website. But the other players will remain
14 the same. Raul is our hearing officer, and this just
15 gives you general information. So I recommend if you
16 have a copy of this it's a good reference throughout the
17 process.

18 MR. STOBAUGH: And there is BLM's contact and
19 comment website information. My name is there at the
20 top. Again, you can see the phone number. You have my
21 e-mail address there as well. We have that web page.
22 It's right here, and it gets to where it's specific to
23 this particular project itself.

24 One thing to point out here is that the
25 scoping comments are actually being right now largely

1 filtered through or directed through Christopher there as
2 the project manager, California Energy Commission. So we
3 are trying to, if you would, narrow the avenues, if you
4 would, where to submit these comments so you make sure
5 you are getting them to the right source.

6 And you can see Christopher's e-mail address
7 right there, and it's suggested, attention Solar Two
8 because Christopher has a few items under his wing right
9 now, as well as I do. And I really want to thank
10 Christopher right now for being able to put his e-mail
11 address up there.

12 (Laughter.)

13 MR. STOBAUGH: But you can see mine is up there,
14 too, if you have comments you want to get to me. I'll
15 make sure Christopher gets them.

16 Again, this is kind of a dual slide we can
17 look at. But it's an open public process. We have both
18 these workshops, we have hearings, and I think I'm
19 actually eating into your slide on this, Christopher.

20 MR. MEYER: It's really a joint slide. It's just
21 additional information as I talked about before as far as
22 people participating in the process. We have different
23 ways you can get on mailing lists, get on the list
24 server, also talk to our public adviser's office to get
25 information. But there's also copies, hard copies of the

1 application for certification in libraries around the
2 area. So if you really want to see a hard copy, very
3 large document, you can go to the library and view it.
4 And usually they will have it in their reference room.

5 And just as we said before, Jim has said
6 several times as well, written comments are great. It
7 really affords us the opportunity to make sure that we
8 don't misinterpret any of the issues that you may have
9 and we can get them to the appropriate staff so we can
10 fully address your issues.

11 Forms of this nature, you know, you can give
12 oral comments, actually, can also be very helpful because
13 it allows other people in the community to understand
14 what your issues are. So sometimes that will help them
15 focus their thoughts as well. And, you know, that's why
16 your participation is really ideal as early as possible.

17 And we talked about briefly the issues ID
18 report, issues identification. And in the Issues
19 Identification Report really we focused on cultural land
20 use, visual resources, and then the cumulative effects,
21 which is really this project, but if you're looking at
22 the push towards renewable energy, everywhere in the
23 Southwest when you get, you know, a million acres of
24 public land that people will have applications out on,
25 and it's probably well in excess of that at this point.

1 If all of that, or even a good portion of that got built
2 out, your cumulative impacts would be much greater than
3 just this project alone or a bunch of little projects
4 here and there.

5 Their full impact on the environment when
6 added together can actually be greater than the pieces.
7 And, you know, these are just -- it gives you some of the
8 ideas, something just to keep in mind as you are reading
9 these. These are just from an initial look early in the
10 process, things that we want to focus on when we are
11 doing our analysis.

12 You know, land use, it's just -- you know,
13 this is over 6,000 acres of public land that would be
14 used for the production of power. And we just have to
15 look at that as a significant change in its
16 accessibility.

17 Air quality, as I said, we didn't identify it
18 early. It's just as we started delving deeper into the
19 project we started looking at just fugitive dust from the
20 site of this area and then just the operations impacts of
21 trying to clean, you know, well, 81 mirrors on 30,000
22 units. It's a lot of work, and it takes a lot of people
23 driving around, moving water, things of that nature.

24 So when you think of these projects you don't
25 think of air quality impact, but our staff, our job is to

1 work with the BLM and to really look at, you know, down
2 to a very minute level to make sure that we have
3 identified as many issues as we can in our initial
4 documents.

5 And visual resources, it's just sort of the
6 general, if you have 30,000 of these 40-foot tall units
7 on 6,500 acres, you know, it's not going to be an
8 invisible project. And Jim can probably talk a little
9 bit -- you know the VRM classification, that's a BLM
10 specific issue.

11 MR. STOBAUGH: Yeah. There are certain areas
12 there where you look at part of the process of developing
13 what would be the VRM classification for certain areas of
14 the proposal. They really -- that are being established
15 with this project.

16 MR. MEYER: Yeah. And as I said, there are
17 cumulative impacts, you know, that affect both CEQA and
18 NEPA analysis, so we will be working together on
19 developing one section on that. And that is our little
20 presentation.

21 MR. STOBAUGH: That was it. That was basically
22 an overview. Any questions about what we presented as
23 far as the proposal -- well, CEC and BLM's authorities as
24 well as the process that we are going to be using and how
25 we will be walking through this jointly before we turn

1 this to the Applicant and the proposal? Yes, it's about
2 the process? Okay. Come on up if you're going to speak
3 at all. Edie, we actually have a segment where public
4 comment can be taken.

5 MS. HARMON: You asked if we have questions on
6 the process, and I do. I have a very specific question
7 on the process. And this stems from reviewing other BLM
8 documents.

9 You said that there was going to be a real
10 estate appraisal, that rental value would be based on
11 real estate appraisal. And I'm going to ask right now
12 that that real estate appraisal be public so that we can
13 look at how you have done it.

14 And I ask this from having challenged a BLM
15 real estate appraisal before. It went to court, and my
16 understanding is that BLM has changed the procedures.
17 But I definitely would like to see that and to make sure
18 that when you are doing appraisals, you are actually
19 comparing the potential value of land that is zoned for
20 industrial with all the infrastructure and not just
21 looking at the value of blank land.

22 MR. STOBAUGH: Well, first of all, I'm not an
23 appraiser, but that will be done by our sister agency
24 Appraisal Directorate Services, and they will be looking
25 at the highest and best use for the lands. And they will

1 determine that through comparables that fit this
2 scenario.

3 MS. HARMON: That's why I would like it public.
4 I would like to be able to look at what your comparables
5 are that you're comparing it to.

6 MR. STOBAUGH: Right. So, any process questions?

7 MS. WEINER: Just one simple question. What is
8 your proposed date of release of your draft Land Use Plan
9 Amendment?

10 MR. STOBAUGH: Right now that is very fluid. We
11 have a lot -- this scoping is retrieving or requiring
12 retrieval of a lot more data, so I can't really tell you.
13 It's speculative at this point.

14 MS. WEINER: So that prompts a follow-up
15 question, which is the schedule for beginning of
16 construction will be according to the rest -- that other
17 process has to be finished before they put a bulldozer on
18 it.

19 MR. STOBAUGH: Sure. It actually has to be
20 granted.

21 MS. WEINER: Okay.

22 MR. STOBAUGH: At least as far as the public
23 lands go, yes.

24 MR. MEYER: If I can answer that as far as the
25 private. This is in no way a pre-approved type

1 situation. We have a long process to go forward before
2 we would even offer the Energy Commission side have
3 approval or recommendations for either approval or denial
4 of the application just to build the facility. So there
5 are two parts.

6 They have to get approval from the BLM to
7 have, basically, access to the land, and then approval
8 from the Energy Commission to actually build the
9 facility. And so that's -- there are several steps that
10 they have to go through.

11 So, no, there's no way that they can actually
12 do any work without approval from both of our agencies.

13 MR. STOBAUGH: So any other questions? Okay.
14 I'd like, if we can, move now so you can hear from the
15 Applicant, Stirling Energy Systems, of what the proposal
16 actually is, the technologies involved as well as the
17 thoughts already behind it there. And they have been
18 working on this a lot longer than just Christopher and I
19 have. John, should I hand it to you at this point?

20 MR. EGAN: Thanks a lot, Jim. My name is John
21 Egan. I'm in charge of project development for Stirling
22 Energy. And this is not the only project we have. We
23 have another project even larger up near Barstow.

24 The picture you see on the screen is an
25 actual picture of what a SunCatcher looks like, and this

1 is a model power plant that exists in Albuquerque, New
2 Mexico at a place called Sandia.

3 In the presentation today I'm going to tell
4 you first what I'm going to tell you and that's -- the
5 agenda is I'm going to tell you about Stirling Energy
6 Systems. I'm going to tell you about the purpose of
7 Solar Two, the SunCatcher technology, how this thing
8 works, the overview of it, a project description, talk
9 about the different resource areas, the Solar Two Project
10 benefits, some common questions that come up on our
11 project.

12 First about Stirling Energy. Stirling Energy
13 has come up with what we consider to be a very unique
14 SunCatcher technology that combines a mirrored
15 concentrator disk that you saw in the early pictures with
16 a very high efficient Stirling engine specifically
17 designed to convert sunlight into electricity.

18 This is not a new technology. The original
19 technology goes clear back to about 1816. And it was
20 invented by a Scottish minister in the days of steam
21 engines. When the steam engines were blowing up and
22 killing people, the guy came out with a new model of the
23 heat engine that converted heat to mechanical energy.

24 Our technology has been on the ground since
25 1984. We currently hold one of the world's records for

1 efficiency in converting energy into electricity. And
2 it's at 31.25 percent. And what that means is of a
3 hundred percent of the light that hits our mirrors,
4 31.25 percent of that gets converted into electricity
5 that goes into the grid.

6 We are a United States company. We are
7 headquartered in Phoenix, Arizona. We also have offices
8 in Tustin, California, Albuquerque, which is at Sandia
9 National Labs in New Mexico. The purpose of the Solar
10 Two Project is to provide 750-megawatts of renewable
11 electrical capacity under a 20-year power purchase
12 agreement, better known as a DBA, San Diego Gas &
13 Electric, also known as SDG&E.

14 We are trying to develop renewable solar
15 electricity to help California achieve its Renewable
16 Portfolio Status, known as RPS, which was raised recently
17 by Governor Schwarzenegger to 33 percent renewables by
18 2020 when he signed the Executive Order in November 17th
19 of this year.

20 What we would like to do is help protect the
21 environment by delivering clean renewable solar energy to
22 the grid. And we would also like to assist the State of
23 California in meeting its goal of reducing greenhouse gas
24 emissions to the 1990 levels by 2020, which is known as
25 Assembly Bill 32.

1 Overview of the technology. It's basically
2 somewhat simple. It just uses sunlight. The sunlight
3 comes in, hits the mirror surface. The mirror surface is
4 about 40 feet tall and 38 feet wide. That sunlight then
5 is reflected back into the back of an engine. That
6 engine converts the sunlight into mechanical energy which
7 drives the generator. And the generator, you can see up
8 here at the top of the unit, it's called a power
9 conversion unit. The light enters the back of the engine
10 and by using hydrogen gas in an enclosed system, it
11 drives a four-cylinder engine that produces 25,000 watts
12 of power for each unit.

13 Each unit only touches the ground, as you see
14 here at the bottom, in about a two-foot circle. The rest
15 of the ground is not touched by the unit. We get
16 approximately seven of these per acre. One of the
17 interesting things about the technology is it's probably
18 the only solar technology that has the potential for
19 putting some of the U.S. auto plants back to work.

20 The engine is not unlike a car engine. It
21 works quite -- very similar to a car engine. So these
22 engines could actually be built in shut down car
23 manufacturing plants and help put Americans back to work
24 to help us get off foreign oil.

25 We are designed to produce power during the

1 peak generation periods. Obviously, we only generate
2 power when the sun shines. During that time period is
3 when the bulk of us use the bulk of our power. The
4 engine's about the size of an oil drum, so it's not very
5 large. It has no combustion products, it has no air
6 emissions, it doesn't use hazardous heat transfer fluids,
7 and it doesn't use any fossil fuel infrastructure
8 on-site. It's cost competitive, can be mass produced
9 very similar to what Ford did with the Model T. We can
10 produce them by the thousands. It has zero pollution and
11 it provides peak power when we need it the most.

12 So the Solar Two Project, most of you in the
13 area are familiar with the area, and it's basically
14 located just south of Plaster City due west of town. We
15 have got it divided into two phases. Phase One at
16 300-megawatts, Phase Two at 450-megawatts.

17 Phase One does not rely on the Sunrise Power
18 Link. Phase Two and the combined project does. For
19 those of you who haven't heard, the Sunrise Power Link
20 was passed today at a vote of four to one.

21 The Solar Two will be one of the world's
22 largest solar projects. Our other project we have near
23 Barstow is actually a little larger than this, but this
24 is 750 net megawatts of solar power located on
25 approximately 6,140 acres of Federal land, administered

1 by BLM, as you have heard today. There's also 360 acres
2 of private land interspersed inside the area, which
3 equates to about ten square miles of total land.

4 We tried very hard to site this project to
5 avoid or minimize impacts to the ORV areas and
6 environmentally sensitive areas. Solar Two would consist
7 of approximately 30,000 of these units, including the
8 power conversion units, associated equipment and support.
9 An interesting thing about the technology is we use very,
10 very little water in the power conduction process, 32.7
11 acre feet at 750 megawatts. An acre foot, for reference,
12 is about what a four-bedroom home uses in San Diego. So
13 our water consumption is very minimal and that is used
14 mostly to wash the mirrors.

15 The project, again, will be in two phases.
16 Phase One is 12,000 SunCatchers, up to 300 megawatts. It
17 would fill the existing transmission lines. Phase Two
18 will expand out with another 18,000 SunCatchers and
19 produce 450 additional megawatts.

20 Subject to receiving the necessary approvals
21 that you have heard here tonight, we would like to start
22 construction about 2010, with the project going
23 commercial operation later that year. One interesting
24 thing about our technology compared to practically
25 everybody else is as soon as you put one SunCatcher in

1 the ground, you can turn it on and start generating
2 power.

3 What does it look like? Well, it's hard to
4 hide 30,000 SunCatchers. It will be visible. I would
5 expect it to be a -- something that would actually
6 attract people to come look at it because renewable
7 energy is becoming such a focus of this country, and we
8 need to get off of foreign oil so bad.

9 But this bottom picture is kind of what it
10 would look like if you're coming down the freeway. The
11 other picture is sort of like a semi-aerial view of
12 looking down on the site.

13 The project schedule, depending on permitting,
14 looks something like this. In the second quarter of this
15 year we filed the AFC, or Application for Certification.
16 In the fourth quarter of this year we received
17 certification of that AFC. We would like to start
18 construction about the first quarter of 2010. Through
19 the third quarter of Phase One, we would like to get the
20 first units on-line. 2012, we would like to start Phase
21 Two, with the first units coming on-line also in 2012.
22 2014, we would like to complete the entire project up
23 through 750 megawatts.

24 The resource areas you have heard quite a bit
25 about tonight. Cultural resources, we've done a

1 tremendous amount of work to try to avoid as much as
2 possible the archeological and historic architecture. We
3 conducted pedestrian surveys. And we are doing our best
4 to avoid potential adverse cultural effects of the
5 project. We actually chopped off a large portion of our
6 project to avoid a very high density archeological area
7 at an extreme cost to the company.

8 Visual resource surveys were conducted,
9 including the preparation of visual simulations from
10 various points in the area. One of those -- actually,
11 two of those you just saw. It will change the visual
12 character of the area. Again, we can't hide this. The
13 land use, we intentionally tried to avoid areas, again,
14 that avoided the sensitive ORV issue of the area. And it
15 will require the approval of the land use amendment and
16 issuance of a right-of-way grant from the BLM in order go
17 toward.

18 Now, what are the project benefits of this?
19 Solar Two will develop renewable solar energy to help
20 California achieve the RPS goal, which have you heard so
21 much about and assist California in meeting its goal to
22 reduce greenhouse gas emissions to 1990 levels by 2020.
23 Jobs, approximately 160 permanent jobs in the area. And
24 if you put a three-oh multiplier on that, which is pretty
25 common, you get almost 500 permanent jobs this will

1 generate in the area. It will lead to increased sales
2 revenue, people coming in to construct, operational
3 employees, and jobs for local people during construction
4 as well. We would expect a payroll of approximately
5 \$60 million in construction payroll and an average
6 construction workforce of approximately 360 jobs, for a
7 total project value of about a billion dollars.

8 Education benefits we have already started.
9 We have been working with local schools in trying to help
10 as much as possible to bring people from the local area
11 into our project to work on it. I would expect potential
12 boost in tourism, too, because most people certainly
13 would like to see the world's largest solar plant.

14 Other resource areas, biological. Solar Two
15 is sited outside critical habitat areas. We have
16 conducted two years of extensive biological surveys. We
17 have three potential sources of water, including the IID,
18 westside main canal, ground water. There is also
19 potential for reclaimed waste water as well.

20 Water quantity, again, about 32.7 acre feet
21 of water a year to generate 750 megawatts. And as an
22 example there of what a natural gas fired power plant of
23 comparable size would use, you can see it's considerably
24 more in acre feet.

25 Socioeconomic benefits include increase

1 revenue from sales tax, job creation, and the potential
2 boost to tourism. The cumulative effects, the most
3 notable potential effects, is that several renewable
4 energy project applications near the project site are
5 being processed so that we are not the only ones that are
6 interested in Imperial County. There are other projects,
7 also, that you have also heard a little bit about
8 tonight. And we're working with the agencies that are
9 here at the table to define appropriate mitigation for
10 our impacts.

11 Alternatives. This project was selected as
12 superior to meeting overall objectives while avoiding
13 significant impacts. And we did look at several -- quite
14 a few other areas as well.

15 Some of the common questions we get on this
16 is this is not a proven technology. I have heard this a
17 lot. The key thing here is this is not a new idea. It
18 goes clear back to 1816. It's been used as an engine to
19 propel submarines both in Sweden and in France. In our
20 testing it has proven itself to be extremely reliable.
21 And we have tested this motor and dish in a team
22 relationship with the DOE at Sandia National Labs for
23 over ten years. This is not a new technology, and we
24 would not proceed on a billion dollar project without a
25 reliable engine and system.

1 So right now we are one of the world's
2 leading technologies, at least on efficiency. We have
3 over 165,000 hours of testing on the motor. We have over
4 100,000 hours testing on the concentrator, and over
5 40,000 hours on the combined unit, on what we call
6 on-sun, or where it is an actually in operation.

7 Another question that comes up is, well, will
8 SDG&E really need the power until 2014? And the key
9 thing here is back to the RPS standard. The RPS standard
10 is needed now and will continue with the new requirement
11 to go to 33 percent by 2020. Another key point is we
12 need to switch from fossil fuel power generation to
13 renewables as soon as we can in this country. We need to
14 reduce or stop CO₂ production and to assist the State of
15 California in meeting its goal of reducing its greenhouse
16 gas emissions to 1990 levels by 2020.

17 There are some addresses here, and if you
18 would like, I could leave this up for those of you who
19 would like to take notes on it. Again, this is what the
20 units look like when in operation. So I will leave this
21 on the screen for those of you who would like to take
22 notes on it. Thank you very much.

23 MR. MEYER: Thank you. I'm going to bow out and
24 I'm going to turn this over to Jim. Unfortunately, I
25 have a flight to catch so I can get up for the work on

1 actually the Solar One Project I have to get working on
2 tomorrow morning. So I didn't get to use my gavel, so
3 I'm going to pass this over to Jim.

4 MR. STOBAUGH: Go ahead and rap it once.

5 MR. MEYER: Thank you very much, everyone. And
6 there will be a record of the rest of this, the public
7 comments, and I will be reading through those to see if
8 there are any issues that directly impact our staff. And
9 I'm thinking some of the people might remain here. So I
10 will be hearing all your comments, I'm sure, from a lot
11 of sources. But thank you everyone for coming out and we
12 look forward to seeing you at future meetings. Thank
13 you.

14 MR. STOBAUGH: Christopher, I appreciate your
15 help on the earlier session we had which was quite
16 informative for, I think, everybody involved here with
17 all your coordination. It's been a pleasure working with
18 Christopher and his highly organized fashion of doing
19 things, and the CEC folks which was manifested today as
20 well. So thank you, Christopher, for all the CEC's help
21 on this.

22 (Applause.)

23 MR. STOBAUGH: I would also like to say thank you
24 for that presentation there by John Egan there with
25 Stirling Energy Systems because I think it does help give

1 you a better idea about what is this proposal, its scale,
2 the various resources that may be used. Drive safe,
3 Christopher. And then the various resources that may be
4 used involving this project itself.

5 So at this point in time, that's kind of all
6 the presentations, if you would. And what I have here is
7 so far five people that have signed up to provide public
8 comments for this session. And I'm going to just -- I'm
9 going to name them in the order that I was given them.
10 If I get your name mispronounced, please correct us. I'm
11 going to ask you to come up here and speak so we can get
12 it captured as far as what your comment may be.

13 We have this room until one hour, basically,
14 from now, until seven o'clock. And so I'm going to ask
15 that we finish at least I'm going to say ten minutes
16 before then as far as the comment period goes to kind of
17 work in the last-minute considerations, if you would.

18 So with that being said, roughly that
19 provides everyone with that's given me the five, count
20 them, five cards here, roughly about ten minutes maximum
21 to discuss. So I'm going to reserve the right to kind
22 of, you know, for you to go roughly about that time
23 period and ask that we move at least and provide
24 everybody equal time to speak.

25 So right now I have five cards and five

1 people that wish to comment here. I will just start off
2 with Teri Weiner. Teri represents the Desert Protective
3 Council. So, if you would, state your name and who you
4 represent and then provide us your comment.

5 MS. WEINER: Good evening. Teri Weiner,
6 W-e-i-n-e-r, I'm Desert Protective Council, resident of
7 San Diego, California. I'm trying to put in my mind what
8 is being asked of us here. I'm trying to verbalize that
9 we, the people of Southern California and of the desert
10 areas, people that care about the desert, are being asked
11 to, essentially, sacrifice ten square miles of our public
12 lands for the higher good of the needs of California to
13 have renewable energy and reduce our carbon footprint.

14 What I would like to see addressed in the
15 draft EIS is an economic analysis comparing, you know,
16 the cost of putting up this project as compared with
17 developing renewable energy in the cities on rooftops, on
18 parking lots, on government buildings.

19 You know, it's just assumed that this is the
20 way to go, when we have been working with engineers and
21 people and different energy groups have shown that there
22 are viable alternatives to taking large pieces of public
23 land to do this. We can do this in the city.

24 So I'm trying to figure out how the BLM and
25 the CEC needs to address the fact that we should, you

1 know, for the sake of our public lands, which are of
2 finite -- they are being -- they are being barraged with
3 requests for projects, not just energy but military base
4 expansions and housing projects and sucking dry aquifers
5 and everything else, that we somehow look at the
6 alternatives to this project which aren't in the desert.
7 I think this is important. And I think the people of
8 California are ready to engage themselves and not be
9 relying on huge companies to bring them energy and
10 transmit it from their public lands.

11 The desert looks like a wasteland to a lot of
12 people that don't spend time here. It's a habitat of
13 fabulous value, and the visual -- the visual resources
14 is, you know, kind of looked at as a non-issue. It
15 isn't. Our visual resources that are untrammelled by
16 human infrastructure, industrial infrastructure, are
17 becoming, you know, very scarce out here. So, there's
18 that point.

19 Nobody has mentioned the view, you know, as
20 you were coming down from Hill Cumba, you know, looking
21 on this, it will totally change the character of the
22 desert. It has been mentioned but I would like to see
23 the community character of Ocotillo being addressed.
24 Economic benefits are being touted, but what about
25 economic impacts? You know, maybe say what are those.

1 Well, I think we ought to think about what those are
2 because they are there.

3 And what about airplanes flying overhead?
4 What kind of flash in our eyes are going to be coming off
5 these mirrors? Has anybody considered the air space
6 above this? And I urge you, I urge you to engage Native
7 American tribes, not just the leaders of the tribes and
8 the bureaucracy of the tribes, but some of the Native
9 American elders of the tribes and engage them immediately
10 and have them take you out there and identify what's out
11 there and talk to you about it's not just a matter of
12 this site or that site or that area; it's a matter of the
13 integrity of the cultural heritage of the whole that
14 needs to be addressed.

15 And the water usage, you know, again, we have
16 a desert. We have a water crisis in California that is
17 probably going to be the most -- the most important thing
18 that we are going to deal with in the next ten years.
19 Can we justify this use of water to wash mirrors when we
20 are wondering if we are going to have enough to drink
21 pretty soon? So I will be, hopefully, be able to submit
22 a few more comments before the day after New Year's.
23 Thank you very much.

24 MR. STOBAUGH: Thank you, Teri. And, again, I
25 just want to encourage you, as Christopher has done, if

1 you could provide whatever you have in writing. That
2 just helps us get with our accuracy. So, thank you very
3 much for your comments.

4 Next I have just again the next card up is
5 Edie Harmon. I'll ask you to state your name and who you
6 may represent and start with your public comments.

7 MS. HARMON: Edie Harmon. I'm from Ocotillo. At
8 this point I'm just representing myself. That may
9 change, but for right now.

10 I have a number of questions. I couldn't
11 find what I had typed up and had written, but I wanted to
12 let you know that I will be making a formal request that
13 you look under alternatives for considering an
14 alternative site, including the Mesquite Lake site in the
15 central part of Imperial County that is already
16 appropriately zoned land. And I have been here for more
17 than 30 years, and I have not seen development go in
18 there. And that is certainly the County's intent as to a
19 place where there should be industrial and commercial
20 development. And I will get pages and maps from the
21 County's General Plan to you on that.

22 As an alternative to the Mesquite Lake site,
23 I would request as a second alternative to consider other
24 lands that are already disturbed, whether it's lands that
25 have been used for agricultural projects, feed lots, or

1 failed construction projects, whatever, where we don't
2 have the same kind of significant biological and cultural
3 resources that exist on public lands that are managed by
4 BLM.

5 And I know there are areas that have been
6 disturbed and I know there are other areas that have
7 been -- when I looked at one of the BLM sites, it looked
8 to me like there were 65,000 acres of public lands that
9 were being proposed in Imperial County for solar projects
10 alone. That is an extraordinary amount of public land.
11 So the cumulative impacts would be very considerable.

12 And as a third alternative, other than sites
13 that we may additionally identify, as Teri said, we need
14 to look at in-base and rooftop solar. I know that there
15 have been a number of studies by engineers in San Diego
16 that indicate that Stirling Solar Two is not an essential
17 provider for San Diego Gas & Electric to be able to meet
18 the electrical needs of San Diego.

19 And having most recently read several books
20 on climate change and sea level rise, and all kinds of
21 things, water shortages, I think that the population of
22 San Diego and what happens in San Diego in the future may
23 be very different, especially with the reduction in
24 availability of water resources to support development in
25 the future. San Diego may rather than see a large

1 population increase may find that it's going to have to
2 have a population decrease because of climate change.
3 And that needs to be addressed, looking at information on
4 climate change, because some of the information I've seen
5 recently is quite shocking. And the time frames in which
6 these climate changes and water shortages may take place
7 are a lot shorter than we have been led to believe. So I
8 think that's an important concern.

9 Earlier it was mentioned by Stirling that --
10 representatives for Stirling -- that a single unit can
11 produce grid-ready electricity. If that's the case, I
12 ask that you look at an alternative of rather than
13 putting these units in concentrated area on public lands
14 to provide energy for San Diego Gas & Electric, that
15 there be looked at a dispersal of these units to provide
16 electricity for the State prisons that are located in
17 Imperial County where there is already disturbed land.
18 There are hospitals, there are schools, there are
19 shopping centers and malls, all of which have
20 considerable energy uses when combined.

21 So rather than having 30,000 units on 6,500
22 acres of relatively undisturbed land, the units could be
23 dispersed throughout Imperial County and provide energy
24 locally for IID or for high daytime energy consumption in
25 the county. And I think that's an alternative that has

1 to be considered. If we are talking about California
2 energy needs, we need not to talk about just the use of
3 public lands for providing, quote, profitable energy for
4 a distant source.

5 And at a pre-app meeting you mentioned
6 earlier that we were told that wasn't feasible because it
7 wouldn't be profitable. If we're talking about energy,
8 we need to take the profit issue out and look at who are
9 you producing energy for and where is that energy going,
10 not whether it's profitable. And if it's not profitable
11 to provide it for use locally, then maybe it's the wrong
12 project in the wrong place.

13 I would ask that visual resource issues be
14 consistent with BLM's VRM management site on the BLM web
15 site and that all of the visual inventory information be
16 available to the public at the BLM office in El Centro,
17 which is mandated by the BLM's VRM management guidelines
18 on the Internet. And there is some very specific
19 information, and BLM does not have the discretion to
20 reinterpret according to its guidelines that are on the
21 website.

22 And I would ask, also, if the planned
23 amendment is going to be done in similar -- in ways that
24 were similar to what BLM has done in the past, which is
25 putting out a plan amendment, with plan amendments rather

1 than a project -- a single project issue, BLM used to put
2 out draft plan amendments every year, or every couple of
3 years, and consider plan amendments for the entire CDCA
4 rather than just responding to a project. And I have
5 many of the plan amendments in the past, and they have
6 gone out, they have public comments, and sometimes it
7 takes a couple of years before BLM gets around to making
8 decisions.

9 And, again, as I asked before, where is the
10 funding coming from? When we were on the bus the last
11 time, we were told that it looked like there were going
12 to be requests for federally subsidized funding, you
13 know, federal funding and loans for this project. I
14 mean, I don't understand taxpayer subsidized things for
15 private profit. I have a problem if that's the way this
16 is going, is looking at taxpayer money on public lands
17 for private profit. Again, that's an issue that I think
18 has to be addressed.

19 And I would ask -- I have just looked at Dr.
20 Butler's comments on Stirling dish technology that were
21 submitted for the Sunrise Power Link Project, and it
22 looks as if there is still a problem with mean time
23 between failures and downtime on these units. And he
24 suggested that unless the mean time between failure is
25 substantially increased, that this is not viable

1 technology. And Dr. Butler is someone who has worked on
2 this technology before.

3 So I think that, you know, that the
4 reliability of the project needs to be addressed. And
5 when we were on the bus, again, we were told that the six
6 units that exist at Sandia, which is the only six units
7 in the world, were all handmade. So if we are going from
8 six handmade units that are in existence at Sandia
9 National Laboratory, which is at a much higher elevation
10 and much colder climate, and I was told by a friend who
11 just went there that things are more efficient, the solar
12 technology is more efficient at that climate and
13 elevation and temperature than it would be here, then we
14 need to look at how it compares. And if it's only
15 handmade units now, where it sounds like -- and we were
16 told on the bus that they would be looking for funding
17 for R&D, it looks like we're a long way away from
18 manufacturing thousands, tens of thousands of Stirling
19 Energy at some factory in Wisconsin -- I mean, not
20 Wisconsin, Michigan, which was unidentified, in the hopes
21 of producing the mirrors, the tens of thousands of
22 mirrors that are going to be someplace in Arizona. It
23 still sounds pretty iffy to me that we're not near having
24 units that are going to be reliable.

25 And I don't know if we have a fairly short

1 mean time between failure, which means a large
2 requirement for maintenance and potential problems with
3 the unit, if we don't have manufactured units how can we
4 say that this technology is going to be really reliable
5 and how much transportation is going to be involved to do
6 the maintenance and repairs in addition to the washing of
7 the mirrors. Because if it is still sort of an infant
8 technology, then we may need to look at potentially
9 increased emissions and impacts in terms of maintenance.
10 And I don't know. I haven't seen anything from Sandia
11 looking at what the current status -- unless you can tell
12 me -- what the current estimate of mean time between
13 failure on the units is, especially if you've only got
14 six units.

15 And my guess is on a lot of things if you are
16 doing them handmade or custom built, you can sort of
17 tweak out problems as you go, whereas if you start going
18 to factory manufactured units, there may be a longer
19 period of time to work out the bugs. I mean, goodness
20 only knows, Detroit has had enough problems with some of
21 the automobiles that have come out. And when I look at
22 the recall list in Consumer's Union, it's not exactly
23 something that inspires me to think that there is going
24 to be trouble-free if that's where Stirling Solar is
25 planning on getting its engines from.

1 And when I was briefly looking through the
2 documents this morning, it looked like there were some
3 fairly large scale engines and diesel operated engines
4 and facilities that would be on the project site and I
5 did not have time to ascertain what these diesel operated
6 energy and pumps would be.

7 I also have concerns with climate change
8 where, as I earlier mentioned, the pan evaporation rate
9 in Imperial County is over a hundred inches of water per
10 year. I don't know how the pan evaporation rates or
11 increased evaporation of water is likely to be with
12 increased winds and increased temperature. But,
13 certainly, the evaporation rate would be higher. And if
14 your water facilities are for waste water, I would think
15 that a higher evaporation rate might lead to a higher
16 accumulation of minerals of some types.

17 So I would ask that you need to look at
18 potential mitigation on here at covering anything so that
19 it's not going to be attractive to birds and it's also
20 not going to be attractive to other insects as an insect
21 breeding place.

22 We also need to look if you have water stored
23 on-site at reducing the possibility of tamarisk, or an
24 invasive species there, although I must admit from the
25 photographs it looked like from what you showed of the

1 photographs of Sandia was that the area had been scraped
2 -- or what your proposal for the area was, it looked like
3 it was without any vegetation at all. And I don't know
4 if that's the case because that would mean clearly that
5 the land has no use for anything else, the cultural and
6 archeological resource -- cultural values would be
7 destroyed, archeological resources would be destroyed.
8 And if there's no vegetation, there's no habitat for much
9 of anything. And --

10 MR. STOBAUGH: You have actually had your ten
11 minutes. Can I ask you if there is something you can --

12 MS. HARMON: One more question. I would like BLM
13 to consider this, the potential evaluation of this, as an
14 area of additional cultural concern in terms of working
15 together with Native Americans, just as you looked at the
16 area over by the Glamis Imperial Mine Project. I think
17 that's something that needs to be dealt with up front as
18 to whether that is an appropriate designation. And, if
19 so, then is it an appropriate project at that site.
20 Thank you.

21 MR. STOBAUGH: Thank you. Appreciate that.
22 Thank you. I have up next Donna Tisdale. And if you
23 would, come up and state your name and who you represent.

24 MS. TISDALE: Donna Tisdale, T-i-s-d-a-l-e. I'm
25 actually elected to represent the community of Boulevard

1 in the land use planning area, but I'm here today as an
2 individual.

3 And the Sunrise Power Link was mentioned
4 today and it was approved, but I wanted people here that
5 may not be aware that the assigned administrative law
6 judges for the Public Utilities Commission in their
7 proposed decision had found that the project was too
8 expensive, it was not needed, and it was too damaging
9 environmentally regardless of which route was chosen.

10 Well, today the southern route was chosen
11 without conditions for rural energy, and that route will
12 go right through the community of Boulevard.

13 Also, Mr. Egan's presentation was very -- it
14 sounded like Stirling Energy Systems was very magnanimous
15 in doing this out of the goodness of their heart, which I
16 really don't think is the actuality.

17 I do have a question that was raised at the
18 last meeting I was here and they talked about the
19 SunCatchers will fold up like sunflowers, although
20 sunflowers don't fold up, when the wind comes. And I
21 have not seen an anemometer on-site. And I was wondering
22 if there was going to be an anemometer on-site to
23 determine the types and frequencies of wind storms that
24 are involved that you will have to deal with, with these
25 fragile and expensive units.

1 I also want to bring up cumulative visual
2 impacts. Not only with the existing Southwest Power
3 Link, there will now be potential for the new Sunrise
4 Power Link and, also, the addition of the line back to
5 tap in for Stirling Solar to existing Imperial Valley
6 substation. But also on the simulation of all the 30,000
7 SunCatchers, the ridge to the west, I want people to be
8 aware that that is actually the target for Industrial
9 Wind Turbines in McCain Valley. There are over 130 of
10 them proposed at this moment. They're about 500 feet
11 tall, unless they go to three megawatts which is
12 approaching closer to 600 feet tall.

13 There is also the Wind Hunter Project to the
14 west here and there is also, I don't even know how many
15 projects proposed from the border south to the Sierra
16 Juarez Mountains, and that's also connected into the
17 Sunrise Power Link. There was a new party involved, a
18 new intervenor in the Sunrise Power Link Project, and
19 their name escapes me right now. It's another, I think,
20 Spanish company and they're talking about thousands of
21 megawatts of wind energy on the Sierra Juarez that they
22 want to tap into the Sunrise Power Link.

23 So that brings me also to another question.
24 Like Edie, I was on the bus tour on November 24th, the
25 site visit to the project site. And Mr. Lyden from

1 Stirling Solar had brought up that they just had the
2 equity funding for the pilot project and it was just for
3 the manufacturing. And actually they've got four other
4 handmade units that they are going to put into -- install
5 at Sandia to incorporate some changes in engineering for
6 mass production.

7 So they are still in the early phases here.
8 And he also at that point told us they were looking at
9 manufacturing projects -- the engines, back in Michigan,
10 I believe it was. But I saw an article in the Union
11 Tribute, San Diego Union recently, and they're talking
12 about Canadian. So there aren't that many jobs in Canada
13 that are American jobs. So these details need to be
14 worked out and vetted.

15 Also, I had another question on the -- Mr.
16 Lyden said it was going to cost a few million dollars in
17 substation upgrades but that Stirling Solar was number
18 one in line, the Cal-Iso line for the 300 megawatts, but
19 for Phase Two, they're number four in line. So if they
20 are number four in line to get into the expanded
21 substation for Sunrise Power Link, who's in front of them
22 and how many megawatts are involved and is there even
23 going to be any capacity on Sunrise Power Link or
24 Southwest Power Link for Phase Two?

25 These are important questions and I haven't

1 really heard these questions being asked, and I haven't
2 seen any information being provided on this. So I, too,
3 will try and submit my comments in writing. I would like
4 to say them publicly in case there is anybody listening,
5 it will maybe raise some awareness and, you know, spark
6 some curiosity and, hopefully, get some legitimate
7 responses.

8 MR. STOBAUGH: Thank you. I appreciate you kind
9 of reminding us -- I forgot to mention this to Ms.
10 Harmon, just follow up your comments in writing, again,
11 so we get the accuracy made well in that regard. So
12 thank you, Donna. I appreciate your comments.

13 I have up next, and tell me if I'm
14 mispronouncing this, Marilyn Moskowitz.

15 MS. MOSKOWITZ: Hi. I'm Marilyn Moskowitz. I'm
16 representing myself. I'm a -- well, I live in Holtville,
17 which is in Imperial County.

18 I'll try and be concise about this. Air
19 quality here tends to be very poor. The American Lung
20 Association I think on their last kind of report card,
21 Imperial County was doing very poorly. One of the points
22 they made was that 40 percent of our elementary school
23 children have asthma. On the coast it's 15 percent to 18
24 percent. So air quality is something I'm real concerned
25 about. I anticipate that a project of this magnitude

1 would, you know, issue forth quite of lot of dust and
2 other pollutants.

3 The other thing I'm concerned about is that
4 Ocotillo is served by an aquifer. Plaster City has
5 tapped into that. That was one of the designated water
6 suppliers of the project. And I think that would be a
7 bad call. I think that aquifer, considering it's good
8 quality water, which is rare in Imperial Valley really
9 needs to be preserved as drinking water, paying attention
10 to re-charge rates, et cetera, et cetera.

11 The other thing I want to talk about is
12 there's another paradigm for solar. The technology is
13 changing very, very rapidly. Southern California Edison
14 is having, I guess, they are planning to have a
15 250-megawatt project in terms of commercial rooftops.
16 Commercial rooftops, residential rooftops, are basically
17 there waiting. And the whole point is that, you know, we
18 are kind of waiting for the technology to make it really
19 feasible and it's around the corner.

20 So what that says to me, anyway, is at some
21 point if you go ahead with this kind of a project it's
22 going to be obsolete in a number of years. This is a
23 limited liability company, which means that once the
24 money is spent you can't go after the principals in terms
25 of cleanups, in terms of anything.

1 I think there needs to be a huge -- if it's
2 decided to go ahead with this project, there needs to be
3 is sufficient bond posted that's basically only for the
4 purpose of cleanup and restoration of this area. Because
5 Imperial County is a poor place. We are going to get
6 stuck. We're stuck with the new river. We're stuck with
7 the mess -- this whole area is stuck with the mess that
8 is going to be the Salton Sea or is becoming the Salton
9 Sea. We've got some environmental problems right now.
10 We don't need a huge 6,000- to 8,000-acre junkyard, you
11 know, of obsolete technology because I believe that the
12 solar technologies are changing fast enough with the thin
13 film PV, that sooner or later it is going to go
14 decentralized and localized, and then it's not going to
15 be feasible anymore, and where is the money going to come
16 from? So that's a real concern.

17 I think I'm just going to stay with those
18 things. But I think it's really important to realize
19 that there is this shifting paradigm in terms of PV from
20 huge mega stations to decentralized, localized, thin film
21 PV, and we kind of need to look at that. You know,
22 they're talking about 2014. The technology may have
23 innovated enough that the other paradigm is paramount at
24 that point. So I guess that's all. Thank you.

25 MR. STOBAUGH: Thank you. Okay. Unless anyone

1 else has signed up I have one more, Steve Taylor, to come
2 and speak. Steve, you represent San Diego Gas &
3 Electric?

4 MR. TAYLOR: Yes, I do.

5 MR. STOBAUGH: Okay.

6 MR. TAYLOR: My name is Steve Taylor. I work for
7 San Diego Gas & Electric. I'm here to support the
8 project, this project. And I would echo that this
9 project is being supported at the previous meeting that
10 we had here by numerous public agencies right here in the
11 valley. And I think it's very important to recognize
12 that there is a large amount of support in the community
13 for this project.

14 The Solar Two Project is a very important
15 part of SDG&E's strategy to meet its renewable goals into
16 the future, especially in light of the recent
17 announcement by Governor Schwarzenegger of increasing the
18 goal to 33 percent. This is something that will benefit
19 all Californians.

20 Today's approval by the California Public
21 Utilities Commission of the Sunrise Power Link is an
22 important first step in allowing the full build-out of
23 this project. We do encourage the agencies to meet their
24 NEPA and CEQA requirements. It's very important that
25 compliance is followed and that we follow the letter of

1 the law. I would also encourage the agencies to consider
2 expediting these projects based on Governor
3 Schwarzenegger's Executive Order because we need to move
4 forward with these types of projects in order to meet
5 these renewable goals.

6 With that, I say thank you very much.

7 MR. STOBAUGH: Thank you. I appreciate your
8 comments. I appreciate everyone's comments. That's the
9 five speakers I have had requested sign up. Is there
10 anybody else? Speak now or forever hold your peace. We
11 are going to turn it into an open house at this point in
12 time. You can mill around. Yes, Edie?

13 MS. HARMON: I would just like to add one more
14 comment. Edie Harmon. In response to the request that
15 you expedite, I think BLM has to follow the NEPA
16 requirements. You have to follow the timeline. You
17 cannot cut them short. There is nothing in any of the
18 directives of legislation that I have seen that
19 authorizes any Federal or State agency to circumvent the
20 NEPA or CEQA process by shortchanging the public's
21 opportunity to review and comment.

22 And I would add that when people talk about
23 expediting a project, remember that the project applicant
24 has had many months or years to come up with this. When
25 you come up with thousands of pages of documents and give

1 the public only a very short period of time to comment,
2 it's the public that gets cut out and it's the public
3 that has to deal with -- live with the consequences, both
4 financially and environmentally and in terms of health
5 with the kinds of decisions that are being made.

6 So I would urge you not to even consider
7 shortchanging in speeding up the process. In fact, if
8 anything, give us more time because there is so much to
9 look at.

10 MR. STOBAUGH: Okay. Right now we will consider
11 those comments offered in this public arena, okay? No
12 position established one way or the other. But that is
13 the purpose of public scoping is to simply provide and
14 solicit, if you would, an opportunity for the public to
15 come forward at this time and offer us their thoughts on
16 whatever issues, potential impacts they may see, possible
17 alternatives. That is exactly what the scoping purpose
18 is. And right now I think it's the system and the
19 processes are all working.

20 MS. HARMON: Can we send scanned documents if we
21 don't --

22 MR. STOBAUGH: If you, for example, under scanned
23 documents a pdf, BLM as well I'm sure the California
24 Energy Commission can receive those.

25 MS. HARMON: I have some exhibits that I would

1 like to be able to send you, but I don't have anything
2 other than something -- I could scan it, but I don't have
3 it on the computer and I realize from having to scan
4 20,000 pages of documents, scanned documents take up a
5 lot of space. So is it okay if I can't or would you
6 rather have paper copies if I can't -- if I don't have it
7 on --

8 MR. STOBAUGH: We would ask for you to submit it
9 in whatever form you can submit it in that regard. We
10 can look at making copies, if you would, from what we
11 have received. But it's the manner you wish us to
12 receive it in.

13 MS. HARMON: I can send some things scanned as
14 exhibits, but being aware that they take up many, many
15 times the amount of computer space.

16 MR. STOBAUGH: Right.

17 MS. HARMON: Okay, thank you.

18 MR. STOBAUGH: That's all we have. It's roughly
19 about 20 minutes -- well, actually, about 15 minutes
20 left. But as far as the full scoping meeting, it runs to
21 7:00 p.m. as we advertised. I encourage folks to again
22 walk around and take a look at what these placards show
23 us. There are other pieces of information around as
24 well. And I want to thank the folks coming here and
25 participating in this, the Applicant, of course, Stirling

1 Energy folks here, providing us with the input so we get
2 a better idea what we are scoping on, and the California
3 Energy Commission with helping us walk through this
4 process together.

5 Again, I appreciate the public's interest in
6 this project. One of the reasons why this second scoping
7 meeting was held at this hour, 5:00 to 7:00, was to
8 provide those an after-work time to come and speak as
9 well. The last one was held in the afternoon at 2:00 in
10 the afternoon. So we wanted to make sure we have the
11 opportunity for those working as well as those that
12 couldn't get off work providing an opportunity.

13 So if there's nothing else, thank you very
14 much. Again, I will be here until 7:00 p.m. as well so
15 I'm not going to obligate anyone else to be here until
16 7:00 p.m. So it's up to you at this point in time.
17 Thank you.

18 (End of proceeding at 6:34 p.m.)

Subject: Notice of Intent to Prepare an Environmental Impact Statement/Staff Assessment and Proposed Land Use Plan Amendment for the SES Solar Two project, Imperial County, CA

Dear Mr. Meyer:

The U.S. Environmental Protection Agency (EPA) has reviewed the October 17, 2008 Notice of Intent (NOI) to prepare an Environmental Impact Statement (EIS)/Staff Assessment for the Stirling Energy Systems (SES) Solar Two Project in Imperial County, California. Our comments are provided pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508), and our NEPA review authority under Section 309 of the Clean Air Act.

EPA supports increasing the development of renewable energy resources, as recommended in the National Energy Policy. Using renewable energy resources such as solar power can help the nation meet its energy requirements without generating greenhouse gas emissions. To assist in the scoping process for the project, we have identified several issues for your attention in the preparation of the EIS. These issues are discussed in our detailed comments.

We appreciate the opportunity to review this NOI and are available to discuss our comments. Please send one hard copy of the Draft EIS and two CD ROM copies to this office at the same time it is officially filed with our Washington D.C. Office. If you have any questions, please contact me at (415) 972-3545 or at mcpherson.ann@epa.gov.

Sincerely,

Ann McPherson
Environmental Review Office

Enclosures: Detailed Comments

cc: Lynda Kastoll, Bureau of Land Management

US EPA DETAILED COMMENTS ON THE SCOPING NOTICE FOR THE ENVIRONMENTAL IMPACT STATEMENT (EIS)/STAFF ASSESSMENT AND PROPOSED LAND USE PLAN AMENDMENT FOR THE PROPOSED STIRLING ENERGY SYSTEM (SES) SOLAR TWO PROJECT, IMPERIAL COUNTY, CALIFORNIA, NOVEMBER 14, 2008

Project Description

The Stirling Energy System (SES) Solar Two Project would consist of a solar thermal power plant facility approximately 14 miles west of El Centro, California in Imperial County. The proposed project would be constructed in two phases utilizing SunCatcher technology, and would include approximately 30,000 250 kilowatt (kw) solar power dishes with a generating capacity of approximately 750 megawatts (MW). The first phase would consist of up to 12,000 SunCatchers configured in arrays of 200 1.5 MW solar groups (60 SunCatchers/1.5 MW group) with a generating capacity of about 300 MW. The second phase would consist of approximately 18,000 SunCatchers configured in 500 1.5 MW groups (60 SunCatchers/1.5 MW group) with a net generating capacity of 450 MW. Each SunCatcher system consists of a 38x40 foot wide solar concentrator dish that supports an array of curved glass mirror facets designed to automatically track the sun and focus solar energy onto a Power Conversion Unit which generates electricity. Related structures include a main services complex, assembly buildings, a 230-kilovolts (kV) electrical substation, a 10-mile transmission line, access roads, supply water line, and a 10-mile 230kV transmission line from the project site to the existing substation. The project would be located on approximately 6,500 acres of land, including 6,140 acres of BLM-administered public land and approximately 360 acres of privately owned land.

1. Statement of Purpose and Need

The Draft Environmental Impact Statement (DEIS) should clearly identify the underlying purpose and need to which the Bureau of Land Management (BLM) is responding in proposing the alternatives (40 CFR 1502.13). The *purpose* of the proposed action is typically the specific objectives of the activity, while the *need* for the proposed action may be to eliminate a broader underlying problem or take advantage of an opportunity.

Recommendation:

The purpose and need should be a clear, objective statement of the rationale for the proposed project. The DEIS should discuss the proposed project in the context of the larger energy market that this project would serve; identify potential purchasers of the power produced; and discuss how the project will assist the state in meeting its renewable energy portfolio standards and goals.

2. Alternatives Analysis

EPA urges a creative and flexible approach be taken in the development of potential alternatives. Note that the National Environmental Policy Act (NEPA) requires evaluation of reasonable alternatives, including those that may not be within the jurisdiction of the lead agency (40 CFR Section 1502.14(c)). A robust range of alternatives will include options for avoiding significant environmental impacts. The DEIS should provide a clear discussion of the reasons for

the elimination of alternatives which are not evaluated in detail. Reasonable alternatives should include, but are not necessarily limited to, alternative sites, capacities, and technologies as well as alternatives that identify environmentally sensitive areas or areas with potential use conflicts. The alternatives analysis should describe the approach used to identify environmentally sensitive areas and describe the process that was used to designate them in terms of sensitivity (low, medium, and high).

The environmental impacts of the proposal and alternatives should be presented in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision maker and the public (40 CFR 1502.14). The potential environmental impacts of each alternative should be quantified to the greatest extent possible (e.g., acres of wetlands impacted, tons per year of emissions produced, etc.).

Recommendation:

The DEIS should describe how each alternative was developed, how it addresses each project objective, and how it will be implemented. The DEIS should clearly describe the rationale used to determine whether impacts of an alternative are significant or not. Thresholds of significance should be determined by considering the context and intensity of an action and its effects (40 CFR 1508.27).

3. Biological Resources

The DEIS should identify all petitioned and listed threatened and endangered species and critical habitat that might occur within the project area. The document should identify and quantify which species or critical habitat might be directly, indirectly, or cumulatively affected by each alternative and mitigate impacts to these species. Emphasis should be placed on the protection and recovery of species due to their status or potential status under the Endangered Species Act (ESA). We recommend that the DEIS include a biological assessment, as well as a description of the outcome of consultation with the U.S. Fish and Wildlife Service under Section 7 of the ESA. Analysis of impacts and mitigation on covered species should include:

- Baseline conditions of habitats and populations of the covered species;
- A clear description of how avoidance, mitigation and conservation measures will protect and encourage the recovery of the covered species and their habitats in the project area;
- Monitoring, reporting and adaptive management efforts to ensure species and habitat conservation effectiveness.

The DEIS should indicate what measures will be taken to protect important wildlife habitat areas from potential adverse effects of proposed covered activities. We encourage habitat conservation alternatives that avoid and protect high value habitat and create or preserve linkages between habitat areas to better conserve the covered species.

4. Air Quality

The DEIS should provide a detailed discussion of ambient air conditions (baseline or existing conditions), National Ambient Air Quality Standards (NAAQS), criteria pollutant nonattainment areas, and potential air quality impacts of the proposed project (including cumulative and indirect impacts). Such an evaluation is necessary to assure compliance with State and Federal air quality regulations, and to disclose the potential impacts from temporary or cumulative degradation of air quality.

The DEIS should describe and estimate air emissions from potential construction and maintenance activities, as well as proposed mitigation measures to minimize those emissions. EPA recommends an evaluation of the following measures to reduce emissions of criteria air pollutants and hazardous air pollutants (air toxics).

Recommendations:

- *Existing Conditions* – The DEIS should provide a detailed discussion of ambient air conditions, NAAQS, and criteria pollutant nonattainment areas in all areas considered for solar development.
- *Quantify Emissions* – The DEIS should estimate emissions of criteria pollutants from the proposed project and discuss the timeframe for release of these emissions over the lifespan of the project. The DEIS should describe and estimate emissions from potential construction activities, as well as proposed mitigation measures to minimize these emissions.
- *Specify Emission Sources* – The DEIS should specify the emission sources by pollutant from mobile sources, stationary sources, and ground disturbance. This source specific information should be used to identify appropriate mitigation measures and areas in need of the greatest attention.
- *Equipment Emissions Mitigation Plan (EEMP)* – The DEIS should identify the need for an EEMP. An EEMP will identify actions to reduce diesel particulate, carbon monoxide, hydrocarbons, and NO_x associated with construction activities. We recommend that the EEMP require that all construction-related engines:
 - are tuned to the engine manufacturer's specification in accordance with an appropriate time frame;
 - do not idle for more than five minutes (unless, in the case of certain drilling engines, it is necessary for the operating scope);
 - are not tampered with in order to increase engine horsepower;
 - include particulate traps, oxidation catalysts and other suitable control devices on all construction equipment used at the project site;
 - use diesel fuel having a sulfur content of 15 parts per million or less, or other suitable alternative diesel fuel, unless such fuel cannot be reasonably procured in the market area; and

○ include control devices to reduce air emissions. The determination of which equipment is suitable for control devices should be made by an independent Licensed Mechanical Engineer. Equipment suitable for control devices may include drilling equipment, generators, compressors, graders, bulldozers, and dump trucks.

- *Fugitive Dust Control Plan* - The DEIS should identify the need for *Fugitive Dust Control Plan*. We offer these general recommendations:

- Stabilize open storage piles and by covering and/or applying water or chemical/organic dust palliative where appropriate. This applies to both inactive and active sites, during workdays, weekends, holidays, and windy conditions.
- Install wind fencing and phase grading operations where appropriate, and operate water trucks for stabilization of surfaces under windy conditions; and
- When hauling material and operating non-earthmoving equipment, prevent spillage and limit speeds to 15 miles per hour (mph). Limit speed of earth-moving equipment to 10 mph.

5. Climate Change

Scientific evidence supports the concern that continued increases in greenhouse gas emissions resulting from human activities will contribute to climate change. Global warming is caused by emissions of carbon dioxide and other heat-trapping gases. Global warming can affect weather patterns, sea level, ocean acidification, chemical reaction rates, and precipitation rates, resulting in climate change.

Recommendation:

We recommend the DEIS include a discussion of climate change and how climate change could potentially influence the proposed project, especially within sensitive areas. We recommend this discussion include a short summary of any applicable climate change studies, including their findings on potential environmental impacts and their recommendations for addressing these effects.

Recommendation:

We recommend the DEIS quantify and disclose the anticipated climate change *benefits* of solar energy. We suggest quantifying greenhouse gas emissions from different types of generating facilities including solar, geothermal, natural gas, coal-burning, and nuclear and compiling and comparing these values.

6. Indirect and Cumulative Impacts

The cumulative impacts analysis should provide the context for understanding the magnitude of the impacts of the alternatives by analyzing the impacts of other past, present, and reasonably foreseeable projects or actions and then considering those cumulative impacts in their

entirety (CEQ's Forty Questions, #18). The DEIS should clearly identify the resources that may be cumulatively impacted, the time over which impacts are going to occur, and the geographic area that will be impacted by the proposed project. The DEIS should focus on resources of concern—those resources that are “at risk” and/or are significantly impacted by the proposed project, before mitigation. In the introduction to the *Cumulative Impacts Section*, identify which resources are analyzed, which ones are not, and why. For each resource analyzed, the DEIS should:

- Identify the current condition of the resource as a measure of past impacts. For example, the percentage of species habitat lost to date.
- Identify the trend in the condition of the resource as a measure of present impacts. For example, the health of the resource is improving, declining, or in stasis.
- Identify all on-going, planned, and reasonably foreseeable projects in the study area that may contribute to cumulative impacts.
- Identify the future condition of the resource based on an analysis of impacts from reasonably foreseeable projects or actions added to existing conditions and current trends.
- Assess the cumulative impacts contribution of the proposed alternatives to the long-term health of the resource, and provide a specific measure for the projected impact from the proposed alternatives.
- Disclose the parties that would be responsible for avoiding, minimizing, and mitigating those adverse impacts.
- Identify opportunities to avoid and minimize impacts, including working with other entities.

7.2 Water Resources

Water Supply and Water Quality

The DEIS should estimate the quantity of water the project will require and describe the source of this water and potential effects on other water users and natural resources in the project's area of influence. Assuming groundwater is used, the DEIS should clearly depict reasonably foreseeable direct, indirect and cumulative impacts to this resource. Specifically, the potentially-affected groundwater basin should be identified and any potential for subsidence and impacts to springs or other open water bodies and biologic resources should be analyzed. At a minimum, the DEIS should include:

- An analysis of the potential for alternatives to cause adverse aquatic impacts such as impacts to water quality and aquatic habitats;
- A discussion of compliance with Clean Water Act Section 404(b)(1) Guidelines (40 CFR 230) if alternatives propose to place fill in waters of the U.S. (WOUS);
- A detailed discussion of cumulative impacts to groundwater supply within the hydrographic basins that would support the alternatives; and
- A description of the water right permitting process, including whether water right permits contain special conditions; measures to mitigate direct, indirect, and cumulative impacts; and provisions for monitoring and adaptive management.

The DEIS should address the potential effects of project discharges, if any, on surface water quality. The specific discharges should be identified and potential effects of discharges on designated beneficial uses of affected waters should be analyzed. If the facility is a zero-discharge facility, the DEIS should disclose the amount of process water that would be disposed of onsite and explain methods of onsite containment. The DEIS should describe the original (natural) drainage patterns in the project locale, as well as the drainage patterns of the area during project operations, and identify whether any components of the proposed project are within a 50 or 100-year floodplain. We also recommend the DEIS include information on the functions and locations of ephemeral washes in the project area, because of the important hydrologic and biogeochemical role these washes play in direct relationship to higher-order waters downstream.

Clean Water Act Section 404

The project applicant should coordinate with the U.S. Army Corps of Engineers to determine if the proposed project requires a Section 404 permit under the Clean Water Act. Section 404 regulates the discharge of dredged or fill material into waters of the United States (WOUS), including wetlands and other *special aquatic sites*. The DEIS should describe all WOUS that could be affected by the project alternatives, and include maps that clearly identify all waters within the project area. The discussion should include acreages and channel lengths, habitat types, values, and functions of these waters. If a permit is required, EPA will review the project for compliance with *Federal Guidelines for Specification of Disposal Sites for Dredged or Fill Materials* (40 CFR 230), promulgated pursuant to Section 404(b)(1) of the CWA (“404(b)(1) Guidelines”). Pursuant to 40 CFR 230, any permitted discharge into WOUS must be the least environmentally damaging practicable alternative (LEDPA) available to achieve the project purpose.

Clean Water Act Section 303(d)

The CWA requires States to develop a list of impaired waters that do not meet water quality standards, establish priority rankings, and develop action plans, called Total Maximum Daily Loads (TMDLs), to improve water quality. The DEIS should provide information on CWA Section 303(d) impaired waters in the project area, if any, and efforts to develop and revise TMDLs.

8. Coordination with Tribal Governments

Executive Order 13175

Executive Order 13175, *Consultation and Coordination with Indian Tribal Governments* (November 6, 2000), was issued in order to establish regular and meaningful consultation and collaboration with tribal officials in the development of federal policies that have tribal implications, and to strengthen the United States government-to-government relationships with Indian tribes.

Recommendation:

We recommend the DEIS describe the process and outcome of government-to-government consultation between the BLM and each of the tribal governments within the project area, issues that were raised (if any), and how those issues were addressed in the selection of the proposed alternative.

National Historic Preservation Act and Executive Order 13007

Consultation for tribal cultural resources is required under Section 106 of the National Historic Preservation Act (NHPA). Historic properties under the National Historic Preservation Act (NHPA) are properties that are included in the National Register of Historic Places (NRHP) or that meet the criteria for the National Register. Section 106 of the NHPA requires a federal agency, upon determining that activities under its control could affect historic properties, consult with the appropriate State Historic Preservation Officer/Tribal Historic Preservation Officer (SHPO/THPO). Under NEPA, any impacts to tribal, cultural, or other treaty resources must be discussed and mitigated. Section 106 of the NHPA requires that Federal agencies consider the effects of their actions on cultural resources, following regulation in 36 CFR 800.

Executive Order 13007, *Indian Sacred Sites* (May 24, 1996), requires federal land managing agencies to accommodate access to, and ceremonial use of, Indian sacred sites by Indian Religious practitioners, and to avoid adversely affecting the physical integrity of such sacred sites. It is important to note that a sacred site may not meet the National Register criteria for a historic property and that, conversely, a historic property may not meet the criteria for a sacred site.

Recommendation:

The DEIS should address the existence of Indian sacred sites in the project area and discuss how the BLM will avoid adversely affecting the physical integrity of sacred sites, if they exist. The DEIS should provide a summary of all coordination with Tribes and with the SHPO/THPO, including identification of NRHP eligible sites; and development of a Cultural Resource Management Plan.

9. Environmental Justice

Executive Order 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations* (February 11, 1994), directs federal agencies to identify and address disproportionately high and adverse human health or environmental effects on minority and low-income populations, allowing those populations a meaningful opportunity to participate in the decision-making process. Guidance¹ by CEQ clarifies the terms low-income and minority population (which includes American Indians) and describes the factors to consider when evaluating disproportionately high and adverse human health effects.

¹Environmental Justice Guidance under the National Environmental Policy Act, Appendix A (Guidance for Federal Agencies on Key Terms in Executive Order 12898), CEQ, December 10, 1997.

Recommendation:

The DEIS should include an evaluation of environmental justice populations within the geographic scope of the project. If such populations exist, the DEIS should address the potential for disproportionate adverse impacts to minority and low-income populations, and the approaches used to foster public participation by these populations. Assessment of the project's impact on minority and low-income populations should reflect coordination with those affected populations.

10. Recreational Use

BLM is entrusted with the multiple-use management of natural resources on public land, and that public land must be managed for outdoor recreation and natural, scenic, scientific, and historical values. The development of solar resources could restrict or reduce the opportunities for recreational use, including off-highway vehicles (OHV) that may access areas that may have been designated as open for recreational use.

Recommendation:

EPA recommends that there be full disclosure of the impacts to recreational users in the project area. The DEIS should clarify what general measures will be incorporated to ensure that OHV and other recreational users are not injured due to hazards associated with exposed solar collectors, piping, and transmission lines. It would be reasonable to assume that OHV users do not always stay on designated trails or may not know which trails are in fact designated. Some precautions regarding safety should be implemented.

11. Invasive Species

Executive Order 13112, *Invasive Species* (February 3, 1999), mandates that federal agencies take actions to prevent the introduction of invasive species, provide for their control, and minimize the economic, ecological, and human health impacts that invasive species cause. The DEIS should include a project design feature that calls for the development of an invasive plant management plan to monitor and control noxious weeds. Executive Order 13112 also calls for the restoration of native plants and tree species. If the proposed project will entail new landscaping, the DEIS should describe how the project will meet the requirements of Executive Order 13112.

12. Hazardous Materials and Hazardous Waste

The DEIS should address potential direct, indirect and cumulative impacts of hazardous waste from construction and operation. The document should identify projected hazardous waste types and volumes, and expected storage, disposal, and management plans. It should address the applicability of state and federal hazardous waste requirements. Appropriate mitigation should be evaluated, including measures to minimize the generation of hazardous waste (i.e., hazardous waste minimization). Alternate industrial processes using less toxic materials should be

evaluated as mitigation. This potentially reduces the volume or toxicity of hazardous materials requiring management and disposal as hazardous waste.

13. Coordination with Land Use Planning Activities

The DEIS should discuss how the proposed action would support or conflict with the objectives of federal, state, tribal or local land use plans, policies and controls in the project area. The term "land use plans" includes all types of formally adopted documents for land use planning, conservation, zoning and related regulatory requirements. Proposed plans not yet developed should also be addressed if they have been formally proposed by the appropriate government body in a written form (CEQ's Forty Questions, #23b).

**John Pierre Menvielle's Prepared Remarks
November 24, 2008**

DOCKET
08-AFC-5

Good afternoon, I am John Pierre Menvielle, president of the Imperial Irrigation District Board of Directors, and I am here to speak in favor of the Stirling Energy Systems solar project in the Imperial Valley.

IID is the third largest public power provider in the state of California and is a staunch supporter of the development of renewable energy resources within its service area. We view projects like this one as being essential to spurring the growth and development of this emerging segment of the regional economy, and the district has committed its own resources to upgrading its transmission system to promote that growth and development in the coming years.

As an energy balancing authority, we applaud Stirling's innovative technology; as an irrigation district, we are greatly encouraged by the efficiency measures it will employ to conserve water.

And, as a leading public sector employer and corporate citizen with an obvious stake in the economic progress of the communities we serve, we look forward to the hundreds of jobs the company will create in the future.

If IID can be of any further assistance in moving this project forward through the scoping process, you may be assured that we stand ready to do so.

Thank you.

Proposed SES Solar Two Power Project 11/24/08

The El Centro Chamber of Commerce and Visitors Bureau is on record with a policy statement that says in part:

- * We support policies that encourage the generation of additional local energy , including production of renewable energy resources for export and local consumption , provided that renewable energy projects are consistant with land use policies and environmental impacts are fully mitigated.

Additionally , The El Centro Chamber of Commerce supports projects that will be beneficial to the local economy. The SES Solar Two project as proposed , will create a significant number of construction jobs. With the completion of the project an estimated 200 permanent jobs will have been created. Stirling Energy Systems Solar Two Project should be a key part of Imperial County's goal of becoming the leader in "Green Energy " production not only in California but in the world. Solar , wind and geothermal energy development are all available within this county and plans are already underway to provide the means to transfer this electricity to other parts of the state, additionally, programs have been developed with in the county to provide the skilled workforce for these facilities.

The El Centro Chamber of Commerce supports Stirling Energy Systems Solar Two Project as stated in the Policy Statement.

Re: Stirling Two Scoping Comments

Dear Mr. Meyer,

On behalf of the Desert Protective Council, I would like to submit these scoping comments for your consideration as an addition to the verbal comments I made in person at the December 18 2008 El Centro Public Scoping meeting.

The Desert Protective Council (DPC) is a 54-year-old non-profit membership organization whose mission is to preserve the unique natural, cultural, historic, recreational, scientific and visual resources of the American southwest deserts; and to educate children and adults to the wonder of the deserts.

The DPC represents members in San Diego and Imperial Counties who are knowledgeable about the area of BLM public lands in western Imperial County on which this proposed Solar Two project is located. We are concerned about the potential mitigable and immittigable impacts from this massive project.

- Cultural Resource Impacts- complete surveys of cultural artifacts, sites and areas within the project area are needed. Archaeologists who have experience in the Imperial County area should be employed. Consultation with local Native American Tribes, including representatives of the Quechan and Kumeyyay Tribes should be done as well as consultation with the Native American Lands Conservancy. Cumulative impacts to the cultural heritage of the entire Yuha Desert Cultural area must be analyzed. Local archaeologist Jay Von Werlhof of Ocotillo should be consulted as well as Russell Kaldenburg.
- Land Use Impacts- the loss of 6,500 acres of public land to other uses must be analyzed in the context of cumulative losses of Imperial County public land to other energy-development-related projects, including the loss of land to proposed transmission lines

- Impacts to sensitive plant and animal species- surveys of the Flat-Tailed Horned Lizard must be conducted during the summer months and surveys of burrowing owls must be conducted during the appropriate season as well so as not to disturb the nesting activities.
 - Efforts to relocate burrowing owl nests have been met with limited success- this is impact must be considered.
- Impacts to Soils- The scraping of the desert for construction roads will not only cause soils to become airborne, it will also allow for introduction of invasive non-native plants such as Brassica tournefortii. Watering the soil during springtime construction, will also promote the propagation and proliferation of this deadly plant. How will the germination and propagation of this deadly, prolific non-native plant be prevented?
 - The scraping of the ground for 500 or so miles of roads has the potential for obliterating habitat for the sensitive and rare plant and animal species
- Imperial County is in non-attainment for particulates (PM10) and for ozone. How will the developers of this project prevent additional particulates from vehicles being added to the already impaired air quality during construction and during operations?
- The Ocotillo/Nomirage aquifer is a sole-source federally protected aquifer and must not be employed for industrial uses. The Colorado River is already over-allocated. This is an issue that must be thoroughly vetted with all appropriate agencies. What will be the impacts of taking water from an already hard-pressed source?
- Impacts to the Community Character of the Ocotillo/Nomirage communities, including impacts to dark skies and quiet must be addressed. How will this affect property values as well as the impairment of the desert character which many folks moved there to enjoy?
- Impacts to the air space must be analyzed. What kind of glare will the Sun Catchers send into the flight paths above the proposed project area?
- Impacts to the recreational quality and experience of nearby Plaster City Open Area, the Superstition Hills recreation area and to Painted Gorge Recreation Area must be analyzed.
- Impacts to the resources and recreational experience of Anza-Borrego Desert State Park must be analyzed.

There are many more issues involved in this massive solar project that the Desert Protective Council does not have the expertise to address, but we are confident that the Project managers, the CEC and the BLM have taken pains to inform all possible concerned agencies, local citizens, Anza-Borrego State Park officials, wildlife biologists and soil scientists of this project in order to receive the most complete list of issues possible.

Thank you very much for this opportunity to comment and participate in the public process for the Stirling Energy Systems Solar Two project.

Happy New Year!

Sincerely,

Terry Weiner

Jim Stobaugh, Project Manager
Bureau of Land Management

Christopher Meyer, Project Manager
California Energy Commission

Re: Scoping comments on the Stirling Energy Systems Solar Two Project

Dear Mr. Stobaugh and Mr. Meyer,

Please accept and fully consider these comments on the Stirling Energy Systems Solar Two Project (SES Solar Two) on behalf of The Wilderness Society and the Natural Resources Defense Council (NRDC).

The Wilderness Society has worked for more than 70 years to maintain the integrity of America's wilderness and public lands and the biodiversity these lands support. With over 300,000 members and supporters nation-wide, TWS represents a diverse range of citizens. Our goal at TWS is to protect public lands as wilderness and to ensure that land management practices are sustainable and based on sound science to ensure that the ecological integrity of the land is maintained.

NRDC is a non-profit environmental organization with over 650,000 members nationwide. NRDC uses law, science and the support of its members and activists to protect the planet's wildlife and wild places and to ensure a safe and healthy environment for all living things. NRDC has worked to protect wildlands and natural values on public lands for many years.

It is clear that the nation's growing addiction to fossil fuels, coupled with the unprecedented threats brought about by global warming, imperil the integrity of our wildlands as never before. To sustain both our wildlands and our human communities, we need to transition away from fossil fuels. Our public lands harbor substantial wind, solar, and geothermal resources. Developing some of these resources will be important to creating a sustainable energy economy and combating climate change, and The Wilderness Society and NRDC support such responsible development of renewable energy. Renewable resource development is not appropriate everywhere on the public lands, however, and development that does occur on the public lands should take place in a responsible manner.

As the Bureau of Land Management (BLM) processes applications for solar development on public lands, they should continue to improve the process, including incorporating additional Best Management Practices (BMPs), refining their Right of Way (ROW) application process to properly address the differences between solar development and other uses of ROWs, and incorporating recommendations from ongoing transmission

planning. In general, BLM should prioritize development on already disturbed lands which are close to existing transmission and do not contain significant other values and resources.

The scoping comments below are organized under two topics: the relative suitability of the proposed site for a large-scale commercial solar energy development, and the specific issues pertaining to the SES Solar Two proposal and the SunCatcher technology.

I. RELATIVE SUITABILITY OF PROJECT PROPOSAL SITE

Based on the information gathered to date, the SES Solar Two site appears to have potential for developing commercial scale solar energy with fewer impacts to other resources than some other areas with high solar potential managed by the BLM. The absence of sensitive and protected areas such as Areas of Critical Environmental Concern and Citizens' Proposed Wilderness, the relatively limited use of the site for other activities such as recreation, the limited number of sensitive wildlife species in the area, and the presence of existing transmission to support Phase I of the project all contribute to the possibility that development of a commercial scale solar facility on this site could result in an overall benefit to the public lands and the American people who own them.

However, any industrial use of our public lands entails impacts, and development of a commercial scale solar energy facility would exclude all other uses of these lands. Because of the intensive nature of such development, in general we urge the BLM to prioritize permitting solar energy developments on already disturbed lands which are close to existing transmission and do not contain other resources and values which would be impacted by development. The undisturbed nature of the SES Solar Two project site requires further study to ensure that other values will not be unacceptably impacted, as well as careful consideration of other alternative sites that might be better for the proposed purpose. In addition, special care must be taken to ensure that any unavoidable impacts to other resources and values in the project area are minimized and mitigated.

A. Cultural Resources

The California Energy Commission's (CEC) Issues Identification Report (IIR) identifies cultural resources as a technical subject area where critical or significant issues have been identified. The IIR states that,

“Due to the undisturbed nature of the area, the extremely high frequency of identified cultural resources on or adjacent to the proposed project site, and the potential for unidentified cultural resources sites, the BLM and Energy Commission staff are engaged in developing resolutions to the impacts that the proposed SES Solar Two Project would have on cultural resources. It is the intent of the BLM and Energy Commission to gather the additional information necessary to construct an adequate picture of the cultural environment of the project area, and to enable the BLM and the Energy Commission to formulate substantive resolutions to the issues identified.” (IIR p. 6)

With 254 known archaeological sites in the project area (IIR p. 6), we are encouraged that the agencies have identified the study and protection of cultural resources as a priority, and recommend the ongoing commitment to protection of these resources.

Recommendation: The BLM should prioritize protection of the area's outstanding cultural resources, including study of the area's resources, development of strategies to minimize and mitigate impacts, and ongoing engagement in consultation with local Native American tribes.

B. Biological Resources

The project applicant's Response to CEC and BLM Data Requests 1-52 Set 1, Part 1 (Data Response) states that potential impacts to burrowing owl habitat and flat-tailed horned lizards may occur (Data Request p. BIO-4). The Data Response outlines steps to be taken to reduce impacts to these species, including a proposed translocation program for flat-tailed horned lizards and preconstruction surveys for burrowing owls. These and other steps to protect these and other species in the area will be important to minimize impacts of the proposed development.

Recommendation: The agencies should prioritize protection of species in the project proposal area by further analyzing potential impacts and developing Best Management Practices and steps to minimize and mitigate any unavoidable impacts.

C. Water

Water is a limited resource in the desert southwest, and any project proposal should fully analyze the water needs and identify sources to meet those needs. The IIR states that the SES Solar Two project would require a total of approximately 32.7 acre-feet of raw water per year (IIR p. 3). The IIR further states that water for the project would be provided by the Imperial Irrigation District (IID) via the existing Westside Main Canal. However, in response to a request for detailed information regarding the reliability of the IID for providing the required water, the Data Response simply states that the applicant submitted a letter for additional time to respond to this data request. It is critical that this information be gathered before the ROW is granted.

Recommendation: The agencies should gather additional information to confirm that the water needed for the SES Solar Two project will be available as well as that the source of the needed water will conform to existing CEC policy.

II. ISSUES SPECIFIC TO SES SOLAR TWO PROPOSAL AND SUNCATCHER TECHNOLOGY

The SES Solar Two proposal and SunCatcher technology include promising elements, including high thermal efficiency and relatively low water use compared to other power generation sources. However, there are some issues that the agencies should analyze

further in the development of their Preliminary Staff Assessment/Draft Environmental Impact Statement.

The SunCatcher technology has been successfully demonstrated in a prototype six dish model power plant at the Solar Thermal Test Facility at Sandia National Laboratory in New Mexico. This model power plant set a new record for solar-to-grid conversion efficiency in February, 2008 with a 31.25 percent efficiency rate. However, SunCatcher technology has never been produced at commercial scale, and it remains to be seen what technological and economic challenges will face the buildout of 30,000 units proposed for the SES Solar Two project.

Because this technology has not been developed at a commercial scale, and based on the need for additional information regarding certain elements of the technology and project proposal, the agencies should consider the issues below.

A. Phased Development

1. Limiting development to areas with viable transmission

The SES Solar Two project proposal consists of two phases. Phase I would consist of 12,000 SunCatchers, with a nominal generating capacity of 300 MW and requiring approximately 2,600 acres. Other than the construction of a new 230-kV substation and a 10.3-mile, double-circuit, 230-kV interconnection transmission line, no new transmission lines or off-site substations would be required for the 300-MW Phase I construction.

Phase II would consist of 18,000 additional SunCatchers with a nominal generating capacity of 450 MW and requiring approximately 3,500 acres. Phase II of the project is dependent on the approval and construction of the 500-kV Sunrise Powerlink transmission line project proposed by San Diego Gas and Electric. Although the Sunrise project was recently approved by the California Public Utility Commission, that approval was highly controversial and may be the subject of litigation. Accordingly, serious questions remain as to whether and if so when this transmission line will be constructed, making the granting of a ROW for the Phase II project area premature.

Recommendation: Because of the uncertainty regarding the approval and construction of the Sunrise Powerlink, BLM should consider only granting a ROW for the Phase I project area until such time that the approval of the Sunrise Powerlink has been finalized. Only after that time should BLM consider granting a ROW for the Phase II project area and then only after consideration has been given to the issues identified immediately below.

2. Initial testing and development phase

Because the SunCatcher technology has not been built at a commercial scale, there are important questions regarding the technological and economic viability of the SES Solar

Two proposal. The proposal site has high value solar resources, as well as significant other values and resources.

Granting a ROW for the SES Solar Two project will prevent any other use of these lands and resources for the duration of the ROW. Because of the presence of solar resources and other values and the uncertainty of the SES Solar Two proposal, the agencies should consider granting an initial testing and development ROW with for a limited time frame and establishing requirements for demonstrating the economic and technological viability of the proposal before extending the ROW. To prevent undue impacts on extensive areas before testing and development is completed, the agencies should limit the acreage of the initial testing and development to the minimum amount necessary for such development.

If SES Solar Two is unable to demonstrate adequate technological and economic viability by the deadline, such an agreement would allow the land to become available for other uses, including the development of a commercial scale solar power facility using technologies which have been successfully constructed at a commercial scale.

Recommendation: BLM should consider establishing requirements for demonstration of technological and economic viability of the SES Solar Two project proposal within the first 3-5 years after the ROW is granted before extending the length of the ROW.

B. Hydrogen

1. Hydrogen production

The Data Response states that the SES Solar Two project will procure hydrogen through a competitive bidding process with suppliers of industrial gasses (Data Response p. PPE-3). The efficiency conversion is stated to be between sixty-five and seventy-five percent; assuming 65 percent, approximately 24,400 therms of natural gas would be utilized in the production process (Data Response p. PPE-3).

Recommendation: The agencies should do an analysis of the energy return on investment to determine the net energy production value of the project.

2. Hydrogen leakage

The Data Response states that the initial buildout of the SES Solar Two facility will require 6.3 million cubic feet of hydrogen (Data Response p. PPE-1). The Data Response states further that the annual leak replenishment consumption of hydrogen for the project is approximately 6.0 million cubic feet of hydrogen, meaning nearly the entire system must be replenished each year.

Recommendation: The agencies should analyze the environmental impacts of the leakage of 6.0 million cubic feet of hydrogen per year and develop strategies to minimize and mitigate any impacts.

C. Bonding

The Data Response states that the plant is expected to have an operational lifetime of at least 40 years, and that when the project is decommissioned at the end of its lifetime, the scrap value of the metal steel and copper alone will cover decommissioning costs of the entire facility including buildings and associated facilities (Data Request p. BIO-10). To ensure that the costs of decommissioning and restoration of the project site are covered, it is critical for the agencies to have an estimate of the anticipated costs as well as a secure mechanism for covering those costs.

The normal accepted bonding method for development on public lands requires the purchase of actual cash bonds prior to development. The ROW could stipulate that the bond will be held in reserve, and the returns from selling scrap metal will be used first for decommissioning and reclamation costs, but the purchase of bonds before development is critical to guarantee protection of our public lands.

To prevent undue financial impacts to the project proponent while guaranteeing full funding for complete decommissioning and reclamation, bonding should be phased in parallel with the project, with bond requirements for each phase based on the amount of development associated with that phase.

Recommendation: The agencies should analyze the anticipated costs of decommissioning and restoring the project site. The agencies should also require actual cash bonds be purchased prior to development. Bonding should be phased in parallel with development, with bond requirements for each phase based on the amount of development associated with that phase.

Thank you for your consideration of these comments.

Sincerely,

The Wilderness Society

Re: Stirling Solar Two – Sierra Club Scoping Comments/Questions for CEC/BLM - EIR/EIS

These Sierra Club Scoping Comments are in addition to any other Scoping comments or concerns submitted by any other subcommittee of the Sierra Club San Diego Chapter for the Stirling Solar Two Project. My apologies for the internet connections that seemed not to correctly link to the sites from which the internet address was copied.

Please continue to address all responses and primary written documents, information, CDs and electronic communications to Edie Harmon in Imperial County, with additional notices and documents/CDs to the Sierra Club San Diego Chapter's office in San Diego.

Concerns addressed in these comments are based on information from SES Executive Summary, Data Request Information and Responses, Public meetings, and materials and information from the 2008-07-24 Pre-application meeting at Imperial County Planning Dept. and information from Bill Powers and various internet sources.

These comments and questions are in addition to those raised by the public, CEC and BLM earlier, both in writing and at public meetings. Project descriptions are in the documents provided by CEC for the Stirling Solar Two Proposal located on approximately 6,500 acres of lands between Interstate 8 and Old Hwy 80 south of the Us Gypsum factory in SW Imperial County. Accordingly, details will not be recited in this letter listing Scoping issues concerns.

Alternatives

The EIR/EIS should discuss a wide range of alternatives which would or could achieve the ultimate goal of reducing usage of fossil fuels in the SDG&E service area. Because IID is a publicly owned utility and not subject to the same requirements as SDG&E, it would be reasonable to consider the combined electrical usage and reduce the reliance on fossil fuels for the combined service area of SDG&E and IID as suggested by Alternatives 1, 2, and 4. All identified Alternatives should reduce or eliminate the irreparable adverse impacts on public lands at the proposed site with its abundant cultural resource values and remove any need for the proposed SDG&E Sunrise Powerlink with its associated environmental impacts on public lands in both Imperial and San Diego Counties.

1. No Project Alternative: In-basin or In County generation for San Diego Gas & Electric with PV units installed on large roof-tops and as shading for large parking areas etc. (See "San Diego Smart Energy 2020 - The 21st Century Alternative" by Bill Powers, 2007, second printing May 2008, available on the E-Tech International website : www.etechninternational.org. Under the heading smart energy.) http://www.etechninternational.org/new_pdfs/smartenergy/52008_SmE2020_2nd.pdf.
2. Use the \$1.4 billion for the Solar Two project and the estimated \$1.9 billion for the Sunrise Powerlink for projects to reduce electrical demand through conservation and improved weatherization of

buildings in both San Diego and Imperial Counties. See 12/31/2008 article about efforts in Texas to increase efficiency and reduce electricity demand: "Electricity study embraces energy efficiency for state" by Tom Fowler Houston Chronicle, Dec. 31, 2008, 10:34PM at: <http://www.chron.com disp/story.mpl/headline/biz/6189695.html>.

3. Stirling SES to install units near source of use in San Diego County close to sources of use such as prisons, factories, industrial parks, etc., and/or similar sites in Imperial County.
4. Stirling Solar Two to provide electricity at dispersed locations in Imperial County because each unit produces grid-ready electricity according to SES.
5. Alternative site at "Mesquite Lake" in the central portion of Imperial County or other sites in Imperial County where soil has already been disturbed. It need not be a single large site but could be several sites because units are purported to be stand alone units or capable of operating in small units according to SES.
6. Use Stirling Dish solar installed at site of existing natural gas or coal fired power plant to provide peaking energy at the existing power plant site thus creating a hybrid electrical generating plant at a single site. Such projects are being studied and referenced in an article entitled "EPRI to Evaluate Adding Solar Thermal Energy to Natural Gas and Coal Power Plants" 10 November 2008 <http://www.greencarcongress.com/2008/11/epri-to-evaluat.html>. Because of the purported stand alone capability and ability to link together a small number of Stirling dish solar units, this might be the most space conserving hybrid solar/fossil fuel power plant design, since there must be some sort of storage or backup power for times when sun is not shining. Money saved by not constructing the Sunrise Powerline transmission line could be used for maintenance at dispersed sites.

Why no electricity proposed for local use in Imperial County?

Why is there no energy from Solar Two which proposes to locate in Imperial County intended for use by Imperial Irrigation District (IID) which provides electricity for residents of Imperial County? According to the December 2008 insert "IID Energy Circuit" which was included with the December 2008 bill, the energy resources used by IID include 52% natural gas, and 24% coal, and less than 1% geothermal and less than 1% solar. If the Stirling Solar Two technology can purportedly produce up to 900 MW of electricity from solar in Imperial County, why is this project not intended to produce electricity for Imperial Irrigation District? Providing electrical power for local IID use should be considered as a mitigation measure to offset all the adverse impacts.

High winds and wind blown debris, sand and dust and MTBF issues

How are the moveable parts of the solar dish or "sun-catcher" assembly affected by high winds and wind blown sand and extremely fine blown dust? What measures will be taken to deal with the effects of wind blown sand and dust on the moveable tracking system that follows the sun and the system for reclining the sun-catchers in the event of extremely high winds and blowing debris/e.g. from chubascos.

To what extent or how much more than at other sites where technology has been tested in CA, NV and NM will high winds and wind-blown sand and dust decrease the "mean time between failure" (MTBF) or increase the need for and frequency of washing of the mirrors? Will mirror wash schedules be on a specific time frame, or will washing become more frequent during times when there is a lot of blowing sand and dust.

Has monitoring of the particulates from blowing sand and dust from the desert, and gypsum dust from the US Gypsum (USG) Plaster City factory been done already? If so what are the results? Will gypsum dust be more or less difficult to remove from mirrors than desert sand and dust? What is the current expected MTBF at the Sandia site, and what is the expected MTBF for the Solar Two site in the lower elevation and much higher summertime ambient temperatures and with much higher air borne particulates? What factors contribute to increasing or decreasing MTBF at the proposed Imperial County site?

Low MTBF make the system:

- (a) less reliable, (See 2007-06-01 testimony of Barry Butler, Ph.D. on dish/Stirling Solar Technology before the CPUC at p.3 where he cites MTBF as little as 40 hours requiring shutdown and maintenance)
- (b) increasing the down time for maintenance to keep the system “available” to generate electricity.

A December 2008 article includes continuing concerns of Dr. Butler and others about current feasibility of technology to meet Stirling’s contract with SDG&E by the end of 2010. Soto, Onell R. 2008-12-14. “From prototype to powerhouse” San Diego Union at SignOnSanDiego.com, at: <http://www3.signonsandiego.com/stories/2008/dec/14/mz1b14sdge91643-prototype-powerhouse/?zIndex=22515>.

What is the current estimated MTBF at the Sandia site at present and how do the winds and potential for wind-blown sand at the Solar Two site compare with the test site at Sandia or other test sites tested in CA? (Butler estimated that MTBF was currently “a few hundred hours” in his 2007 testimony (at p. 5)

How will equipment be protected from damage from sand blasting associated with high winds or sudden chubascos coming up from the south with their wind blown debris? Note the potential for very sudden onset of chubasco winds from the south.

Jobs for whom and where? And with what requirements for technical expertise?

SES estimated 700 construction jobs and 160 permanent jobs. What are the skill levels necessary for these jobs? How many of the employees are expected to be from the local Imperial County residents? How many of the jobs will be for employees brought in from other states? What is the infrastructure necessary for the “almost continuous maintenance” related to the existing “technical deficiencies” associated with the dish solar technology?

Risks and problems associated with going from proto-type technology to industrial scale installation without some smaller scale or intermediate demonstration project first

What are the anticipated problems associated with going from a prototype technology (6 dishes at Sandia) to a utility scale, commercial installation with 12,000 dishes in Phase I and an additional 18,000 dishes for Phase II? How will this affect the ability of Solar Two to meet the SDG&E contract deadline of 2010? Who, or what agency or entity will bear the risks, both financial and in terms of equipment failures and associated operations and maintenance problems at the proposed Imperial County site?

Will there be a slow, experimental step up from prototype dish solar units to the proposed 12,000 and then 18,000 additional dish units installed? Are there criteria associated with costs for installation and production, reliability and maintenance costs, or a level of MTBF which might trigger a reassessment of the advisability of continued installation of additional dish solar units?

Earlier concerns about the Stirling solar projects and the issues associated with going from prototype to full scale industrial solar projects with thousands of units were raised in a 2005 article in MIT’s Technology Review, and many appear not to have been resolved in the more than three years since the article appeared. Why? The article titled “a Sunshine Deal” is appended at the end of these comments and is found at: <http://www.technologyreview.com/energy/14781/page1/>.

Mean Time Between Failure (MTBF)

What are the other factors related to low MTBF and the need for continued maintenance? Butler (2007 at p. 3) cites reliability problems including “hydrogen leakage through joints and seals, internal engine seal leakage, swashplate actuator stalls, and heater head braze joint hydrogen leaks” requiring down time for maintenance. How difficult is it to detect the source of leaks, what technology or skills are required to repair the leaks or replace leaking seals? How much time is required for this maintenance. A MTBF of 40 (Butler) or even 200

hours (DOE, 2008 at p. 117) suggests that this technology is still not ready for industrial/commercial scale installation at this time. How does the low end MTBF or any MTBF less than 4000 hours impact the “annual solar -to-electric efficiency of 24%” as cited by DOE in its 2008-4-15 Solar Energy Technologies Program - Multi Year Program Plan 2008-2012 at p. 107? DOE indicates that “Complete design of dish-engine system capable of 4000 hrs MTBF” was not “due” until 6/20/2011 (DOE at p. 107), or after the SDG&E contract delivery date., thus voiding the contract. What is the anticipated MTBF at the time of proposed installation in Imperial County? Is the solar-to-electric efficiency expected to be the same, less than the efficiency of the 6 units at Sandia? What are the primary factors affecting efficiency? How is efficiency related to daytime ambient temperatures? Is it expected that there will be seasonal variations in efficiency based on daytime ambient temperatures.? There could be about an 80 degree difference between daytime temperatures in the winter and summer.

Where are the facilities to be located for construction, testing, and to provide materials for maintenance of the dish solar units? How will component parts, structural material, mirrors and Stirling engines be transported to the site, and over what time frame? What are the energy requirements for such transport?

How much hydrogen will be stored on site and where? What risks are associated with the storage of hydrogen needed for this project?

Financial: Money from where and how much

Have the Irish financial backers for this project ever financed or participated in any other dish solar project anywhere in the world? If so, where? These are risky financial times. Is the financial backing available to fund construction through completion of Phase I and to cover operating and maintenance costs? What other renewable technologies has the Irish National Toll Road Company (NTR plc) developed and operated? What is the scale of those projects and the energy production capability and reliability?

At the 2008-07-24 Pre App meeting we were told by SES’s consultant that the project cost is \$1.4 billion, but that funding has been secured for only \$100 million. What is the source for the needed \$1.3 billion that was not yet then secured? How much funding is necessary prior to construction and installation of this still prototype technology in Imperial County?

How realistic is it that the financial resources necessary for this proposed project going from prototype to fully functional will be available in these financially troubled times? Please note the following in the 2009-01-01 Houston Chronicle entitled “Lending woes push alternative energy to back burner” by Kristen Hays:

But access to credit, particularly for ventures that require years of patience before providing returns on high startup costs, fueled the momentum more than record crude prices, said Joseph Stanislaw, a former economist at the Paris-based International Energy Agency and founder of the Boston-based energy advisory firm JA Stanislaw Group.

Several months into the credit crisis, the alternatives and renewables sector faces a difficult road ahead until banks, venture capitalists and private equity firms start lending and investing again.

“A lot of companies — solar, wind or others — found their credit lines were just cut. They need access to credit. A lot of these things aren’t going to be economic tomorrow morning even if we have \$140 oil,” Stanislaw said. at <http://www.chron.com/dispatch/story.mpl/headline/biz/6190611.html>

Financial assurances and bonding for dismantling, cleanup and removal after operations cease

Who pays for disassembly and how are disassembly and removal costs of units and materials after operations cease calculated and or recalculated as times and economics change? Will all components have resale or recycle value? If so, by whom and at what distance? Are there some components for which there is no anticipated salvage value and which might require transport to a special waste facility? What is the anticipated cubic volume of materials that would need to go to a waste facility after facility operations cease? How will costs and energy requirements for cleanup and removal be calculated and periodically updated? Will bonding up-front be adequate? Where will salvage metal go, at what cost? Are the mirrors recyclable? If not what is

their ultimate disposal site, what volume will mirrors occupy when removed, and what is the ultimate anticipated destination of the mirrors? What hazards are anticipated associated with dismantling the units, dangers associated with the hydrogen in the engines, or plastics coatings, and mirrors. What was the estimated cost and time needed for disassembly and moving of the dish solar units from Huntington Beach CA to Sandia? Costs/unit and costs/mile? Were units or portions thereof moved by truck or train?

Will the project applicant be responsible for the entire bond or will San Diego Gas and Electric be responsible for some or all in the event that cleanup and dismantling are more than what is covered by bonding?

Other test sites and reliability issues

There are 6 test units at Sandia, but the SES Executive Summary at p.1-2 suggests that this technology has been “operating in a variety of locations including Huntington Beach and Daggett, California” ... for more than 20 years. What are the MTBF figures, environmental conditions including wind, and what have been the most significant and most frequently recurring maintenance problems at each site, Huntington Beach and Daggett, CA? What are the differences in MTBF between sites where tests were done in CA and at the much higher and colder site at Sandia? What do these differences in MTBF suggest about operational problems in the low hot dry desert of Imperial County CA? What is the length of down time for maintenance and repairs when units are down and not generating electricity? Are the problems related more to technology or to site locations? Is it possible to see dish solar units at those sites, and who operates the sites?

It is expected that “about 10% [may be down or] not being used” because they need maintenance and repairs (CEC Final Staff Report 2007-12 Attachment 3 at p. 50). If there are 18,000 units at the Solar Two Phase I site, this would mean that at any given time 180 dish solar units would be in need of repair! How long are repairs expected to take, and how many employees are needed to safely work on each unit needing maintenance and repairs. Is maintenance expected to be on an on-going basis or only when equipment fails? Is it expected that the repairs will be able to be done by local residents from Imperial county, or will the maintenance and repairs be done by technical specialists brought in from outside Imperial County?

If “Construction of the Project is expected to begin in late 2009 or early 2010 and will take approximately 40 months for full Project completion” (SES ES at p. 1-3) how will this meet the SDG&E deadline?

What does “overall availability of approximately 99 percent” (SES ES at p.1-3) mean for this project with a 10% down time at a minimum?

Lowered efficiency issues in hot summer temperatures of desert in W Imperial County vs Sandia NM

Since the SES Issue Identification Report at p. 3 in process description states that: “Waste heat from the engine is transferred to the ambient air via a radiator system similar to those used in automobiles.” If the system operates like automobile radiator systems, is there a chance that the system will “overheat” as radiators do in the hot summer months? How is the efficiency of the system impacted by operation at the high 120 degree summer temperatures in Imperial County desert rather than the cooler summer ambient temperatures of the high elevation Sandia NM location? What is the reduction in anticipated efficiency because heat loss year round will be to a much warmer ambient temperature?

Water issues

What is meant by the phrase “raw water per minute” when referring to washing the mirrors and engine? How much water is anticipated to be used to wash each unit per wash cycle or per year? How much evaporates, and how much runs off the mirrors to the ground? What precautions will be taken to prevent or control invasive species that might germinate and grow as the result of additional wash water run-off associated with the washing of each mirror assembly? “ Invasive species observed on the Project site include red brome (*Bromus madritensis*), Bermuda grass (*Cynodon dactylon*), crystalline iceplant (*Mesembryanthemum crystallinum*), Saharan mustard (*Brassica tournefortii*), and various species of tamarisk (*Tamarix* spp.)” according to the Data Request document. All of these species would appear to present potentially serious problems with the addition of washwater runoff. And all have the potential to out compete native species in the area. It is recommended

that herbicides not be used, but that invasives be removed manually as they start growing.

Wastewater impoundment and liner issues

What precautions or mitigation measures would be needed to prevent the establishment of invasive species, especially tamarisk near the wastewater impoundment? Will the high TDS materials be evaporated or dried in a 3 million gallon wastewater pond within a year before moving to a hazardous waste facility? If so would the second storage unit for use while the salts are drying in the first be of the same size and depth? 3 million gallons is more than 9 acre feet. Pan evaporation rate in Imperial County is approximately 100 inches/year. Where is the Hazardous waste facility, and what precautions will be taken to prevent the waste solids from moving from the hazardous waste site, either in the form of run-off or as windblown particulates? What is the size (surface area and maximum depth) of the wastewater impoundment(s)?

How will the evaporites be removed from the double lined wastewater evaporation ponds? What precautions will be employed to prevent punctures or tears of the liners? What methods will be used to monitor and detect, and repair any leakage in the liners? Will the liners become more brittle over time as they are exposed to salts of increasing concentration and exposure to dry hot air and sunshine in summer months and changes from day to night time temperatures in the winter months? With what frequency will the liner systems be replaced and how and where will be the ultimate disposition of the liner system materials when they need replacing or at the end of the project? What is the anticipated volume of the liner system materials at time of disposal? Costs of disposal? Will they classify as hazardous waste or is there any facility currently that has a process for recycling the liner materials? If so where? All plastic or liner materials must be removed so that they do not break up and get dispersed and ingested by unsuspecting wildlife or birds mistaking them as food. Plastics and food wrappers have been found in desert wildlife scat throughout Imperial County. These “decommissioning” issues must be addressed based on present technology rather than speculations about availability of some unknown future technology.

What precautions would be taken to prevent such a wastewater storage facility from attracting migratory birds or birds that would otherwise be seeking less saline water sources or the shores at Salton Sea or along the waterways of Imperial County? This is of special concern as the salinity and toxicity of the wastewater evaporation ponds increases prior to removal of evaporites to a hazardous waste facility. What processes would be employed to attempt to reclaim the totally denuded and disturbed lands beneath the evaporation ponds so that they don't just become additional sources of windblown dust and sand. If reclamation is contemplated, how will it be done?

Cultural Resources and the possibility of the designation of the site as an ATCC to protect cultural resource values

The issues identification documents indicated that there is an unusually high concentration of cultural resources in the proposed project site and vicinity and that such resources are very important, as was attested to by the statements of Carmen Lucas at the November 24, 2008 meeting and her presence at the request of the State Historic Preservation Office.

Accordingly, it is recommended that all archeological and cultural resource studies be evaluated by several outside consultants familiar with the archeology and cultural resources of this part of the desert before being released for inclusion in the Draft EIR/EIS. (This might avoid some of the problems that were experienced with the studies on cultural resources for the Glamis Imperial Mine Project many years ago. At the proposed Glamis Imperial Mine Project site, a significant area was ultimately designated as an Area of Traditional Cultural Concern (ATCC) because of the cultural significance to many Native American peoples and the proposed mine project was denied by the BLM under the Clinton Administration.) After hearing Carmen Lucas and reading of the concerns of BLM and the CEC staff, it seems prudent up front to consider whether the proposed Stirling Solar Two site or portions thereof should be considered for designation as an **Area of Traditional Cultural Concern** and protected from the kinds of massive destruction that would inevitably accompany the construction of the proposed solar project. Input and concerns about this general area and site should be sought from Native American groups and SHPO .

Visual resources and views in the eyes of the beholders

Visual resources are an important component of cultural resource values and the proposed project would destroy any visual resource values associated with this site in addition to physically destroying the resources on the ground. Not all agree with SES's assertion that the dish solar units would constitute a Tourist attraction, many would see them as a visual blight or an "eyesore". It is suspected that SES's views may be influenced by the sight of dollar signs. The visual resource impacts must be evaluated not just for this project alone, but in the cumulative impacts evaluations including all wind, solar and geothermal energy developments proposed for public lands in SW Imperial County. The proposed project will contribute to the more rapid creation of a rural sacrifice area with the communities of Ocotillo and Nomirage at the center of the sacrifice area.

Traffic

Any traffic analysis should include the traffic traveling to the Centinela State Prison, both for staffing and for visitors using Dunaway Road because the State Prison is the nearest and largest population center to the Solar Two Project site. The State Prison has a work force of more than 1,000 employees and an involuntary resident population that exceeds 5,000. Centinela State Prison is the nearest residential community of any size and should be identified by name on all maps of the project vicinity.

Health

Earlier transmission projects across public lands in Imperial County identified the fungus that causes Valley Fever as a serious health threat when soils are disturbed. Coccidioidomycosis is considered to be a health epidemic in parts of SW Arizona and the potential impacts of surface disturbing activities on both employees of the site and the involuntary population at Centinela State Prison must be considered. See http://en.wikipedia.org/wiki/Centinela_State_Prison. for information about the number of staff and prison population as of 9/2007. This is especially true as relates to the population of the State Prison where inmates coming to the prison are most likely to be from areas where they have not previously been exposed to the fungal spores. (See: "Infection hits a California prison hard" in *New York Times* 2008-12-30 at <http://www.nytimes.com/2007/12/30/us/30inmates.html>. Internet copy no longer available, scanned copy submitted as Exhibit 215 in support of comments on the US Gypsum FEIR/EIS will be sent separately.) Inmate health is an issue for local health care and paid for by taxpayers. Additional information on Valley Fever can be found at <http://www.valley-fever.org>.

Cumulative Impacts

In addition to any other project considerations, the Stirling Solar Two project must include discussion of the cumulative impacts of its project in addition to the impacts from the closest major project proposed on the west side of Imperial County, the proposal by Wind-Zero to develop almost 1000 acres immediately adjacent to the eastern boundary of residential community of Nomirage in a site located to the south of Interstate 8 and N of State Hwy 98 and bordered on the east by the BLM's Yuha Desert Area of Environmental Concern. Details of the project can be found in a multi page listing by Wind Zero on the internet at www.wind-zero.com.

This proposal has generated major concerns and opposition from residents in the groundwater dependent communities in the Ocotillo Nomirage Community Planning Area. For issues raised by those opposed to the Proposed Wind Zero project see www.wind-zero-ocotillo.org and "Wind Zero Uncovered" at: http://www.wind-zero-ocotillo.org/Home_Page.html.

Cumulative impacts discussion must also include air quality impacts associated with ORV activities at the BLM Plaster City OHV Open Area to the west and north of Plaster City and the impacts fo Plaster City activities, and the impacts of all air quality issues on the involuntary population at the nearby Centinela State Prison.

Another nearby Green Hunter Wind Energy proposal on 6,300 acres of public lands that has the potential for adverse impacts to both public lands managed by BLM and to the community of Ocotillo is the proposed wind energy project which is located to the north, east and west of private lands in the community of Ocotillo. From maps, it appears that the eastern boundary of the proposed wind energy project would be very close to the

western boundary of the Solar Two project. See:

http://www.blm.gov/pgdata/etc/medialib/blm/ca/pdf/elcentro/nepa/2005.Par.11648.File.dat/FONSI_DR_EA_GreenHunter.pdf. In addition, there are two other wind energy proposals on BLM lands in the Ocotillo area.

The Cumulative Impacts discussion should discuss the vast biological, cultural, environmental justice, and air impacts of **all the energy projects** and include a list giving location and acreages and status of **all renewable energy projects** (including both wind and solar) in Imperial County. It appears that the communities of Ocotillo and Nomirage are being designated as rural sacrifice areas to be blighted and surrounded by industrial energy projects that will do nothing for local energy costs. The cumulative impacts associated with visual resources and subject of BLM's Visual Resources Management Handbooks and instructions to be found at BLM's VRM website. For a list of other proposed Solar energy projects in Imperial County see BLM's Renewable energy projects tables at: http://www.blm.gov/pgdata/content/ca/en/fo/cdd/alternative_energy/SolarEnergy.html.

Solar Energy Projects site for the BLM CA Desert District website includes the table of both solar and wind energy proposals for the BLM El Centro Field Office in Imperial County. This BLM table indicates six (6) wind energy projects proposed for 24,214 acres and eleven (11) solar energy projects proposed for about 64,000 acres. Of these 3 of the wind energy projects are proposed for 9,686 acres of public lands in the Ocotillo area in addition to the Stirling Solar Two project. Portions of the BLM Renewable energy table at pages 4,5, 15,16 listing proposals in the BLM EL Centro Resource Area Imperial County sector follow the list of references.

The cumulative impacts of energy production should also include the nonrenewable energy source of geothermal energy projects on both public and private lands in Imperial County. Geothermal energy resources are classified by BLM as a "leasable mineral".

Elsinore/Laguna Salada Earthquake Fault

The project will be located adjacent to and east of the Elsinore/Laguna Salada Fault. There was an earthquake of magnitude 7.2 in the 1890s which resulted in vertical displacement, still visible today further south and damage as far away as San Diego. Is the proposed design of the dish solar units on a single structure capable of withstanding an earthquake of that magnitude when the fault is so close? What features are incorporated into the design and siting structures to prevent damage from a magnitude 7+ earthquake. Have there been simulated shake or vibration studies to determine the functioning of mirrors at the outer margins of the dish and whether or not there might be significant distortions of the framework supporting the mirrors? Remember that it was the Public Works Department with the County engineer's office that sustained the greatest damage in the County's Administration building which had to be demolished after that "earthquake proof" building was severely damaged by the 1979 earthquake with its epicenter east of Calexico CA!

A Sunshine Deal

By 2010, thousands of homes in southern California may be getting energy from a giant solar farm.

By Tim Gnatek at <http://www.technologyreview.com/energy/14781/page1/>

For years now, electricity shortages have encouraged power companies to look for alternative sources of energy. And state governments are getting onboard as well. So far, 20 states, including Colorado, Massachusetts, New Jersey, and New Mexico, have established renewable energy production standards.

Add in the current sky-rocketing oil prices, and energy providers will be pushed even more to develop alternative energy sources.

Nowhere is this trend more apparent than in California, where rolling blackouts still affect a power-hungry population. It's not surprisingly, then, that California may host the largest solar-energy project in history. Southern California Edison (SCE), with 13 million customers, has just announced a deal with Phoenix-based Stirling Energy Systems that could result in a huge solar farm.

The California utility is already the nation's largest purchaser of renewable energy, providing its customer with more than 2,500 megawatts of wind, geothermal, solar, biomass, and small hydroelectric-derived energy, or around 18 percent of its total power load.

Now SCE has agreed to purchase upwards of 500 megawatts of electricity from Stirling Energy Systems -- enough to provide all the energy needs to 278,000 homes -- or more than all other U.S. solar projects combined. While neither company has disclosed the financial details, SCE said the system will not require state subsidies.

The effort will begin with a pilot project: a proof-of-concept facility with 40 solar dishes producing one megawatt of energy. The test will take place over the next 18 months, and, if successful, Stirling Energy Systems will construct a 20,000-dish array over four years, covering 4,500 acres -- more than four times the size of the National Mall in DC -- in the desert northwest of Los Angeles.

"From our perspective, Stirling has established the viability of this at a laboratory level," says SCE spokesperson Gil Alexander. "This could be a turnaround point for solar."

Stirling's dish technology, which was first developed by McDonnell-Douglas in the mid-1980s, makes use of a heat-driven engine, rather than photovoltaic panels. The company's deal with SCE marks its first utility-scaled energy application.

In the Stirling solar system, each dish is a round, mirrored surface measuring 37 feet in diameter that reflects and focuses light into the receiving end of a Stirling engine. The engine itself, which was actually invented in 1816 by a Scotsman, Robert Stirling, is driven by the heating and cooling of a closed gas (see Notebook).

To date, Stirling engines -- with their minimal emissions, long life spans, and quiet operation -- have produced refrigeration and even powered submarines. In the solar version, the dishes concentrate heat, which can rise to more than 720 degrees Celsius, causing hydrogen gas to expand, which in turn drives pistons and an electricity generator.

Stirling Energy Systems has been operating a six-dish system since January at the Sandia National Laboratories test facility in New Mexico. There, the company converted its centuries-old technology into an efficient means of energy generation by using modern materials and programming that tracks solar progression and accounts for cloudiness and winds. The six dishes generate enough power for six homes, with their peak energy flow coming at the hottest parts of the day -- when utility needs are greatest.

"Our systems have peak efficiency of 29.4 percent -- that's the record for converting solar to grid-quality energy," says Stirling CEO Bruce Osborn.

A neutral observer has also given the Stirling solar design a good review. "This is a very high efficiency system," says Frank Wilkins, solar thermal team leader in the U.S. Department of Energy's Office of Energy Efficiency and Renewable Energy. "It's modular and has low water consumption, which is critical in desert areas. Of all the solar energies of the moment, this is at the top... You have to figure, this exercise is going to get [Stirling Energy Systems] more competitive in the energy market," Wilkins says.

Despite his optimism, though, Wilkins also wonders how easily the system would translate into a utility-sized operation.

"Even 40-dish systems haven't been built before, so there's a lot that hasn't been scaled to large systems," says Wilkins. In particular, he points to unknown operation and maintenance demands, as well as cost limitations.

"[Cost] been a sticking point with the other thermal technologies I work on that use solar heat to produce electricity [like heliostats]," Wilkins says. "The cost has to come down, whether through research breakthroughs or industries deploying the system."

Producing enough energy to offset the cost is what Stirling Energy Systems hopes to accomplish with its SCE deal, since high-volume fabrication should drop costs. The Department of Energy has stated that the prototype dishes at Sandia cost \$150,000 to build; Stirling has estimated that large-scale production could bring down the cost to under \$50,000 per dish.

Although it will provide environmentally friendly energy, the Stirling project will still make a mark on the Mojave landscape, covering as much as 4,500 acres when completed. Daniel Patterson, a desert ecologist with the Center for Biological Diversity, wants to be sure concerns for native wildlife are also addressed as planning proceeds. Parts of the desert are home to endangered animals like the desert tortoise, whose habitat has become encroached upon by mining, development and livestock grazing.

"We want to be very supportive of curbing fossil fuels," Patterson says, "but citing the actual location of the projects is important."

Stirling CEO Bruce Osborn says that their concerns will be addressed. "We're looking at a combination of Bureau of Land Management and private land, and we will certainly have to go through environmental studies to be sure it's good with the flora and fauna," Osborn says.

Osborn also reiterates that the system should bear less impact on the environment than other existing energy production methods: "the Stirling system takes less land than other solar systems, and requires minimal land grading. Plus, there are no toxic chemicals, and we use minimal water -- only a little to wash the mirrors every month...From our standpoint, we're very enviro-friendly."

In April at a DOE workshop (see links in Notebook), top solar scientists from academia and industry assessed the state of solar research. According to their findings, while solar power is improving, significant technological breakthroughs are still needed before it makes a dent in carbon-based fuel consumption.

"We need to double worldwide energy production by 2050," said Dr. George Crabtree, the Director of Materials Science at the Argonne National Laboratory in Illinois, who co-chaired the meeting, adding that in the long run, though, our society will "need something other than fossil."

To Crabtree, Solar is the most promising energy source because of its sheer volume: the sun provides more energy to the Earth in one hour than all the energy consumed by the planet in a year. Nevertheless, solar remains largely untapped, making up around one millionth of the world's total electrical supply, according to the report.

"If you want to have solar 50 years from now, you have to invest in doing it dramatically better," says Crabtree, "because the learning curve [for scientists and engineers] is steep."

Crabtree hesitates to put a figure on how much he thinks federal funding should increase, but asserts that current levels are not nearly enough. Current estimates put federal funding for solar research at approximately \$10 million, while industry experts estimate the need for at least \$30 million annually to support research.

Although Crabtree doesn't see Stirling Energy Systems' dish technology as necessarily a technological revolution, he does think it's encouraging to see industry players adopting solar energy.

"Making it work, putting it out in the field -- you might call that a cultural advance," says Crabtree.

Christopher Meyer
Project Manager
California Energy Commission
1516 9th Street MS-15
Sacramento, CA 95814

Mr. Jim Stobaugh, BLM Project Manager

Re: **Scoping Comments on Stirling Energy Systems Solar Two Project,
Application for Certification, Stirling Energy Systems Solar Two, LLC,
08-AFC-05**

Dear Messrs. Meyer and Stobaugh,

The Mussey Grade Road Alliance ("Alliance") requests that the comments contained in this letter be included in the scoping of the above-mentioned project and fully incorporated into the review of this project under the National Environmental Protection Act ("NEPA") and the California Environmental Protection Act ("CEQA").

The Alliance intervened in the A.06-08-010 application proceeding of the California Public Utilities Commission and opposed San Diego Gas & Electric Company's application to build the so-called "Sunrise Powerlink" transmission line in San Diego County. The Alliance intervened on the basis of both the threat of wildland fire ignition by the proposed project over the life of the line and the negative impacts of the project on backcountry communities. The briefs and testimony of the Alliance can be accessed at www.musseygraderoad.org and www.mbartek.com

The Alliance requests that all findings of the Final EIR in A.06-08-010¹ regarding impacts of this Stirling Two project,² including all mitigation measures,³ be incorporated into the record for this project and used to scope the project.

¹ See <http://www.cpuc.ca.gov/environment/info/aspn/sunrise/toc-feir.htm>

² See Sections D.2 -- D.15

³ Ibid at D.2.19 through D.2.20; pp.D.2-201 - D.2-269.

We have serious concerns about the viability of the Stirling Energy Systems (“SES”) technology and whether this technology will work. We are especially concerned in light of the testimony of Dr. Barry Butler,⁴ who testified in the Sunrise Powerlink proceedings. Dr. Butler, who ran the United States Department of Energy Dish/Stirling Joint Venture Program, stated that the dish/Sterling technology needed continuous maintenance to work:

I was the SAIC project manager for a dish/Stirling design that was in competition with the SES design. By 2002, SAIC had also demonstrated relatively high availability of the system for periods of time. However, the “mean time between failure” was approximately 40 hours. Major reliability problems with the SAIC Stirling engine included hydrogen leakage through joints and seals, internal engine seal leakage, swash plate actuator stalls, and heater head braze joint hydrogen leaks. That means that on average once every 40 hours a problem of some type required shut down and maintenance. Nearly continuous maintenance was necessary to keep the system “available” to generate electricity. SES has also demonstrated very high availability, though this has been achieved by a program of continuous maintenance. In 2002, SES and SAIC both had dish/Stirling units operating at the University of Nevada – Las Vegas. Power output was greater for SES than SAIC. Both SAIC and SES conducted maintenance on a nearly continuous basis to keep the units available for electricity production.⁵

Dr. Butler also testified that dish/Stirling is not cost-competitive at this time with conventional power generation or other forms of renewable power generation such as wind and solar. He said that wind and geothermal are fully commercial renewable energy technologies with a cost of energy of approximately 5¢ US/kWhr each.⁶ He also said that the commercial viability of the Stirling system is unproven at this time.⁷

It is incumbent on the agencies reviewing this project to determine that the technology works. Otherwise, public land, owned by all Americans, would be sacrificed and the Bureau of Land Management’s stated policy to facilitate *environmentally responsible commercial* development of solar energy projects *on public lands*⁸ (emphasis added) would be ignored. The agency review demands that chimeras in the desert do not destroy either our public lands or our belief in government to protect them.

Sincerely,

/s/ Diane Conklin

Testimony of Dr. Barry Butler on Dish/Stirling Solar Technology

1. INTRODUCTION

My name is Barry L. Butler, PhD. As more fully outlined in my resume, Appendix A, I have a PhD in Materials Science and am the former vice president and manager of SAIC's Solar Energy Products Division. I joined the Solar Energy Research Institute, the predecessor to the National Renewable Energy Laboratory, in 1978, soon after it began operations. Prior to that time I worked at Sandia National Laboratory specializing in solar optical materials. I wrote the chapter on cooperative solar thermal commercialization activities in the book "Implementation of Solar Thermal Technology" published by MIT Press in 1996. I have written or co-authored over 10 technical papers on all aspects of dish/Stirling solar technology development. I was the president of the Concentrating Solar Power Division of the Solar Energy Industries Association from 1998 to 2002, and I am the owner of Butler Sun Solutions, a firm specializing in the design and sales of solar hot water heating systems.

2. BACKGROUND

San Diego Gas and Electric (SDG&E), a company owned by Sempra Energy, has filed an application to the CPUC claiming a 150 mile, 1000 MW transmission line is needed to import energy into San Diego County to ensure the reliability of the regional transmission system on peak demand days, and has further suggested the transmission line is needed to encourage the development of renewable power in Imperial Valley. SDG&E has signed a power purchase agreement (PPA) with Stirling Energy Systems (SES), Phase I of which is for a 300 MW dish/Stirling array, a total of 12,000 of their 25

Testimony of Dr. Barry Butler on Dish/Stirling Solar Technology

kW dish/Stirling systems, in Imperial County that must be delivered in increments between 2008 and 2010, as is stated in the CPCN (p. III-11):

The Agreement with SES contemplates the purchase by SDG&E of up to 900 MW of new solar related energy from SES in three phases. Phase 1 consists of 300 MW scheduled for delivery in the 2008 to 2010 timeframe. While the first phase will provide 300 MW when all construction is completed, the capacity will be added in increments over the 2008 through 2010 period. Phase 2 project consists of an additional 300 MW in the 2011 to 2012 timeframe. SDG&E also has a right of first refusal for a third phase for another 300 MW phase.

According to the SDG&E, commercial production is expected to begin in 2008.

The economic terms of the contract, specifically the \$/kwh price that SDG&E will pay SES for the power, is unknown.

There are currently six prototype 25 kW Stirling dishes in operation at Sandia National Laboratory. I have been asked to opine on the reliability and cost of SES dish technology and whether it is feasible or realistic to expect that SES can meet the contract schedule defined by SDG&E.

3. DEVELOPMENT HISTORY OF DISH STIRLING TECHNOLOGY

I co-authored a 2003 paper that includes a brief history of the development of dish Stirling technology.¹ I have excerpted the following summary of dish Stirling technology from that paper.

Over the last 20 years, eight different Dish-Stirling systems ranging in size from 2 to 50 kW have been built by companies in the United States, Germany, Japan, and Russia. The first of the historical systems, the 25-kW Vanguard system built by ADVANCO in Southern California, achieved a reported world record net solar-to-electric conversion efficiency of 29.4%. In 1984, two 50-kW Dish-

¹ T. Mancini, P. Heller, B. Butler, B. Osborn, W. Schiel, V. Goldberg, R. Buck, R. Diver, C. Andraka, J. Moreno, *Dish-Stirling Systems: An Overview of Development and Status*, Journal of Solar Energy Engineering, Vol. 125, pp. 135-151, May 2003.

Testimony of Dr. Barry Butler on Dish/Stirling Solar Technology

Stirling systems were built, installed, and operated in Riyadh, Saudi Arabia, by Schlaich-Bergermann und Partner of Stuttgart, Germany.

A third Dish-Stirling system was built by McDonnell Douglas Aerospace Corporation (MDAC) in the mid 1980s and, when MDAC discontinued development of the technology, the rights to the system were acquired by the Southern California Edison Company (SCE). SCE operated the system from 1985 to 1988. Stirling Energy Systems (SES) of Phoenix, Arizona, acquired the technology rights and system hardware in 1996 and have continued development of the system. In 1991, Cummins Power Generation, working under costshared agreements with the U.S. Department of Energy and Sandia National Laboratories, started development of two Dish-Stirling systems: a 7-kW system for remote applications and a 25-kW system for grid-connected power generation. Cummins was innovative in its Dish-Stirling systems, incorporating advanced technologies into the designs. . . The two Cummins programs made progress, but were terminated in 1996 when Cummins' parent company, Cummins Engine Company, realigned business along its core area of diesel engine development.

Dish-Stirling systems have demonstrated that they are capable of producing electricity for the grid and for remote power applications. Technology development needs are for low-cost components and systems that can operate unattended at very high levels of reliability.

SES acquired the intellectual and technology rights to the McDonnell Douglas concentrator and the license to manufacture the USAB (now Kockums) 4-95 Stirling engine based power conversion unit (PCU) in 1996.

The (SES) systems are continuously monitored and repaired whenever a problem occurs. Consequently, they have demonstrated excellent availability, greater than 98%, during the most recent 1,000 hr of operation.

I was the SAIC project manager for a dish/Stirling design that was in competition with the SES design. By 2002, SAIC had also demonstrated relatively high availability of the system for periods of time. However, the "mean time between failure" was approximately 40 hours. Major reliability problems with the SAIC Stirling engine included hydrogen leakage through joints and seals, internal engine seal leakage, swashplate actuator stalls, and heater head braze joint hydrogen leaks. That means that

Testimony of Dr. Barry Butler on Dish/Stirling Solar Technology

on average once every 40 hours a problem of some type required shut down and maintenance. Nearly continuous maintenance was necessary to keep the system “available” to generate electricity. SES has also demonstrated very high availability, though this has been achieved by a program of continuous maintenance. In 2002, SES and SAIC both had dish/Stirling units operating at the University of Nevada – Las Vegas. Power output was greater for SES than SAIC. Both SAIC and SES conducted maintenance on a nearly continuous basis to keep the units available for electricity production.

Dish/Stirling is not cost-competitive with conventional power generation, or other forms of renewable power generation such as wind and solar, at this time. Wind and geothermal are fully commercial renewable energy technologies with a cost of energy of approximately 5¢ US/kWhr each.² As noted in the 2003 Journal of Solar Energy Engineering paper I co-authored:³

In the U.S., niche markets for Dish-Stirling power generation depend on federal or state government subsidies, required to close the gap between the current cost of power from these systems (~30¢ US/kWhr) and the price that the market is willing to pay (~6¢ US/kWhr), a difference of 24¢ US/kWhr.

Even at the relatively low production rate of 50 MW/yr (~2,000 25-kW systems or 5,000 10-kW systems) and at an O&M cost of 1–2¢/kWhr, the cost of electricity from Dish-Stirling systems will be 15–20¢/kWhr enabling entry into some village and remote-power markets. As system costs fall and reliability improves, it is reasonable to expect leveled energy costs of less than 10¢

Testimony of Dr. Barry Butler on Dish/Stirling Solar Technology

US/kWhr, which will expand the markets to distributed generation and demand-side applications.

A “mean time between failure” between 2,000 and 10,000 hours must be proven before dish/Stirling can be incorporated into utility-scale installations.⁴ The current “mean time between failure” is a few hundred hours. This means a great deal of time, effort, and money must be spent on maintenance. This drives up the cost of operating a dish/Stirling unit. The commercial viability of the Stirling system is unproven at this time.

4. PILOT INSTALLATION IS NEXT LOGICAL STEP IN DISH/STIRLING DEVELOPMENTAL PROGRESSION

The 1 MW pilot project being developed by SES for SCE is a good example of a necessary and prudent incremental step to ensure all the technical deficiencies in the first generation production model are worked-out before scaling-up to arrays involving many 1,000s of individual dishes. It is also instructive that SCE, a company with extensive experience with dish/Stirling technology and the company that sold the technology to SES, is requiring the successful deployment of a 1 MW pilot project before scaling-up to a utility-scale installation.

SDG&E has no experience with the operation of dish/Stirling technology, and is proposing to go straight from the prototype to a utility-scale installation. Few or none of the benefits of the 1 MW pilot test will be available to SES as it moves to full commercial scale production to satisfy the SDG&E contract(s), as the 1 MW pilot has not yet begun operation and full commercial production must begin in a matter of months if SES hopes

⁴ R. Caputo, B. Butler, *Solar 2007: The Use of “Energy Parks” to Balance Renewable Energy in the San Diego Region*, accepted for publication, American Solar Energy Society, 2007 Annual Conference, Cleveland, July 2007.

Testimony of Dr. Barry Butler on Dish/Stirling Solar Technology

to meet the 2010 deadline established in the SDG&E contract. This is neither prudent nor possible unless the technical risks of the operation and maintenance are quantified and then apportioned between the federal government, investors, SES and SDG&E. The SCE 1MW project is the way to quantify the risks, before moving to 10MW then on to 100MW. Without these risks quantified and apportioned, investors who are willing to shoulder all of the risks for a meager reward must be found.

5. DISH/STIRLING IS A PRE-COMMERCIAL TECHNOLOGY

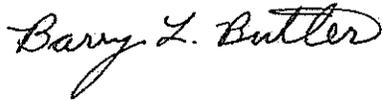

The San Diego Regional Renewable Energy Study Group addressed dish/Stirling in its August 2005 *Potential for Renewable Energy in the San Diego Region*.⁵ Several of the co-authors of this report are SDG&E staff. Dish/Stirling is identified as pre-commercial in this study, based primarily on analyses conducted by the National Renewable Energy Laboratory and Black & Veatch.

I concur with this assessment in the *Potential for Renewable Energy in the San Diego Region*. My opinion is that dish/Stirling technology holds much promise. By 2020, the technology could be a significant player on a commercial scale in the concentrated solar power category. However, there is no possible way that dish/Stirling solar can move from high cost prototype models with substantive reliability concerns to large-scale production of high reliability low-cost commercial models by 2008 and full operation of a 12,000 dish, 300 MW array by the end of 2010. An entire step wise development 1MW, 10MW, 100MW with installed cost, reliability and operation & maintenance costs assessed over a year of operation at each step is necessary to move

Testimony of Dr. Barry Butler on Dish/Stirling Solar Technology

from current prototypes to the large-scale commercial plants contemplated in the power purchase agreements between SDG&E and SES.

I declare under penalty of perjury this testimony and attachment are, to the best of my knowledge, true and correct.

PROFESSIONAL SUMMARY

Dr. Butler has lead nationally recognized teams in solar materials technology for US/DOE, and solid rocket motor propellant to case bonding for NASA. In addition to guiding the national teams and managing the work, he also represented the teams' work to the legislature and Executive branches of government to illustrate their importance.

Dr. Butler is a material scientist with training in the structure property relationships of metals, ceramics and polymers. Dr. Butler has contributed to the basic understanding of carbon/carbon and carbon/polymer composite materials. His research on the optical properties of low cost, lightweight optical structures has helped to relate material properties to system performance. Dr. Butler developed the laser ray trace optical evaluation technique for determining the slope errors of new and available solar concentrators. He guided the development of the solar thermal technology at Solar Energy Research Institute (SERI) which included major advances in stressed membrane heliostats and direct absorption thermal receivers.

As manager of SAIC's Energy Products Division he has managed the design, fabrication and deployment of five 25 kWe dish/engine power systems. Each 114m² reflector weighs 18,000 lbs., and are capable of self-deployment. Dr. Butler holds nine patents and has one pending patent application for the self-deploying advanced drive.

As the manager of the NASA Solid Propulsion Integrity Program (SPIP) Bondline work package of Science Applications International Corporation (SAIC), he was responsible for evaluation of materials and processes to improve the reliability of space shuttle solid rocket motors. Large composite glass/graphite epoxy solid rocket motor cases were health monitored and verified during manufacture, cure and pressure test. He was responsible for managing research and development and enhancing innovation and engineering applications of activities. The NASA SPIP program's \$70M effort was documented on a CD-ROM database a first for NASA. He is active in both the Solar Energy Industries Association (SEIA) and congressional liaison work for solar and aerospace activities.

As the manager of the Energy Projects Division at SAIC, he has played a major role in the development of electro-chemical battery systems and membrane heliostat technology. He has planned and expanded SAIC's battery systems development to include sodium sulfur cells for utility load-leveling and electric vehicle applications and other advanced cells and systems for aerospace applications. He planned and expanded SAIC's advanced solar concentrator area to include design, fabrication and testing of advanced heliostat and dish systems to meet customer needs. He has moved to extend both heliostat and dish technology into small, lightweight modular systems capable of acquisition by a broader range of customers. As Vice President of the Solar Energy Industries Association (SEIA) during 1995 and President during 1996, he drafted the SEIA Strategic Plan and prepared congressional testimony on solar thermal technology representing the industry to congressional committees. He supported the Department of Energy (DOE) solar Thermal Five Year Plan and represented industry to the Office of Management and Budget (OMB) on solar funding issues.

As a research manager at SERI, he guided the research of 90 scientists (\$15 million annually) on solar materials, heat and mass transfer, and thermal systems. Building heating and cooling, ocean thermal energy conversion, solar thermal electric and industrial process heat programs have also been under his direction. Dr. Butler has set the pace in advanced lightweight solar collectors with two patentable concepts. He has also recognized and supported significant advancements in materials and designs from his research staff. He has defined, packaged and sold research programs based on these concepts. Several programs have resulted in commercial products.

He has developed research management skills which allow creativity and technical freedom, while maintaining tight cost and schedule control to ensure quality and timely technical outputs. He is multilingual, has traveled internationally for the Fulbright Foundation, and has lectured on solar materials.

EXPERIENCE

Started Butler Sun Solutions-2002-Present

He runs the solar manufacturing operation for patented solar assisted hot water system. They also perform contracted services to support large 160 m² advanced tracker drives for commercial solar companies. They also are doing engineering management and configuration control for the 250,000 gallon per day desalination plant for the City of Avalon, on Catalina Island, CA, in conjunction with Southern California Edison.

Manager, Energy Products Division for SAIC, 1996- 2002

Dr. Butler ran the United States Department of Energy Dish/Stirling Joint Venture Program. A \$36 million 50/50 government industry cost share program to develop and deploy dish/engine systems. To date, three systems have been deployed and are operating at design levels.

Manager, NASA Solid Propulsion Integrity Program Bondline Division for SAIC, 1989-1996

He was a major contributor to the SAIC proposal and designated as the program manager for the \$40 million, seven year effort. He staffed and set up the Bondline Program offices in San Diego, California, and Huntsville, Alabama. He managed ten SAIC staff and \$5 million annually. He managed the Bondline team consisting of six major subcontractors; Thiokol, Hercules, United Technologies (CSD), ARC, Lockheed Martin, and Aerojet. His division managed the cost, schedule, and technical content of the program. He was responsible for overall customer (NASA) satisfaction.

Manager, Energy Projects Division, Science Applications International Corporation, 1984 – 1988

He started the energy Projects Division which has grown to include 10 staff members and \$1.2 million in annual sales while meeting both growth and profit objectives. The division performs research on point and line focus solar collectors, advanced electrochemical storage batteries and chemical conversion of phosphogypsum to sulfur. He managed systems research and simulations as well as hardware development and testing. He has motivated his division staff to be creative and achievement-oriented, which has enabled business growth.

Manager, Solar Thermal and Materials Research Division, Solar Energy Research Institute, 1982 – 1984

As the manager of the Solar Thermal and Materials Research Division, he directed the activities of the division and developed new technical initiatives, management policies, and operating procedures. He was responsible for managing the Solar Thermal, Passive, Active, Buildings, Conservation and Ocean Programs. Specifically, he managed four research branches: Thermal Research, Materials Research, Thermal Systems and Engineering Research, and Buildings System Research. The division totaled 90 people and \$15 million in research funds annually.

Manager, General Research Division, Solar Energy Research Institute, 1980 – 1982

Dr. Butler managed the General Research Program (\$10 million and 60 staff) which included basic research tasks in photochemistry, photoelectrochemistry, remote sensing of solar resources, university grants (26), sabbatical and summer intern programs, nondestructive evaluation, optical materials and containment materials research. He instituted research reporting of technical progress and cost control on a monthly basis

Chief, Materials Branch, Solar Energy Research Institute, 1978 – 1980

Dr. Butler built and managed the Materials Branch from a staff of four to thirty people supported by a budget of \$3 million annually. He developed the facilities and equipment needs of the branch. He conceived and implemented the Solar Optical Materials Planning Committee composed of representatives of Sandia Lab Albuquerque, Sandia Lab Livermore, Jet Propulsion Lab, Los Alamos National Lab, Battelle Pacific Northwest Lab, Lawrence Berkeley Lab, National Bureau of Standards, and SERI. The committee publishes a set of National Solar Materials Planning Recommendations in five reports which have been followed by the DOE research program.

Solar Materials Coordinator, Sandia National Laboratory, 1975 – 1978

Dr. Butler coordinated the materials and process support of Solar Total Energy, Central Receiver and Photovoltaic projects. This included development of advanced collector testing based on laser ray tracing, materials research on the outdoor durability of wood and composites and life testing of this glass, wood, and composites. Large-scale materials field testing and hail damage test facilities were also part of his responsibility.

Member, Technical Staff, Sandia National Laboratory, 1969 – 1975

He conducted research and published work on advanced carbon/carbon structure property relationships. This research formed the basis for process changes which supported five successful test flights of

carbon/carbon heat shields. Thermally induced strains and stresses up to 2800°C were studied and modeled to determine composite behavior under transient thermal loading. Carbon fiber felts and filament wound performs were densified by chemical vapor deposition and carbonized pitch matrix methods. Nose tips heat shields and thermal insulation systems were fabricated and studied. Dr. Butler taught the bell Lab Composite Materials course and was the lab expert on glass carbon and aramid fiber interfaces with epoxy, polyester, metals and ceramics.

TECHNICAL EXPERTISE INCLUDES:

Business management to meet profit and revenue goals
Technical management of large research groups and projects \$10 - \$15 million and 100 staff members
Structural design, analysis, and fabrication of fiber/matrix composites
Composite materials design, fabrication technology, and tooling expertise

DOCKET 08-AFC-5
DATE _____
RECD. DEC 30 2008

I want to go on record as being opposed to the Solar Two Project being sited in Imperial county, Ca..

Reasons:

Air Quality, We have terrible air quality, one of the big problems is dust, This project would put alot of additional dust in the air. We have a high rate of aslhma-, elementary school children have a 40% rate of asthma compared to the coast with a rate of 15-18%. (info. from American Lung Assoc.)

Water Use

Octillo Sit on a aquifer that contains drinkable water. This water has already been used alot by Plaster City for the manufacture of wallboard. To allow this water to be user for industrial purposes is crazy as drinkable water is a iincreasingly scarce resource.

Clean up Costs

Sterling Energy Systems is a LLC, A bond for clean Up and restoration of the site needs to be posted, or else Imperial County is going to be stuck with a clean up bill or a junkyard that extends for 6000 acres. The amount of the bond needs to be established after aprocess that names a accurate figure for this. Also the amount of financing currently promised is woefully inadequate for this project. We currently are in a increasingly unstable economic era worldwide where all bets are off.

New Technology

Thin-film PV is becoming more competitive has the technology is rapidly improving. I think its going to go like computers have with expotential growth and innovation. This will enable a localized and decentralized solar power plants making the Solar Two Project obsolete.

SUBJECT: PUBLIC INPUT AND COMMENTS ON SES SOLAR TWO (08-AFC-5)

Since the main thrust for the permitting of this project seems to be directed at environmental, cultural and land use issues, I will address my concerns here with follow-up on the reason for these concerns based on the non viability of implementing this mega scale project as proposed by SES. Please enter these concerns with their backup information as public inputs to be addressed by the California Energy Commission.

1. Since thousands of acres of public land are going to be dedicated to this solar energy project, what are the implications of taxpayer responsibility for SunCatchers removal and remediation of the land should a failure of the technology implementation occur? Such a cleanup effort even in the first phase would cost hundreds of millions of dollars, while SES Solar Two, LLC would declare bankruptcy and abandon the site.

2. As I understand it, the justification for the Southwest Power Link is to carry several hundreds of MW from the SES Solar Two Project to the San Diego region. If SES Solar Two fails, as it now stands Sempra Energy is under no commitment to carry other renewable energy sources and is free to carry energy from coal or gas fired plants in Mexico. This appears to have been an ulterior motive in Sempra's pushing for the Southwest corridor while demanding approval without a definite commitment to use this line for renewable sources of energy.

PROBLEMS FACING SUCCESSFUL IMPLEMENTATION OF SES SOLAR TWO "SUNCATCHERS"

1. Stirling Cycle engines have been around for something like 175 years with only a few actually placed in useful operation. The concept is proven, the realization isn't!
2. Philips, auto manufacturers and others have spent millions of dollars trying to adapt Stirling Cycle engines for commercial markets, but without success.
3. SES Solar Two engines operate at very high temperatures, pressures and rotary speeds using hydrogen gas as the transfer medium, all creating long term problems with metal creep, metal fatigue and seal integrity.
4. The SunCatchers have not been tested in the actual harsh environment of the desert with only six units being run by Sandia Labs at their Albuquerque, NM site, with a few others being run by Boeing in the Los Angeles area.
5. As I understand the status of the SunCatchers, the final design is nearing completion with release in early 2009. So none of these units has been built yet, and certainly will not be tested until late in 2009. How can any rational decision be made at this time to site 12,000-30,000 of these units on public land based on current evaluation data?

6. I do not know of any other successful project of this magnitude that has advanced from several units to tens of thousands of units in a single step.

PLAN FOR SUCCESSFUL IMPLEMENTATION OF SES SUNCATCHERS

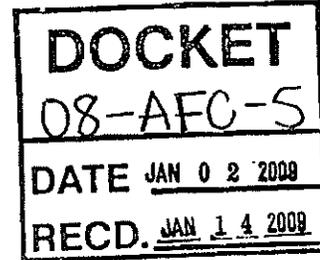

1. Permit SES Solar Two, LLC to construct and test a 1 MW setup comprising 40 SunCatchers on their privately held lands near Plaster City, CA. Run these units for six months to a year, tabulating collected energy, operational availability and operating costs to determine project viability before proceeding to a larger model to be sited on public lands.
2. This approach will in the long run be beneficial to both the U.S. taxpayer and to SES Solar Two, LLC.
3. Defer construction of the Southwest Power Link until a legitimate need is established for its use based on bringing renewable energy from Imperial County to San Diego..

SUBJECT: PUBLIC INPUT AND COMMENTS ON SES SOLAR TWO (08-AFC-5)

I fully agree with the concerns of fellow San Diego County resident Mr. Richard A. Ayers, engineer, when he asks "since thousands of acres of public land are going to be dedicated to this solar energy project, what are the implications of taxpayer responsibility for SunCatchers removal and remediation of the land should a failure of the technology implementation occur? Such a cleanup effort even in the first phase would cost hundreds of millions of dollars, while SES Solar Two, LLC would declare bankruptcy and abandon the site.

The SunCatchers final design is nearing completion with release in early 2009. This means that none of these units have been built yet, and certainly will not be tested until late in 2009. How can any rational decision be made at this time to site 12,000-30,000 of these units on public land based on current evaluation data?"

The current economy in the United States dictates that large financial commitments are looked at with a "common sense" point of view. The bottom line should be to make sure that a product's final design is first completed – and then tested in the environment it is planned to be used – that of sand storms and the "white ground fog" from Plaster City. These tests, of course, should be conducted on privately owned property – not public lands.

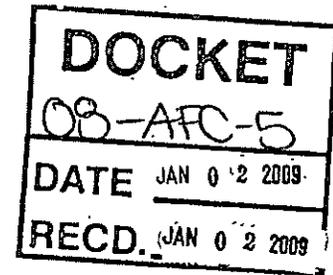

I add my voice with Mr. Ayers' when he requests that these units be "run for six months to a year, tabulating collected energy, operational availability and operating costs to determine project viability before proceeding to a larger model to be sited on public lands."

Re: 08-AFC-5: SES Solar Two

Mr. Meyer,

As I understand it, this process is to decide whether to site the Stirling Energy Systems (SES) Solar Two Suncatcher project on over 6000 acres of public lands in the El Centro area.

The involvement of public lands makes the evaluation of the viability of this unproven technology the major sticking point of this proposal. Six thousand acres will be permanently "disturbed."

I tried to find current technical information online for the Solar Two Suncatcher project at Sandia Labs. The only information available was produced by SES.

I thought that as a public-private partnership the technical reports and studies of this ongoing research and development would be public documents. I was wrong.

Dr. Tom Mancini, Program Manager, Concentrating Solar Power, Sandia National Labs, told me that since SES was providing the larger share of money for this project (\$100 million (SES) to \$1 million (Federal)), SES controls the information. None of the work done on the most recent research and development of the Solar Two Suncatcher (2001 to present) was available to the public.

This is a BIG problem in attempting to assess the viability of this technology.

I don't think the Energy Commission can make an informed decision on this without an independent assessment of the technology. There is no way to do that with SES as the sole source of information.

At the November 24, 2008, CEC hearing there were concerns about how the mechanical parts, mirrors, and seals would perform in the sand blown environment of Plaster City. The SES representatives were quick to reassure everyone that those issues had been successfully addressed and resolved. They expected that to suffice. It doesn't.

When Dr. Mancini and I talked on the phone, he expressed surprise that SES was promising such a rapid deployment of the Solar Two Suncatchers from 6 units at Sandia

to 12,000 in the field by 2010-2011. He stated that the latest iteration, the final design, of the technology was just being installed; the new pedestals for the four units going in as we spoke. He predicted that it would be three years before the technology would be commercially available.

I'm pretty sure that SES made some sweeping promises at the November 24, 2008, hearing about getting 12,000 Solar Two Suncatchers up and running at Plaster City by 2010-2011.

As nice as the SES folks might be there is no reason to trust them to tell the truth about the Solar Two Suncatcher technology. It's a business. They need investors with large amounts of cash and they need a place to put the Solar Two Suncatchers.

Sandia Labs, no matter how righteous and above reproach they might be, cannot provide a stand alone independent analysis for two reasons: (1) contractually they can't; and (2) there is the \$100 million that they are being paid which may skew their view of things.

I am including the email string between Dr. Mancini and I which may suggest other and/or clarify some issues. It starts with my request for public information. There is a telephone conversation between us and two follow up emails regarding that phone call.

Sincerely,

Charlene Ayers

Hello Mrs. Ayers,

Thanks for the kind comments. I enjoyed visiting with you as well.

I would like to clarify a couple of points.

First, when I made a presentation to the group reviewing the Sunrise Power Link project, it was clear that SDG&E and the environmentalists and the NGO community had already had major issues. During our meeting, they did not seem to me to be at all receptive to discussions on several issues raised by the remaining groups.

Second, my comment related to the Solar 2 Project, was that I believed, based on information provided by several different parties, that there was sufficient existing transmission capacity for the initial phase of the project (~300 MW). However, as I explained, I've also heard that SDG&E plans to develop more of the geothermal resources in the Imperial Valley, which would require additional transmission capacity.

Last, while we do share a lot of information with SES, they do not keep us informed of their deployment plans and strategies. Over the course of the past year, their strategy has changed several times and, while I may have been surprised that they intend to deploy 12,000 systems during the next year, it is not at all unreasonable to think that they could do it.

Again, I very much appreciate folks like you and your husband, activist citizens who track civic activities and make sure that things are being done for the right reasons.

Best Regards,

Tom

Subject: RE: STIRLING ENERGY SYSTEMS DEVELOPMENT WORK

Dr. Mancini...

I was pleasantly surprised by our conversation yesterday. I am glad that you insisted on it.

As you surmised, my attempts to get information on the SES Solar Two Suncatcher technology were motivated by SDG&E's plans for the Sunrise Powerlink. They are

citing the SES Solar 2 project as the reason for it all.

I was interested in your comments about their involvement. It sounded like the SES Solar Two Suncatcher technology could do very well by itself without any help by SDG&E.

I believe your comment was that when you came out to make a technical presentation on this technology, you were put off by SDG&E's hijacking of the SES Solar Two Suncatcher technology, adding that they drove all the NGOs off.

Although, not a transmission expert, you thought that SDG&E could handle the all the energy produced by SES Solar 2 project by expanding their existing lines.

After my husband (Lehigh-Engineering Physics '53) and I attended the last California Energy Commission's hearing (Nov. 24, 2008) on the SES Solar Two, we thought that a test group of 100 units sited at Plaster City would be a good research strategy.

According to SES's presentation at the hearing, they intend to go from the 6 units at Sandia Labs to 12,000 in the first phase. That doesn't sound very scientific to us.

In our conversation yesterday, it sounded like this was the first time you had heard of these plans, and you were a bit skeptical of that timeline.

SES also stated at that hearing that they would have those first 12,000 units at Plaster City up and running by 2010. I think that you said that it would take 3 years more to make the technology commercially ready, and that would be with the new design (4 units) being set up for evaluation as we speak.

Mr. Liden, VP SES, stated to us directly as he was working the room before the November 24, 2008 hearing that the investment breakdown was government \$1 to SES's \$5. He urged us to see what a good value that was.

As per our conversation, the investment breakdown is government \$1 million and SES \$100 million and whenever the commercial partner puts in more money than the government, the commercial enterprise controls all the information because of the proprietary issues. That would be why there are no public documents available, and why all the news releases have that SES spin.

The once-in-a-blue-moon conditions under which the award winning "Popular Mechanics" test was conducted was a media event orchestrated by SES. You reported that the actual annual overall performance of the Solar Two Suncatcher technology is 24% which is still pretty good. You pointed out that a single solar cell has 38.1% efficiency but when put into an array the efficiency drops to 20%.

Here's the link to the report "Status of the Boeing Dish Engine Critical Component Project (Jan 1999)" that my husband found online:

http://www.osti.gov/bridge/product.biblio.jsp?osti_id=3273

Thank you for the "SCE Dish Report" from 1993. It looks to be very comprehensive.

Charlene Ayers

----- Original message from "Mancini, Thomas R" <trmanci@sandia.gov>: -----

Hello Mrs. Ayers,

I enjoyed visiting with you earlier today. As I noted in our discussion, there are a number of issues around the Sunrise Power Link transmission line with which I do not necessarily agree. Also, as your husband rightfully noted, defining a point performance metric under "best conditions" is not really a fair way of characterizing the annual performance of a system. But, of course, we weren't trying to characterize this as anything other than what it is – a high level of performance under best conditions.

Attached to this message is the early performance paper for the pre-cursor to the SES system. To a first order, the performance reported in this paper fairly represents that of the current design.

Best Regards,

Tom

Dr. Mancini...

I, too, am sorry for the mix up. I'm not looking for a chat on this technology (SES-Solar Two Suncatcher).

I am looking for public documents on the testing and research that describe the methods and conclusions.

Please direct me to where I can view those technical documents.

Charlene Ayers

Hello Ms. Ayers,

Your note to Tom Hunter was forwarded to me for response.

I apologize for the misunderstanding. Unfortunately, I never received your original email message because Mr. Sanchez must have forgotten that my email address includes my middle initial (i.e. trmanci@sandia.gov). I would very much like to visit with you about Stirling Energy Systems' development work and our support of it here at Sandia. Our group is very excited about the expansion of Concentrating Solar energy projects in Southwest and we are working hard to support them all.

I have your telephone number and will call you later today to schedule a time when we can have a more extended discussion.

Best Regards,

Tom

SCOPING COMMENTS: SES SOLAR TWO PROJECT, DOCKET NO. 08-AFC-5

Dear Mr. Meyer,

For the record, I have attended the July 24, 2008 Imperial County Planning and Development Services Pre-Application Meeting for Stirling Energy Systems, the November 24th CEC/BLM Informational Hearing and Scoping Meeting and site-visit, and the December 18th CEC/BLM Data Response and Issues Resolution Workshop and Scoping meeting. SES/URS also provided me with a DVD and hard copy of the Response to CEC & BLM Data Requests 1-52. As requested at the December 18th meeting, these comments are being sent directly to you and not to the BLM. Even though I am an elected land use representative for the rural Eastern San Diego County community of Boulevard, and the President of the public benefit non-profit group, Backcountry Against Dumps, these comments are my own. I am a property owner and taxpayer in both San Diego and Imperial Counties and a ratepayer that will be impacted by the massive and wrong headed SES Solar Two Project, the Sunrise Powerlink (deemed unnecessary and too environmentally and fiscally expensive by the CPUC's assigned Administrative Law Judge), Iberdrola Renewables 200 MW Tule Wind Project on approximately 20,000 acres of BLM land in Boulevard's McCain Valley Land Cooperative and Wildlife Management Area, and other questionable industrial scale renewable energy projects and related infrastructure—if they manage to come to fruition.

Large scale urban PV is more cost effective than remote solar and wind projects and the related Sunrise Powerlink

The CEC and BLM should reject the Solar Two Project and other such controversial behemoths as they do not represent the best and highest use of our public lands or the best interest of ratepayers and tax payers who will be forced to bear the economic burden of the resulting exorbitant rate increases and inflated taxpayer funded subsidies—not to mention the extensive and cumulative loss of use of our public lands and recreation areas to unnecessary energy and transmission projects. It is especially troubling and irksome when foreign entities will be reaping the rewards at our expense, with much of that tax and rate payer funded booty being spent outside the US and very little being spent within the impacted communities.

On-site and close to point of use renewable energy projects are far less destructive, expensive, and time consuming in regards to approval and litigation, and they do not require the destruction of public lands or extensive and vulnerable transmission lines. Bill Powers, PE, Powers Engineering, an intervener in the CPUC/BLM CPCN case for the Sunrise Powerlink (App. 06-08-010) provided some compelling research and backup documentation in a December 12, 2008 Ex Parte Communication. Powers' research shows that it would be cheaper to build 1,000 MW AC of thin-film PV in the urban core than to build the 1,000 MW Sunrise Powerlink. With a few adjustments, the same applies to the \$1.4 billion 750 MW SES Solar Two Project, especially when you add in the projected \$1.9 billion cost of Sunrise Powerlink and the necessary IV Substation upgrades and expansions for both Phase I and II of Solar Two. I have attached the 44-page Powers Ex Parte Communication (12-12-08) and hereby incorporate his information into the record.

I am also incorporating, by reference, the entire record for the Sunrise Powerlink case noted above, and all of the commentary, criticism, research and testimony that relates to the SES Solar Two Project contained within that record. That extensive record includes much more from Bill Powers along with especially relevant comments from the Utilities Consumer Action Network (UCAN), the Conservation Groups (CBD & Sierra Club) represented by attorney Steven Siegel, and all of their witnesses. I also hereby incorporate by reference Bill Powers Smart Energy 2020 plan (October 2007) which is also part of the Sunrise Powerlink CPUC/BLM project record. UCAN has already announced that they will appeal the CPUC's controversial December 18th approval of the Sunrise Powerlink using the extensive record and the Assigned ALJ's denial of the project based on that record. A similar suit is expected from the Conservation Groups.

SES's troubling responses to questions about their Solar Two Project

During the bus ride for the November 24th Solar Two Project site visit, SES's Robert Liden provided the following answers to questions posed by myself and others:

- Stirling Energy Systems has just \$100 million of the \$1.4 billion needed for the Solar Two Project.
(NTR is proposing to invest another \$100 million but that is still a mere fraction of what is needed)
- Equity funding is for the pilot project and manufacturing only. Their Imperial Valley Solar Two project is not funded.
- The 5-year accelerated depreciation rate is attractive to investors as are the renewable energy credits. Yet, when they talked to investors in San Diego prior to the November 24th hearing, none signed on.
- The SES solar engines are still in the research and development stage and they are *looking at* federal loan guarantees for innovative renewable energy concepts.

- SES will be adding another 4 *hand made* units at Sandia Labs to incorporate some changes in engineering needed for mass production. Their 6 existing units were installed at Sandia 3 years ago.
- They are still working with a Michigan plant on potential manufacturing of the solar engines. (An article in the San Diego UT on 12-14-08, reported that SES plans to have Linamar, a Canadian automotive products company produce the first engine mid-January, test it, and then enter full production by the end of next year).
- They may have a portable factory on-site for assembly of Sun Catcher units. (If so, where will it be located, how big will it be, and what are the impacts associated with that facility?)
- In response to a direct question about how they will deal with and mitigate the fact that the BLM project site is currently designated as a Limited Use (protected) Area with traffic restricted to the few existing routes of travel, *Liden ignorantly stated that the Limited Use designation meant the land had limited uses and was not good for much.* A corporate executive, looking for public support and the virtual gift of 10-square miles of public land, should have better knowledge of and respect for the land that belongs to the American people.
- They had to move their Solar Two Project boundaries due to significant cultural and historic resources and more may be found. (most associated with the Ancient Lake Cahuilla shoreline, artifacts, cremation sites, and sacrifice areas as noted by Carmen Lucas and the archeologist with Imperial Valley Museum).
- The entire project perimeter area (10-square miles) will be fenced off, as phases progress. OHV trails will be closed and motion activated lighting will be installed. (These impacts, alone, are significant and will completely alter the existing character and appeal of the desert landscape and habitat.)
- The SunCatcher units reportedly close automatically when winds exceed 35 mph. So, where are the onsite anemometers (MET towers)? It generally takes a minimum of three years to properly analyze the average wind speed and the frequency and intensity of wind storms. To a rational person, legitimate site specific wind information would seem to be necessary in order to determine the amount of down time for the SunCatcher units related to wind and dust storm events. Too much wind would translate into too much down time, the potential for sand damaged equipment (mirrors, gears and engines), and reduced power generation—all critical information.

Transmission / Sunrise Powerlink / IV Substation connection Phase I and II

During the same site visit bus trip, Liden provided the following information in response to

questions:

- The Solar Two Project is # 1 in the CALISO queue to connect to the Imperial Valley Substation for the 300 MW proposed for Phase I.
- Several hundred million dollars will be needed to upgrade the IV Substation for Phase I.
- For the 450 MW Phase II, they are # 4 in the CALISO queue for the inter-tie to the proposed IV Substation expansion and the yet-to-be-built Sunrise Powerlink transmission line.

The three big transmission questions are:

- Is there really any remaining capacity on the existing Southwest Powerlink to accommodate the proposed 300 MW of Phase I of Solar Two, beyond the current 80 MW of capacity reported by CALISO and as claimed by Sempra Energy in their April 2008 amendment to their DOE Presidential Permit Application (PP-334) for a new 500 kV transmission line at Jacumba in Eastern San Diego County? Sempra alleges that their new cross-border line is needed to accommodate their 1,250 MW La Rumorosa Wind project, and to connect it to the Sunrise Powerlink. The La Rumorosa project has also been referred to as Baja Wind and more recently as Energia Sierra Juarez. (See Sempra project information at: <http://www.semprageneration.com/esj.htm>).
- What are projects # 1, 2 & 3, which are ahead of Solar Two Phase II, in queue for the expanded IV Substation and Sunrise Powerlink transmission project, and what capacity, if any, will be left on the Sunrise Powerlink for the proposed 450 MW of Phase II of Solar Two?
- What are the alternative means of transmission in the event there is no available capacity on the existing Southwest Powerlink for Phase I, and /or legal challenges overturn the CPUC approval of SDG&E's highly controversial Sunrise Powerlink project?

American and local jobs

SES representatives repeatedly use the lure of jobs for American and Imperial Valley workers as a reason to approve their Solar Two project. At public hearings in the Valley they talk about all the green collar jobs that will be generated. Unfortunately, the reality will be the importation of already trained workers from elsewhere in the country with very few high paying jobs going to local Valley workers. There is also the very real potential for skilled and unskilled Green Card workers to be brought in from both Mexico and foreign countries to fill the few jobs that will be available. SES has also promoted the project by talking about the American auto workers that will be put back to work building Stirling Solar engines, *but* the San Diego UT just reported their deal with Linamar, a *Canadian* automotive products company.

Visual Resources

It was reported that there will be virtually no reflection impacts to passing motorists on I-8 and Navy, US Border Patrol, other air traffic flying in the designated corridor overhead, from the 30,000 mirrored dishes as all light will be deflected. Pilots will reportedly see a gray area. This is rather hard to believe and needs to be verified, especially with the number of potentially impacted drivers on both east and west bound I-8, Dunaway Road, and Evan Hews Hwy, along with the heavy air traffic associated with the Navy Air Station located several miles to the east at Seeley, and the frequent low level Border Patrol helicopter and other Homeland Security related flights in the area.

The complete landscape and character alteration that this project represents is significant, massive and cumulative in nature all on its own. The impacts are off the charts when you add in the many other projects that will be highly visible in the same area like Iberdrola Renewables 200 MW Tule Wind project on approximately 20,000 BLM acres located on the ridgeline to the west, Greenhunter Wind Energy LLC (formerly Windhunter) on their 6,250 acres of BLM land just west of Solar Two, and pending applications for up to 5 more MET towers, in the same general area, with potential industrial wind turbine projects to follow, as noted by BLM in their November 2008 FONSI and Decision Record for Greenhunter's 197 foot tall MET Tower ROW.

Add in Sempra's Energia Sierra Juarez (AKA La Rumorosa Wind and Baja Wind) which will cover approximately 60 miles of highly visible ridgeline to the southwest starting at the US Mexico border and Imperial County line, and the Union Fenosa's Zemer Energia's 1,000 MW wind energy project, proposed for the same highly visible La Rumorosa area, with the first 500 MW planned for export to the US via the Imperial Valley Substation and local transmission lines. The attached December 9, 2008 'Motion of Zemer Energia for Party Status' in the CPUC/BLM Sunrise Powerlink proceedings confirms their intent and the fact that they have paid their fees to CALISO. Their motion was granted.

Wind-Zero, another highly visible large-scale community character altering project is proposed on about 1,000 acres of private land between Solar Two and the communities of NoMirage and Ocotillo to the west

Go to pages 17 & 18 of Sempra's September 18, 2008 Power Point presentation link below, which includes maps and references to the 60 miles of Sierra Juarez (La Rumorosa) ridgeline where Sempra and the Union plan to install industrial scale turbines over 400 feet tall:

<http://www.heco.com/vcmcontent/EnergyServices/EnergyExpo/2008Presentations/AllmanAndGuiles.pdf>

Cultural Resources

Carmen Lucas, a well respected Native American of Kumeyaay decent, spoke passionately about the extensive and highly valued cultural resources placed at risk by the Stirling Solar Two project. Lucas said that she was there at the request of the State Office of Heritage Protection. An archeologist with the Imperial Valley College museum also spoke about significant concerns with the cultural and historical resources at risk and the viability of the project site. When you add the impacts from this one project to all the other proposed and existing projects and the approved and illegal uses, in the El Centro Field Office planning area, the CDCA, and other BLM lands in the region, especially for so-called renewable energy and transmission projects, the cumulative impacts are massive and virtually incalculable.

Air Quality Impacts / Dust & Fugitive emissions / Cumulative impacts

The 10-square mile project site and the extent of disturbance to fragile, fine, and sandy desert soils, and the need to run back and forth in vehicles to repeatedly wash the mirrors on 30,000 SunCatcher units, the potential on-site generation and leakage of hydrogen gas, diesel trucks and trains used to deliver equipment, all represent an increased threat of negative impacts to air quality. Add to that the industrial mining and plaster board processing plant at Plaster City, idling diesel train engines and truck, sand mine truck traffic from multiple operations in the area, Plaster City OHV Park and the related OHV traffic and activities, and you have a major problem. It is important to note that disturbed desert soils no longer serve as a carbon sink.

Water Resources / flood plains / Erosion control

SES keeps talking about using approximately 32 acre feet per year of IID water for their project but it is unclear if an agreement has been formally secured and what amount of water delivery is guaranteed over the life of the project. Various maps show numerous channels, desert washes, and flood plains through out the project area. Along with concerns for any alterations of the natural flow patterns on wildlife, habitat and groundwater recharge, there are concerns with the potential for inundation of numerous SunCatchers, and on-site infrastructure during El Nino years and significant storm events like Hurricane Kathleen that roared through the area (1977-78?). I experienced that hurricane first hand. It washed out sections of I-8, the rail road, and a wide swath of the community of Ocotillo all near the Solar Two project area. Several maps provided in the Response to CEC/BLM Data Requests 1-52 show numerous Suncatchers, roads, and more, situated within the identified flood plains. Maps also show "debris basins" located in flood plains. All floodplains and natural drainage channels and washes should be off-limits for any project related installations or alterations. Don't ever underestimate the amount of water that flows in the desert and the destruction it can cause. There are also concerns with the lack of detailed information on the evaporation ponds and the chemical make up and ultimate disposal destination of the resulting waste.

Loss of Use /Quiet enjoyment and recreation/ OHV

The cumulative scale and scope of the loss of use, the loss of recreational opportunities, and the quiet enjoyment of our public lands when millions of acres are practically given away, fenced off, altered and transformed into private profit factories, is virtually off the charts and totally unconscionable. This also applies to the loss of and intrusion into designated OHV parks and routes.

Significant and Cumulative Impacts

Multiple renewable energy, transmission, and other projects, including SES Solar Two, high profile industrial wind turbines over 40 stories tall along western ridgelines on both sides of the US/Mexico border, and more potential wind turbines on BLM lands between Solar Two and the more elevated ridgeline projects, transmission and related infrastructure for renewable energy projects, mining projects, quasi military projects, and more, are currently proposed for over 2 million acres of BLM lands in the California Desert District and Eastern San Diego County, some private lands, and hundreds of thousands of acres in Northern Baja, mostly on communal Ejido lands. Separately and together, these projects will result in the following significant and cumulative impacts and more:

- Community Character and Values
- Loss of recreational and public use
- Loss of quiet enjoyment and sense of time and space
- Industrialization of rural communities and open spaces
- Loss of and damage to Cultural and Historical Resources
- Staggering Visual Resource and skylining impacts
- Landscape transformations and alterations
- Wildlife
- Habitat fragmentation and destruction
- Air quality, dust, and fugitive emissions
- Loss of dark skies (light pollution) and scientific resource value
- Increased traffic during construction, operation and maintenance
- Water resources including groundwater, imported water, and recycled water
- Increase soil erosion
- Diverted and denied recharge to fragile aquifers and sensitive habitat
- Disproportionate social and economic burdens to rural and low-income communities
- Environmental Justice issues
- Loss of carbon sink value of undisturbed desert soils
- Green House Gas emissions from increased project activities and manufacturing processes
- Infrastructure
- Traffic
- Utility rates
- Property Values
- Eminent Domain

BLM Land Appraisal /Rent monies paid to BLM / What are local benefits from rent payments

The appraisal of the BLM land to be used for this project needs to be an open and transparent process, with documents and assessments included in the public review process. The land value needs to include the project sites readily available access to utility transmission lines (both low and high-voltage) and substations, public roads and interstate highway, active rail line access, access to imported water from IID through a minimal pipeline extension (7 miles) from the West Side Main canal, existing industrial uses, US Gypsum's Plaster City, on adjacent land. All of these aspects

make the proposed land much more valuable than other more remote public lands. The lease price should properly reflect those values. What amount of rent money paid to BLM will go to benefit the local BLM lands and /or impacted communities? Or, will all the money go to the general fund as the community of Boulevard was informed when similar questions were asked about the rent monies from Iberdrola's proposed Tule Wind project on BLM land?

Bonding and decommissioning

I agree with the CEC and BLM staff concerns regarding the lack of adequate SES planning and response to questions regarding the funding for decommissioning the project site in the event of bankruptcy or other form of abandonment by the Applicant/Investors. The recent crash in prices for scrap metal and other commodities is part of the cyclical rise and fall of prices over time, and cannot be counted on to pay for the costs of decommissioning, or even to defray the costs. A legitimate and binding bond needs to be secured prior to any project approval or commencement of project activities that will cover any and all decommissioning costs. The tax payers do not need to foot yet another bill for this or any other projects built on public land.

A Better Way

There are far better ways to provide reliable renewable energy at or close to the point of use without this invasive and expensive 10-square mile project and the related and litigious Sunrise Powerlink transmission project. In addition to the previous information provided, please see the attached well researched article "The Better Way" by the Alliance for Responsible Energy Policy. It includes a comparison chart showing the disparity for impacts of point of use renewables and industrial scale wind and solar projects. There is more good information at their website at www.allianceforresponsiblenenergypolicy.com.

December 5th an article was printed in the San Diego Union Tribune regarding the City of San Diego's proposal to allow residents to pay for solar panels through their property tax bills over 20 years (http://www.signonsandiego.com/uniontrib/20081013/news_1n13solar.html). The County of San Diego is considering the same policy. The County also recently supported pursuit of state legislation for feed-in-tariffs for small generators. The Imperial County and IID can and should follow the same path to renewable energy production and independence.

The combination of the new 30% tax credit, being able to pay for solar panels through our property taxes, and the potential to get paid for excess self-generated energy, which is now donated back to the utilities, is the bright future we prefer. This will allow the average citizen, school, church, small businesses, and others to become part of the solution instead of being part of the problem. If feed-in-tariffs are approved (like we enjoyed in the 80's before the utilities killed them), it will also provide a further incentive for us to install a larger solar system than our home or business needs and to conserve energy so that more will be available to sell back to the grid. This scenario could represent the jump start to the real green energy future and green jobs that most people prefer, once they are provided with the facts and the opportunities. It can also help generate much needed extra income for families, communities, and organizations during these difficult economic times.

Conclusion

The rush to embrace massive and unnecessary projects like Stirling Energy Systems Solar Two, the Sunrise Powerlink, Iberdrola Renewables Tule Wind project, Sempra's La Rumorosa Wind project (in Mexico), and others throughout the region, should be compared to the rush to deregulate the energy market, to promote massive Ethanol production from corn, and to add MTBE to our gasoline which contaminated groundwater resources. All of these poorly vetted decisions resulted in incredibly expensive debacles with far reaching and unintended consequences that even the best minds have struggled and failed to fix. The old saying '*act in haste and repent at leisure*' applies to this and other decisions before you. Please deny the Application for Certification, for SES Solar Two. This very controversial project represents yet another incredibly expensive debacle with far reaching and unintended consequences. Now is not the time to further burden struggling ratepayers with billions of dollars that will be paid for through massive rate increases—there is a *better way*, and we are counting on you to help us get there.

Sincerely,

Donna Tisdale

September 10, 2008

POWERS ENGINEERING NOTICE OF EX PARTE COMMUNICATION

On September 4, 2008, from 10 to 11 am at the offices of Powers Engineering in San Diego, Bill Powers, P.E., principal, Powers Engineering, met with Thomas Del Monte, intern to Commissioner Bohn. Communication was oral and written.

Mr. Powers addressed the rapid evolution of thin-film PV and the fact that thin-film PV is now demonstrably the lowest cost, on a \$/MWh basis, of any commercially available solar energy technology. He noted that Sempra Energy had announced plans to install 100s of MW of thin-film PV at its power plants in Nevada and Arizona. He also addressed the pre-commercial nature of dish Stirling technology. Mr. Powers expressed the opinion that the considerably higher \$/kWh rate by the utilities for on-peak point-of-use PV compared to the market price referent (MPR), and the: 1) lack of need in urban/suburban locations for new transmission to serve this generation, 2) lack of significant T&D losses, up to 14% at peak, associated with remote generation, 3) the presumed CEQA exemption for PV arrays on existing rooftops and in existing parking areas, and 4) the lack of need to dedicate any new urban or suburban land to develop the PV capacity (as it would on existing rooftops and parking areas), makes saturation deployment of PV in the urban/suburban core the most financially sound strategy for PV development, not large-scale development of PV (or any other solar technology) at remote sites dependent on new transmission to serve load centers. Mr. Powers also provided Mr. Del Monte with the following documents:

1. June 26, 2008 ex parte meeting notification of meeting between Bill Powers and Commissioner Bohn staff in San Francisco (with attachments). This notification with attachments was served on all parties to the A.06-08-010 proceeding on June 26, 2008.
2. June 27, 2008 ex parte meeting notification of meeting between Bill Powers and Commissioner Bohn staff in San Francisco. This notification includes additional documents provided to Commissioner Bohn staff at the ex parte meeting (with attachments). This notification with attachments was served on all parties to the A.06-08-010 proceeding on June 27, 2008.

3. August 11, 2008 UCAN protest submitted in proceeding A.08-07-017, Application of San Diego Gas & Electric Company (U 902 E) for Approval of the SDG&E Solar Energy Project.
4. June 1, 2007 A.06-08-010 Phase I direct testimony of Dr. Barry Butler.
5. E-mail print-out summarizing Sempra Energy plans to add 100s of MW of thin-film PV at Sempra power plants in Nevada and Arizona, and Renewable Energy World August 20, 2008 article titled "Creating Realistic Expectations for Renewable Energy". The article includes a case study of dish Stirling solar technology.
6. Summary of transmission capacity serving California and U.S. and California transmission maps.
7. Sept. 4, 2008 e-mail from Bill Powers to Thomas Del Monte with links to the Renewable Energy Transmission Initiative draft Phase 1B report and the 2007 Integrated Energy Policy Report.

The last three documents are included as attachments to this notice. In addition, Mr. Powers committed to provided Mr. Del Monte with a hardcopy of *San Diego Smart Energy 2020*. *San Diego Smart Energy 2020* describes a distributed generation alternative to the Sunrise Powerlink and is a part of the A.06-08-010 record.

For a copy of this notice, please contact Bill Powers, P.E. at (619) 295-2072 or by e-mail at bpowers@powersengineering.com.

Respectfully submitted,

/s/ _____

SDG&E parent Sempra just committed to a legitimately low-cost commercially proven solar technology, 10 MW of First Solar thin-film PV at the Boulder City, NV site of Sempra's 480 MW El Dorado combined-cycle plant. The project is supposed to be operational by the end of the year. Sempra says it will add 40 to 50 MW of thin-film PV to the project next year. Sempra criticizes solar thermal in the attached Reuters article, saying thin-film PV is the way to go. Sempra indicates it also wants to build 300 to 400 MW of thin-film PV in Arizona. There is no mention of dish Stirling anywhere in the article.

SDG&E says it will add 35 MW of high cost tracking PV in the San Diego area over 5 years under the solar project the company proposed to the CPUC in July 2008. Why is SDG&E implying it is a stretch to add 6 or 7 MW of PV per year when parent Sempra is committing to 10x as much solar per year now at one site using a much lower cost PV technology (fixed plate thin-film PV)? The 300 to 400 MW of thin-film PV in Arizona mentioned by Sempra implies the company sees no hurdles to installing cost-effective PV at a rate of 100s of MW per year.

Sempra also states there is a land rush going on and it is getting tougher to find good sites on transmission lines. What Sempra does not say is that there is an almost unlimited amount of disturbed land, aka commercial rooftops and parking lots, in California and Arizona urban areas where thin-film PV could be sited with no transmission requirements and no land acquisition costs (or CEQA issues) along the lines of the SCE commercial rooftop PV project in San Bernardino and Riverside.

I know I have already sent this, but it is a wonderful juxtaposition to Sempra's born-again commitment to thin-film PV as the solar energy technology of choice. About the last quarter of the Renewable Energy World article (link below) looks at SES dish Stirling as a company creating unrealistic expectations based on untested assumptions about cost and performance.

Bill

Creating Realistic Expectations for Renewable Energy

by Stephen Lacey, Staff Writer

August 20, 2008 - New Hampshire, United States

It's a delicate time for the renewable energy industry. Now that the public eye is focused more intensely on clean energy technologies, there are a lot of high expectations about their potential. Properly educating consumers, investors and journalists about what each technology can realistically offer will be one of the most important factors in moving renewables forward, say industry professionals.

At the consumer level, that means encouraging buyers to do the necessary research about the product they're purchasing and the company they're working with. If buyers don't really know what they are getting, that could make for a less-than-satisfactory experience < or even worse, a situation where the customer gets scammed.

Sue Kateley, Executive Director of the California Solar Energy Industries Association, says she sees a growing number of scammers getting into the solar industry who are making overblown claims about energy output and estimated return on investment. In the last few months, she has received three different calls from consumers in California who had large deposits taken from them by sketchy installers who made promises they couldn't deliver.

In two cases, customers put down US \$40,000 for a deposit and never got the system installed. In one case, a customer put down US \$105,840 for a deposit on a system even though they were unsure about the relationship. By the time they had second thoughts about the installer, the contract was signed and the check was cashed.

"In doing some further investigation, it doesn't really look like these are solar companies. It looks like these are opportunists...that are setting up websites and opening an office...and they're just going around and taking advantage of unsuspecting people," says Kateley.

With aggressive solar targets and a robust incentive structure in California, scammers see a big opportunity to take advantage of uneducated consumers, she says. And as other states continue to increase their support for solar, the problem will undoubtedly spread to other states. The only way to stop this from happening, says Kateley, is to teach people how to make smart decisions when purchasing solar or other renewables. That means knowing how to find a licensed contractor, understanding what's in a contract, and most importantly, knowing how solar works.

"I think that anytime you have a lot of government and public attention on going green, people don't know really what that means. And since customers don't tend to do a lot of due diligence themselves, they really are taking on faith that the person who's selling them this product will treat them well. I think that's the problem that I see picking up - the green movement has brought in some snake oil-type practices and that's very sad."

The situation is similar to that of the late 1970's and early 1980's when the booming solar hot water industry attracted a number of scammers who put up shoddy systems. Many Americans lost confidence in the technology and the solar hot water industry still hasn't fully recovered. This time around, scammers in the solar-photovoltaic industry have gotten more hi-tech. The internet has made it easier for people to set up a professional looking website and lure consumers with flashy promotions and complicated jargon.

The residential wind industry is experiencing a very similar issue, says Wind Energy Expert Mick Sagrillo. He sees the same type of scammers setting up websites promoting new vertical axis turbines and publishing theoretical

performance data that has no relevance to the actual output of a system. Many of these devices are untested and are being promoted by people who know they have a questionable technology, he says. If someone buys a poorly-made turbine and it malfunctions, the consumer's problem turns into a public problem.

"When you put a solar system on your roof and it doesn't work, nobody will be able to tell. When you put a small wind turbine on your roof or in your backyard and it doesn't work, the whole neighborhood knows. That could have a lasting effect on someone's opinion about wind. We have to make sure people are making smart purchases so that we maintain confidence in these technologies," says Sagrillo.

The main reason that sham companies are able to thrive, he says, is that people don't really understand energy. If someone doesn't know what type of performance data to look for, the potential for them to get dazzled by overblown or false claims about a technology increases. As founder of the wind-installation company Lake Michigan Wind and Sun, Sagrillo gets a large number of people looking into wind generators because of the rising cost of gasoline. The fact that people equate electricity generation with gasoline shows how uneducated many Americans are about energy, he says.

"It's great that people are looking for alternatives, but it's amazing how little people know when they seek them out. That leaves people open to purchasing a product that is less-than-reliable. We are a very gullible culture, we're always looking for the magic bullet," says Sagrillo.

That magic bullet thinking is spread by the mainstream media, Sagrillo says. Too many journalists take company claims about cost, performance, and project timelines at face value. He believes that lack of critical analysis is passed on to consumers.

Technology Journalist Peter Fairley agrees. If companies are allowed to make claims they can't deliver on, that may damage public confidence in certain technologies, he says. Too often, companies don't release enough information to properly evaluate claims about the economics or energy output of a product.

"It's critical for us to point out when companies are not answering questions. There's a lot of hype around certain companies that are being very secretive and where there's real potential for not only investors to get hurt, but also for the image of the industry...to be hurt."

One of the more secretive companies in the industry has been Arizona-based Stirling Energy Systems (SES). The company plans to roll out

300 megawatts (MW) of its Dish/Stirling systems in Southern California by 2010 for around US \$1.50 per watt. After that, the company says it will scale up to 900 MW, but it has not issued a timeline for the expansion. There are plans for another project which could eventually bring the total installed capacity of Dish/Stirling systems in California to 1,750 MW.

But Barry Butler, an engineer with 30 years of experience with solar thermal electric technologies, says that SES is not being honest about the realities of its proposal. He's worked with Dish/Stirling devices and believes they have a lot of potential. But "to claim that you could do it for \$1.50 a watt, which is just a little more than a gas turbine, it isn't physically possible. You can't buy the materials and assemble a 16,000 pound dish for that. It defies the laws of physics, materials procurement and materials costs," he says.

In addition, says Butler, rolling out 12,000 Stirling Dishes by 2010 is theoretically possible, but it doesn't take into account any of the reliability issues that the company may face. Right now, there are only six dishes operating today. A more realistic timeline would be to roll out 1 MW (40 dishes) for a year of testing, then move to 10 MW and eventually to 300 MW. Even at such a large scale, SES may be looking at an installed cost of around US \$7.00 per watt, he says.

"They're going to buy 12,000 engines that they've never bought before and put them on dishes and expect to generate power. It's just highly unlikely. They're probably looking at 2020," Butler predicts.

SES declined three interview requests for this story.

There have been a number of stories in the media hailing the SES projects as the next big thing for solar. Butler says that none of them have critically evaluated the issues associated with cost, reliability and timeframe for development.

That type of unchecked enthusiasm is not the way to build a sustainable industry, says Fairley, the journalist. The best way to educate people about the potential of renewable energy is to be realistic about what the technologies can offer.

"One of the failings of technology journalism over the years has often been a tendency to focus on the technical potential of new products to the exclusion of the present technical challenges that need to be overcome. It's important for us to always be flagging those challenges," says Fairley.

Import Capacity of Transmission Lines Serving Southern California

The alternating current transmission import capacity currently serving Southern California, via Path 46 and Path 26, is approximately 14,000 MW. The direct current transmission import capacity currently serving Southern California, via the Pacific Intertie and the Intermountain DC transmission lines, is approximately 5,000 MW. Total import capacity is approximately 19,000 MW.

The three Southern California utilities that utilize this import capacity are Southern California Edison (SCE), San Diego Gas & Electric (SDG&E), and the Los Angeles Department of Water and Power (LADWP). These three utilities have collective average annual electricity retail sales of approximately 14,000 MW, and a collective peak demand of approximately 33,000 MW.¹ The peak demand and annual retail sales for each utility are shown in the table below.

Utility	SCE ²	LADWP ³	SDG&E ⁴	Totals
2007 peak demand, megawatt (MW)	23,000	5,700	4,600	33,000
2006 annual retail electricity sales, gigawatt-hr, (GWh)	79,000	23,000	17,000	119,000

1 GWh = 1,000 MWh

I. Path 46, Southern NV and Western AZ to SoCal, capacity: 10,100 MW

Source: http://www.nationmaster.com/encyclopedia/Path-46#Map_of_all_the_500_kV_wires

The entire Path 46 system has a capacity of transmitting 10,100 MW of electrical power to the population centers of Southern California. The source of the electricity is hydroelectric dams like Hoover Dam on the Colorado River, fossil fuel plants like the clusters of natural gas-fired plants in the Las Vegas area and western Arizona and coal plants in various western states, and nuclear power from the Palo Verde Nuclear Plant in western Arizona.

II. Path 26: Northern CA to Southern CA, capacity: 3,700 MW

Path 26 is a set of three 500 kV transmission lines that is the SCE intertie with Pacific Gas & Electric (PG&E) to the north. The Path is located in the southern Central Valley of California (San Joaquin Valley), the Tehachapi and Transverse Ranges, and the High Desert area. The three Path 26 500 kV lines can transmit 3,700 MW north to south (http://en.wikipedia.org/wiki/Path_26).

III. Pacific DC Intertie: Oregon to LA, capacity: 3,100 MW

The Pacific DC Intertie (also called Path 65) is a transmission line from the Pacific Northwest to the Los Angeles area using high voltage direct current (HVDC). The line capacity is 3,100 MW, which is enough to serve two to three million Los Angeles households.

IV. Intermountain DC Line: Utah to LA, capacity: 1,920 MW

Intermountain is the designation of a HVDC transmission line between the Intermountain Power Plant in Utah and Los Angeles. The Intermountain is an overhead line with a length of 785 km that can transfer up to 1,920 MW at 500kV.

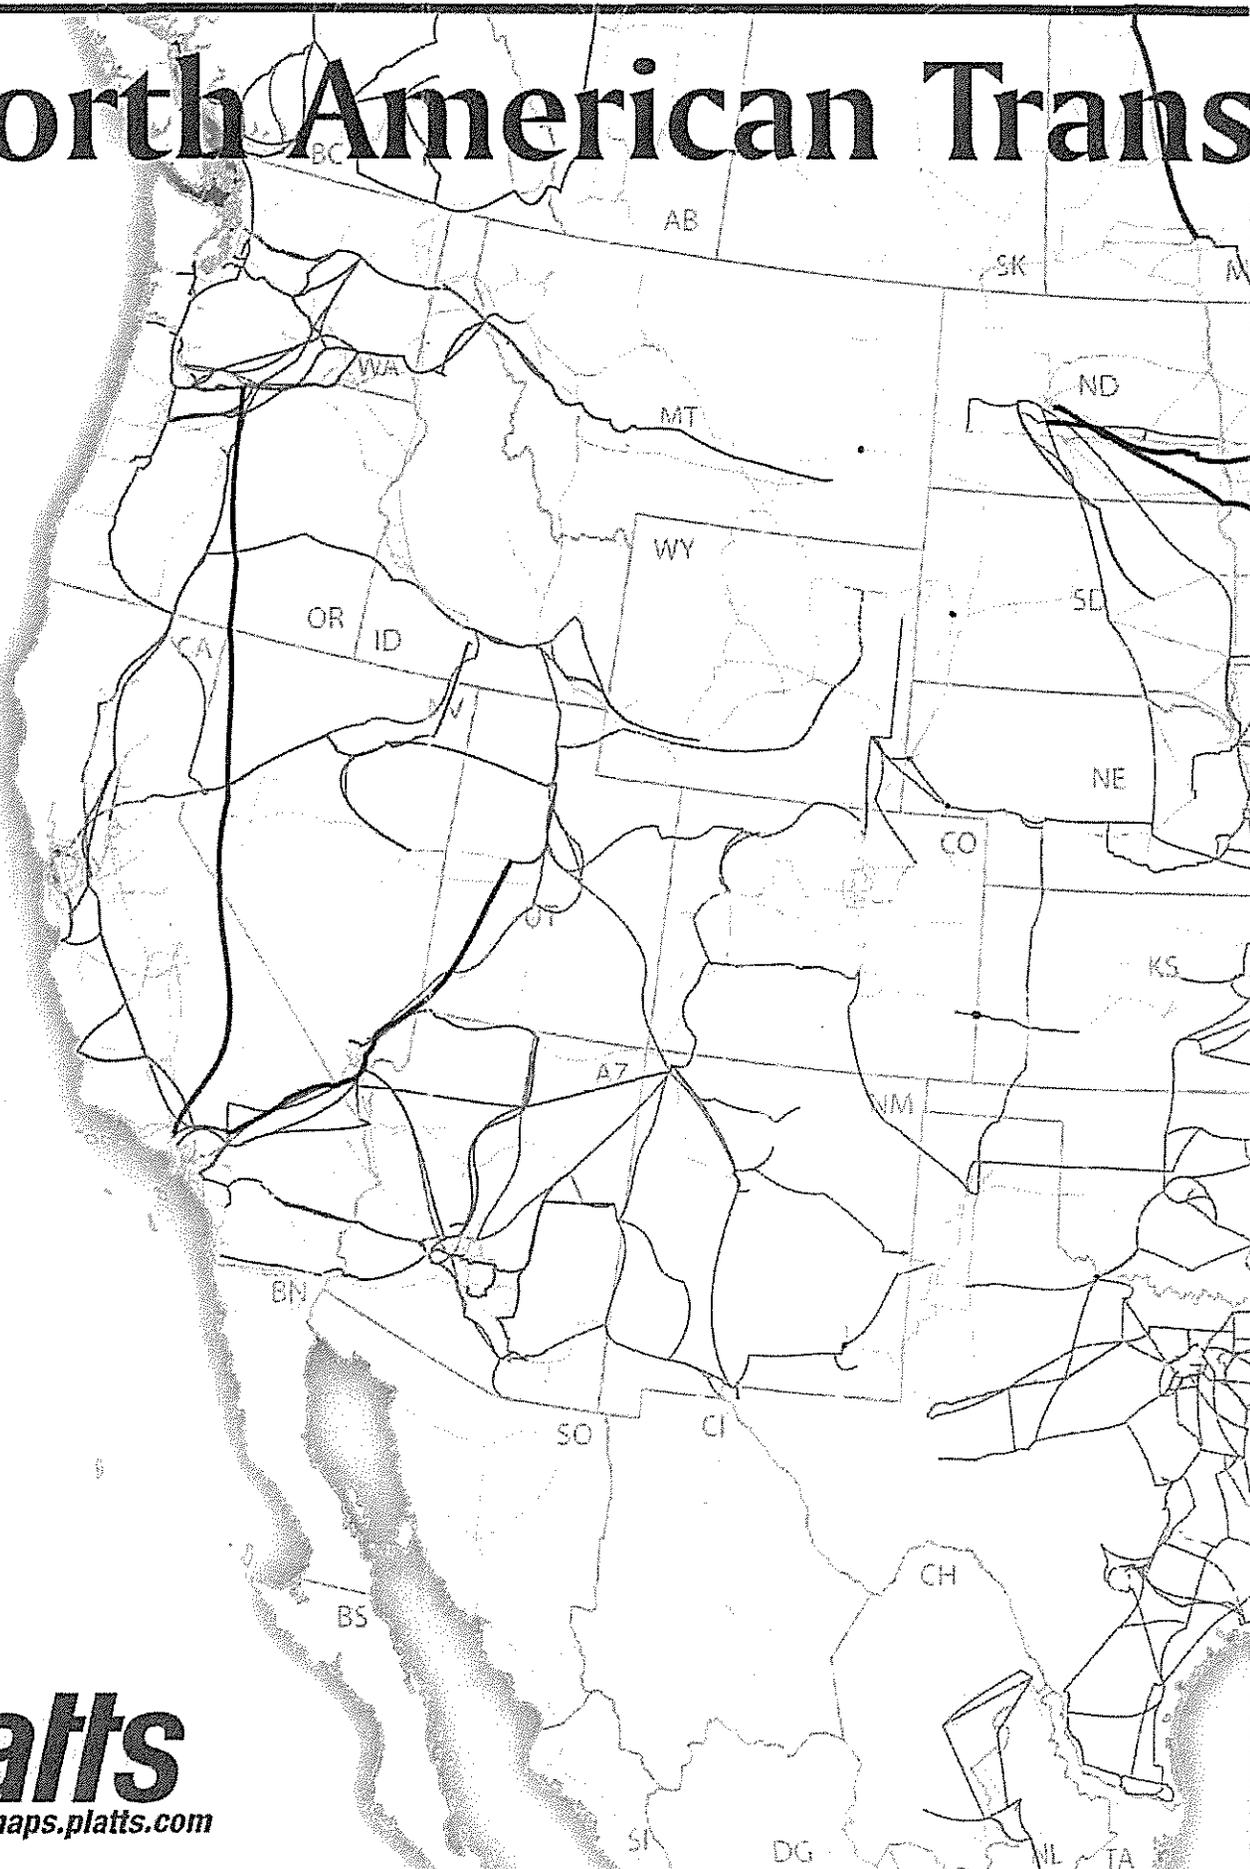

¹ The combined annual average retail sales of the three utilities is calculated by dividing the annual retail sales of 119,000,000 MW-hr by 8,760 hours in a year. $119,000,000 \text{ MWh/yr} \div 8,760 \text{ hr/yr} = 13,600 \text{ MW}$.

² SCE peak demand: Business Wire, *SCE customers use record amount of electricity today*, August 31, 2007. SCE annual retail electricity sales: CEC, *2007 Integrated Energy Policy Report*, January 2008, p. 128.

³ E. Martinez – COO LADWP, *Planning to meet the challenge*, PowerPoint presentation, January 19, 2006. The 2005 peak demand of 5,667 MW identified in this presentation is higher than the 2007 peak demand projection of 5,400 MW.

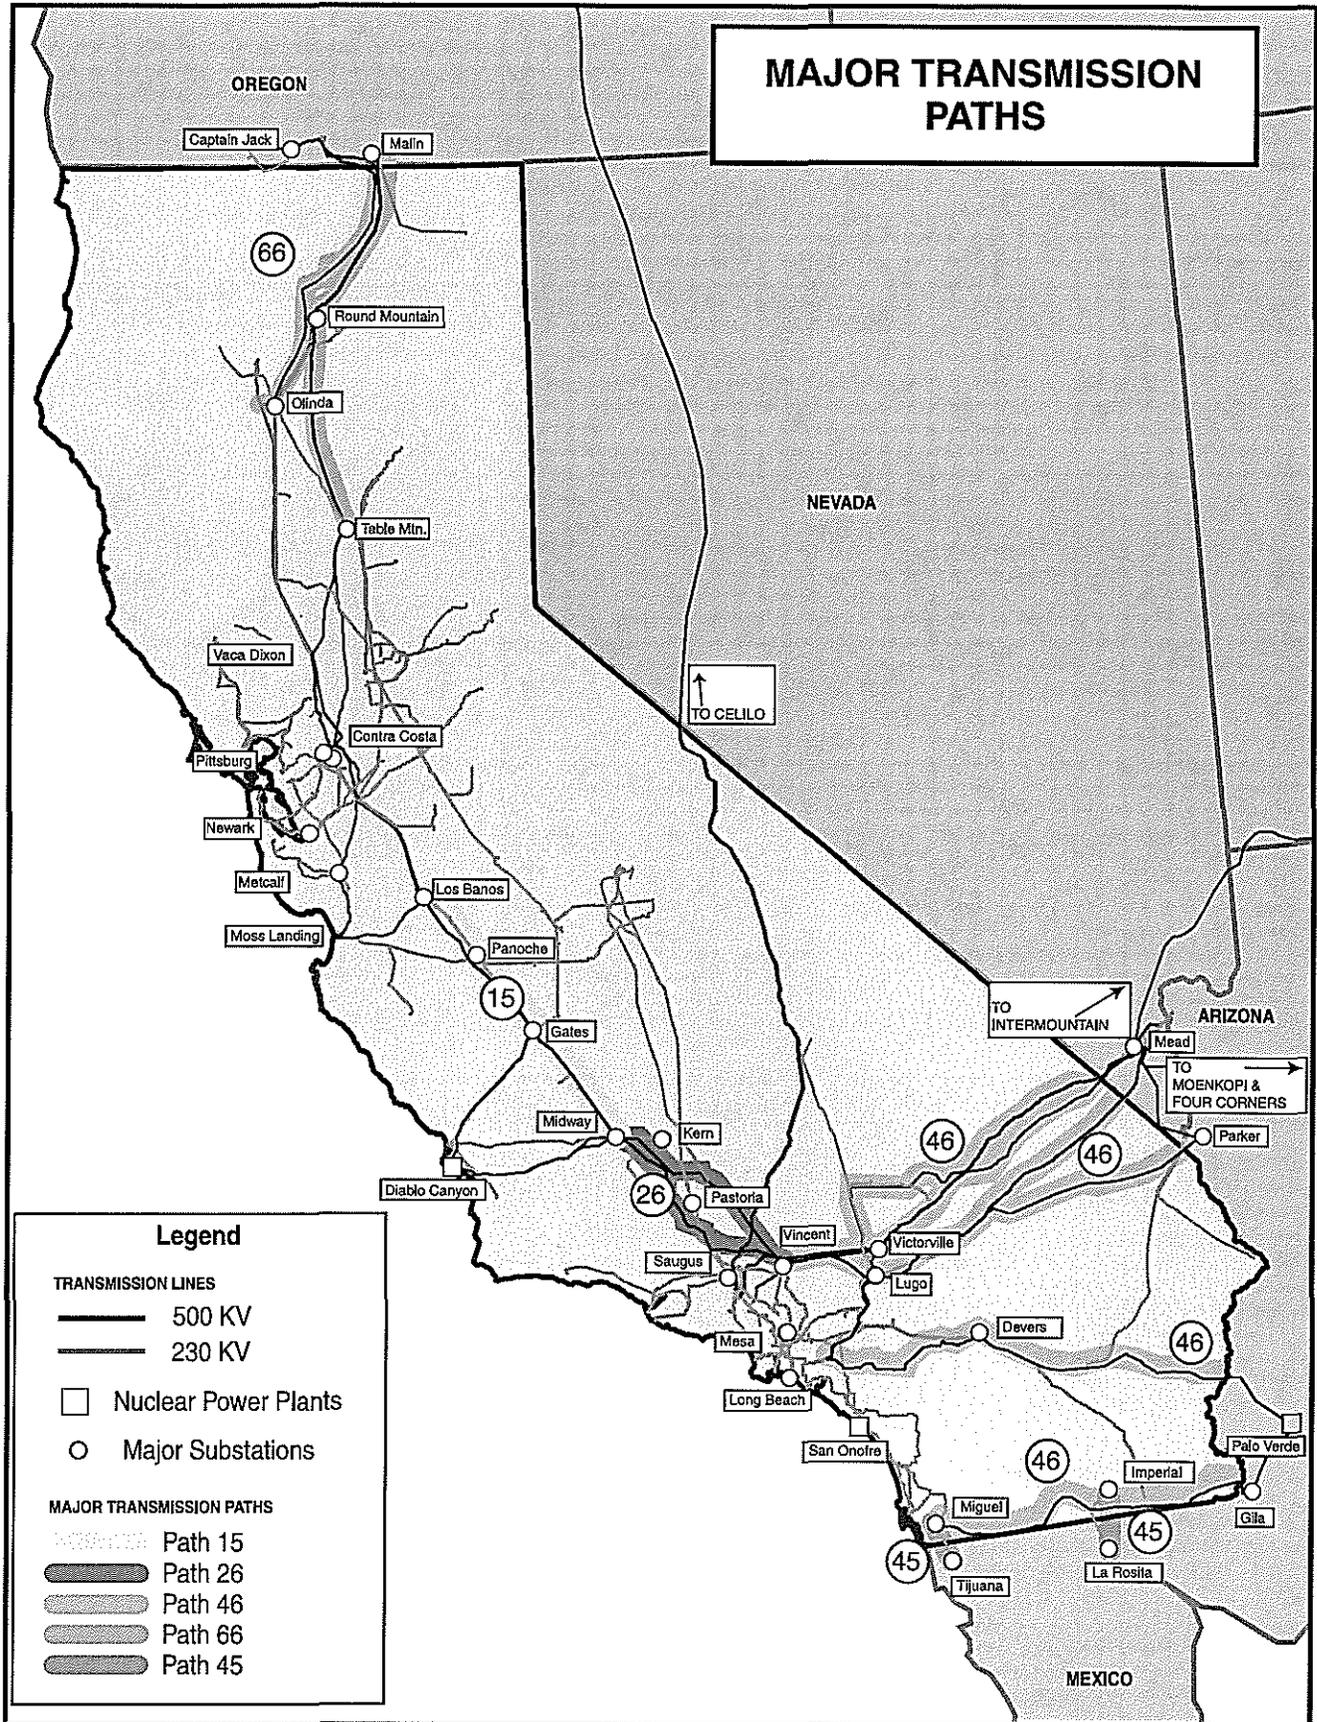

⁴ SDG&E peak demand: US News, *Southern California sets power records*, September 4, 2007. SDG&E annual retail electricity sales: CEC, *2007 Integrated Energy Policy Report*, January 2008, p. 128.

COMMISSION

STRATEGIC TRANSMISSION INVESTMENT PLAN

COMMISSION REPORT

Prepared in Support of the *2005 Integrated Energy
Policy Report* Proceeding (04-IEP-1K)

NOVEMBER 2005
CEC 100-2005-006-CMF

Arnold Schwarzenegger, Governor

Bill Powers

From: Bill Powers [bpowers@powersengineering.com]
Sent: Thursday, September 04, 2008 11:19 AM
To: 'Thomas Del Monte'
Subject: additional information

Thomas,

Polycrystalline silicon PV and thin-film PV cost estimates are included on pdf p. 63 (p. 6-7) of the August 2008 RETI Phase 1B draft report: See:

http://www.energy.ca.gov/reti/documents/2008-08-16_PHASE_1B_DRAFT_RESOURCE_REPORT.PDF

Also, the CEC 2007 IEPR notes (p. 143) the much higher value of on-peak point-of-use PV compared to the market price referent (MPR). The 2007 IEPR notes that SCE pays 3.28 times the MPR for on-peak commercial PV. Slightly higher installed capital costs for thin-film PV systems spread over many commercial buildings and parking lots, compared to putting 500 MW or 1,000 MW on one contiguous utility-scale site in a remote area, would be more than offset by the much higher composite value (of on-peak and off-peak hours) of point-of-use PV within the load center. See: <http://www.energy.ca.gov/2007publications/CEC-100-2007-008/CEC-100-2007-008-CMF.PDF>

I will include this e-mail as an attachment to the ex parte notification I file on today's meeting.

Regards,

Bill Powers

BEFORE THE PUBLIC UTILITIES COMMISSION
OF THE STATE OF CALIFORNIA

In the Matter of the Application of San Diego Gas
& Electric Company (U 902 E) for a Certificate of
Public Convenience and Necessity for the Sunrise
Powerlink Transmission Project.

Application 06-08-010
(Filed August 4, 2006)

**MOTION OF THE
ZEMER ENERGIA
FOR PARTY STATUS**

Zemer Energia (ZEMER) respectfully moves for party status in this proceeding, Application (A.) 06-08-010. This Motion is filed pursuant to Rule 1.4 of the Commission's Rules of Practice and Procedure.¹

**I.
DESCRIPTION OF ZEMER ENERGIA**

Zemer Energia (ZEMER) is a subsidiary of Unión Fenosa , a leading international energy company, and the third largest electric utility in Spain. In México, Unión Fenosa currently owns and operates 1,550 MW of natural gas combined cycle generation with another 450 MW combined cycle generation facility currently under construction. ZEMER was established to develop renewable energy generation projects for the Mexican and California electricity markets. Union Fenosa currently has approximately 1,230 MW of wind power under development in México, of which 1,000 MW are located in northern Baja California, in an area adjacent to the border with California known as "La Rumorosa".

The wind projects at La Rumorosa are part of Union Fenosa's €9,000 million Euro global strategic investment plan "BIGGER", of which €1,500 million Euros are specifically earmarked

¹ Rule 1.4 of the Commission's Rules of Practice and Procedure permits a person to become a party to a proceeding by, among other things, filing a motion to become a party. A person filing such a motion must disclose the identity of the persons or entities in whose behalf the motion is made and the interest of such persons or entities in the proceeding. The

for projects in México. Union Fenosa plans to build the projects with its own resources without seeking external sources of financing. The initial 500 MW of La Rumorosa wind electric generation were bid in the 2008 RPS solicitations and are currently in contract negotiations. ZEMER is actively seeking additional off-takers among California utilities for the remaining 500 MW output of its La Rumorosa wind project.

ZEMER has considered various transmission routes for the energy output of its proposed La Rumorosa wind generation facilities. To this end, a Union Fenosa subsidiary submitted two separate interconnection applications to the CAISO with interconnection points at the Miguel and Imperial Valley substations. One of these applications, for interconnection to Imperial Valley Substation (IVSS) is now part of the CAISO transition cluster, having paid all earnest fees due and having demonstrated proof of land control to CAISO's satisfaction.

Pending the outcome of CAISO's transition cluster study, ZEMER will build the necessary transmission infrastructure between its La Rumorosa wind farm and the first interconnection point to the WECC system. The current plan for interconnecting the first 500 MW of the project, calls for the construction of a 230-kV transmission line from its La Rumorosa to a point due south of the Imperial Valley Substation, and for the use of an existing cross-border line to IVSS. The schedule calls for the completion the first 500 MW and associated infrastructure by late-2011, in time for delivery under its RPS. The second 500 MW of wind capacity will require the construction of a new cross-border line to interconnect to IVSS or to a less distant interconnection point to be identified upon completion of the CAISO clustering study.

II.

ZEMER'S INTEREST IN THIS PROCEEDING

On October 31, 2008, the Commission mailed a Proposed Decision and an Alternate Proposed Decision in this proceeding. The Proposed Decision denies San Diego Gas and Electric Company's (SDG&E's) request for a CPCN to build the Sunrise Powerlink Transmission Project (Sunrise). The Alternate Proposed Decision approves the CPCN, but adds conditions to that approval. Specifically, the Alternate Proposed Decision requires SDG&E to file a compliance plan that, among other things, must "specify the renewable generation that will be developed and delivered on Sunrise."² In meeting this condition, SDG&E is required to provide significant detail about these projects, including expected binding commitments, project descriptions, and project construction schedules.³

As ZEMER's wind generation project in La Rumorosa will need sufficient transmission capacity from IVSS, or another point, to reach the California off-takers, ZEMER has a direct interest in these conditions and believes it can provide valuable input through comments and reply comments on the Alternate Proposed Decision and the Proposed Decision and the further rulings and additional Alternate Proposed Decision (President Peevey) that have now been issued in this proceeding. Further, only when this Alternate Proposed Decision was issued and became the subject of an oral argument and an all-party meeting over the last few weeks did ZEMER become fully aware of the impact of conditions that may be imposed by the Commission in authorizing the Sunrise Powerlink transmission line.

ZEMER, therefore, seeks party status to provide these written comments and participate on any further all-party meetings or oral argument on these proposed decisions, as well as any and all other related Commission actions and future phases of this proceeding. Because ZEMER's interest in this proceeding has emerged as a result of the conditions proposed by the

² Alternative Proposed Decision, Ordering Paragraph 2, at p. 284.

Alternate Proposed Decision, ZEMER's motion is timely and its contentions will be reasonably pertinent to the issues already presented in this proceeding. Finally, ZEMER's participation in this proceeding will not prejudice any existing party.

**III.
CONTACT INFORMATION**

On behalf of ZEMER, the following name and information should be included in the "Party" portion of the service list for A.06-08-010:

**Nicolas Puga/Bates White, LLC for
Zemer Energia, S.A. de C.V.**
1300 Eye Street NW, Suite 600
Washington, DC 20005
Telephone: 202/652-2184
Facsimile: 202/408-7838
Email: nick.puga@bateswhite.com

³ Alternative Proposed Decision, Ordering Paragraph 2, subparts (a) – (c), at pp. 284-285.

**IV.
CONCLUSION**

ZEMER clearly has a pertinent and substantial interest in, and would be affected by, the Proposed Decision and Alternate Proposed Decision mailed in this application on October 31, 2008, and the further Alternate Proposed Decision mailed on November 18, 2008. Until the first Alternate Proposed Decision was issued, ZEMER did not know that conditions would be imposed that would directly affect its interests. ZEMER has, therefore, timely sought to become a party to this application and respectfully moves the Commission to grant ZEMER party status in A.06-08-010 to permit ZEMER to submit written comments on these proposed decisions and the further Alternate Proposed Decision and fully participate in all aspects of this proceeding from this date forward.

Respectfully submitted,

December 9, 2008

Subject: STIRLING Solar Two - 08-AFC-5
Attachments: SD Smart Energy 2020_report_complete_FINAL1.pdf

DOCKET	
08-AFC-5	
DATE	<u>Jan 03 2009</u>
RECD.	<u>Jan 05 2009</u>

Mr. Meyer,

I tried to get this out to you last night, but my internet was down, so I drove to the city to be able to email this to you today.

The Stirling Solar Project was well vetted in connection with the Proposed Sunrise Powerlink Project (SPL). The ALJ Steve Weissman worked on SPL for almost three years and his conclusion was that SPL should not be constructed at all. No conditions. I went to about every public meeting about SPL and I heard the pros and cons about the Stirling Energy Systems Project (SES). At best it is a prototype that is having extreme difficulty getting to the level of any production at all. You can't set aside 10 square miles of our public lands when the commercial production of these dishes is unproven. And even if it is proven in five or ten years, the cost for construction of the dishes and the cost for transmission required to get this energy to metro San Diego far exceeds the cost of In Basin Solar and Distributed Generation, as detailed in the San Diego Smart Energy 2020 report which was commissioned and funded by the San Diego Foundation (see attached).

We who are opposed to the construction of the SPL are equally opposed to the taking of our public lands for unproven R&D Projects such as the SES, and we will do everything we can to stop these unnecessary projects at the expense of our ratepayers and for the benefit of our corporate public utilities.

The Sun Does Shine in San Diego!

I want to go on record as being opposed to the Solar Two Project being sited in Imperial county, Ca..

Reasons:

Air Quality, We have terrible air quality, one of the big problems is dust, This project would put alot of additional dust in the air. We have a high rate of aslhma-, elementary school children have a 40% rate of asthma compared to the coast with a rate of 15-18%. (info. from American Lung Assoc.)

Water Use

Octillo Sit on a aquifer that contains drinkable water. This water has already been used alot by Plaster City for the manufacture of wallboard. To allow this water to be user for industrial purposes is crazy as drinkable water is a iincreasingly scarce resource.

Clean up Costs

Sterling Energy Systems is a LLC, A bond for clean Up and restoration of the site needs to be posted, or else Imperial County is going to be stuck with a clean up bill or a junkyard that extends for 6000 acres. The amount of the bond needs to be established after aprocess that names a accurate figure for this. Also the amount of financing currently promised is woefully inadequate for this project. We currently are in a increasingly unstable economic era worldwide where all bets are off.

New Technology

Thin-film PV is becoming more competitive has the technology is rapidly improving. I think its going to go like computers have with expotential growth and innovation. This will enable a localized and decentralized solar power plants making the Solar Two Project obsolete.

Thank you,

SUBJECT: PUBLIC INPUT AND COMMENTS ON SES SOLAR TWO (08-AFC-5)

Since the main thrust for the permitting of this project seems to be directed at environmental, cultural and land use issues, I will address my concerns here with follow-up on the reason for these concerns based on the non viability of implementing this mega scale project as proposed by SES. Please enter these concerns with their backup information as public inputs to be addressed by the California Energy Commission.

1. Since thousands of acres of public land are going to be dedicated to this solar energy project, what are the implications of taxpayer responsibility for SunCatchers removal and remediation of the land should a failure of the technology implementation occur? Such a cleanup effort even in the first phase would cost hundreds of millions of dollars, while SES Solar Two, LLC would declare bankruptcy and abandon the site.

2. As I understand it, the justification for the Southwest Power Link is to carry several hundreds of MW from the SES Solar Two Project to the San Diego region. If SES Solar Two fails, as it now stands Sempra Energy is under no commitment to carry other renewable energy sources and is free to carry energy from coal or gas fired plants in Mexico. This appears to have been an ulterior motive in Sempra's pushing for the Southwest corridor while demanding approval without a definite commitment to use this line for renewable sources of energy.

PROBLEMS FACING SUCCESSFUL IMPLEMENTATION OF SES SOLAR TWO "SUNCATCHERS"

1. Stirling Cycle engines have been around for something like 175 years with only a few actually placed in useful operation. The concept is proven, the realization isn't!
2. Philips, auto manufacturers and others have spent millions of dollars trying to adapt Stirling Cycle engines for commercial markets, but without success.
3. SES Solar Two engines operate at very high temperatures, pressures and rotary speeds using hydrogen gas as the transfer medium, all creating long term problems with metal creep, metal fatigue and seal integrity.
4. The SunCatchers have not been tested in the actual harsh environment of the desert with only six units being run by Sandia Labs at their Albuquerque, NM site, with a few others being run by Boeing in the Los Angeles area.
5. As I understand the status of the SunCatchers, the final design is nearing completion with release in early 2009. So none of these units has been built yet, and certainly will not be tested until late in 2009. How can any rational decision be made at this time to site 12,000-30,000 of these units on public land based on current evaluation data?

6. I do not know of any other successful project of this magnitude that has advanced from several units to tens of thousands of units in a single step.

PLAN FOR SUCCESSFUL IMPLEMENTATION OF SES SUNCATCHERS

1. Permit SES Solar Two, LLC to construct and test a 1 MW setup comprising 40 SunCatchers on their privately held lands near Plaster City, CA. Run these units for six months to a year, tabulating collected energy, operational availability and operating costs to determine project viability before proceeding to a larger model to be sited on public lands.
2. This approach will in the long run be beneficial to both the U.S. taxpayer and to SES Solar Two, LLC.
3. Defer construction of the Southwest Power Link until a legitimate need is established for its use based on bringing renewable energy from Imperial County to San Diego..

RECD. JAN 14 2009

SUBJECT: PUBLIC INPUT AND COMMENTS ON SES SOLAR TWO (08-AFC-5)

I fully agree with the concerns of fellow San Diego County resident Mr. Richard A. Ayers, engineer, when he asks "since thousands of acres of public land are going to be dedicated to this solar energy project, what are the implications of taxpayer responsibility for SunCatchers removal and remediation of the land should a failure of the technology implementation occur? Such a cleanup effort even in the first phase would cost hundreds of millions of dollars, while SES Solar Two, LLC would declare bankruptcy and abandon the site.

The SunCatchers final design is nearing completion with release in early 2009. This means that none of these units have been built yet, and certainly will not be tested until late in 2009. How can any rational decision be made at this time to site 12,000-30,000 of these units on public land based on current evaluation data?"

The current economy in the United States dictates that large financial commitments are looked at with a "common sense" point of view. The bottom line should be to make sure that a product's final design is first completed – and then tested in the environment it is planned to be used – that of sand storms and the "white ground fog" from Plaster City. These tests, of course, should be conducted on privately owned property – not public lands.

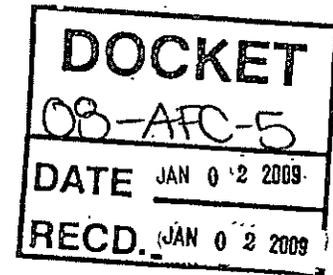

I add my voice with Mr. Ayers' when he requests that these units be "run for six months to a year, tabulating collected energy, operational availability and operating costs to determine project viability before proceeding to a larger model to be sited on public lands."

Re: 08-AFC-5: SES Solar Two

Mr. Meyer,

As I understand it, this process is to decide whether to site the Stirling Energy Systems (SES) Solar Two Suncatcher project on over 6000 acres of public lands in the El Centro area.

The involvement of public lands makes the evaluation of the viability of this unproven technology the major sticking point of this proposal. Six thousand acres will be permanently "disturbed."

I tried to find current technical information online for the Solar Two Suncatcher project at Sandia Labs. The only information available was produced by SES.

I thought that as a public-private partnership the technical reports and studies of this ongoing research and development would be public documents. I was wrong.

Dr. Tom Mancini, Program Manager, Concentrating Solar Power, Sandia National Labs, told me that since SES was providing the larger share of money for this project (\$100 million (SES) to \$1 million (Federal)), SES controls the information. None of the work done on the most recent research and development of the Solar Two Suncatcher (2001 to present) was available to the public.

This is a BIG problem in attempting to assess the viability of this technology.

I don't think the Energy Commission can make an informed decision on this without an independent assessment of the technology. There is no way to do that with SES as the sole source of information.

At the November 24, 2008, CEC hearing there were concerns about how the mechanical parts, mirrors, and seals would perform in the sand blown environment of Plaster City. The SES representatives were quick to reassure everyone that those issues had been successfully addressed and resolved. They expected that to suffice. It doesn't.

When Dr. Mancini and I talked on the phone, he expressed surprise that SES was promising such a rapid deployment of the Solar Two Suncatchers from 6 units at Sandia

to 12,000 in the field by 2010-2011. He stated that the latest iteration, the final design, of the technology was just being installed; the new pedestals for the four units going in as we spoke. He predicted that it would be three years before the technology would be commercially available.

I'm pretty sure that SES made some sweeping promises at the November 24, 2008, hearing about getting 12,000 Solar Two Suncatchers up and running at Plaster City by 2010-2011.

As nice as the SES folks might be there is no reason to trust them to tell the truth about the Solar Two Suncatcher technology. It's a business. They need investors with large amounts of cash and they need a place to put the Solar Two Suncatchers.

Sandia Labs, no matter how righteous and above reproach they might be, cannot provide a stand alone independent analysis for two reasons: (1) contractually they can't; and (2) there is the \$100 million that they are being paid which may skew their view of things.

I am including the email string between Dr. Mancini and I which may suggest other and/or clarify some issues. It starts with my request for public information. There is a telephone conversation between us and two follow up emails regarding that phone call.

Sincerely,

Charlene Ayers

Hello Mrs. Ayers,

Thanks for the kind comments. I enjoyed visiting with you as well.

I would like to clarify a couple of points.

First, when I made a presentation to the group reviewing the Sunrise Power Link project, it was clear that SDG&E and the environmentalists and the NGO community had already had major issues. During our meeting, they did not seem to me to be at all receptive to discussions on several issues raised by the remaining groups.

Second, my comment related to the Solar 2 Project, was that I believed, based on information provided by several different parties, that there was sufficient existing transmission capacity for the initial phase of the project (~300 MW). However, as I explained, I've also heard that SDG&E plans to develop more of the geothermal resources in the Imperial Valley, which would require additional transmission capacity.

Last, while we do share a lot of information with SES, they do not keep us informed of their deployment plans and strategies. Over the course of the past year, their strategy has changed several times and, while I may have been surprised that they intend to deploy 12,000 systems during the next year, it is not at all unreasonable to think that they could do it.

Again, I very much appreciate folks like you and your husband, activist citizens who track civic activities and make sure that things are being done for the right reasons.

Best Regards,

Tom

Subject: RE: STIRLING ENERGY SYSTEMS DEVELOPMENT WORK

Dr. Mancini...

I was pleasantly surprised by our conversation yesterday. I am glad that you insisted on it.

As you surmised, my attempts to get information on the SES Solar Two Suncatcher technology were motivated by SDG&E's plans for the Sunrise Powerlink. They are

citing the SES Solar 2 project as the reason for it all.

I was interested in your comments about their involvement. It sounded like the SES Solar Two Suncatcher technology could do very well by itself without any help by SDG&E.

I believe your comment was that when you came out to make a technical presentation on this technology, you were put off by SDG&E's hijacking of the SES Solar Two Suncatcher technology, adding that they drove all the NGOs off.

Although, not a transmission expert, you thought that SDG&E could handle the all the energy produced by SES Solar 2 project by expanding their existing lines.

After my husband (Lehigh-Engineering Physics '53) and I attended the last California Energy Commission's hearing (Nov. 24, 2008) on the SES Solar Two, we thought that a test group of 100 units sited at Plaster City would be a good research strategy.

According to SES's presentation at the hearing, they intend to go from the 6 units at Sandia Labs to 12,000 in the first phase. That doesn't sound very scientific to us.

In our conversation yesterday, it sounded like this was the first time you had heard of these plans, and you were a bit skeptical of that timeline.

SES also stated at that hearing that they would have those first 12,000 units at Plaster City up and running by 2010. I think that you said that it would take 3 years more to make the technology commercially ready, and that would be with the new design (4 units) being set up for evaluation as we speak.

Mr. Liden, VP SES, stated to us directly as he was working the room before the November 24, 2008 hearing that the investment breakdown was government \$1 to SES's \$5. He urged us to see what a good value that was.

As per our conversation, the investment breakdown is government \$1 million and SES \$100 million and whenever the commercial partner puts in more money than the government, the commercial enterprise controls all the information because of the proprietary issues. That would be why there are no public documents available, and why all the news releases have that SES spin.

The once-in-a-blue-moon conditions under which the award winning "Popular Mechanics" test was conducted was a media event orchestrated by SES. You reported that the actual annual overall performance of the Solar Two Suncatcher technology is 24% which is still pretty good. You pointed out that a single solar cell has 38.1% efficiency but when put into an array the efficiency drops to 20%.

Here's the link to the report "Status of the Boeing Dish Engine Critical Component Project (Jan 1999)" that my husband found online:

http://www.osti.gov/bridge/product.biblio.jsp?osti_id=3273

Thank you for the "SCE Dish Report" from 1993. It looks to be very comprehensive.

Charlene Ayers

----- Original message from "Mancini, Thomas R" <trmanci@sandia.gov>: -----

Hello Mrs. Ayers,

I enjoyed visiting with you earlier today. As I noted in our discussion, there are a number of issues around the Sunrise Power Link transmission line with which I do not necessarily agree. Also, as your husband rightfully noted, defining a point performance metric under "best conditions" is not really a fair way of characterizing the annual performance of a system. But, of course, we weren't trying to characterize this as anything other than what it is – a high level of performance under best conditions.

Attached to this message is the early performance paper for the pre-cursor to the SES system. To a first order, the performance reported in this paper fairly represents that of the current design.

Best Regards,

Tom

Dr. Mancini...

I, too, am sorry for the mix up. I'm not looking for a chat on this technology (SES-Solar Two Suncatcher).

I am looking for public documents on the testing and research that describe the methods and conclusions.

Please direct me to where I can view those technical documents.

Charlene Ayers

Hello Ms. Ayers,

Your note to Tom Hunter was forwarded to me for response.

I apologize for the misunderstanding. Unfortunately, I never received your original email message because Mr. Sanchez must have forgotten that my email address includes my middle initial (i.e. trmanci@sandia.gov). I would very much like to visit with you about Stirling Energy Systems' development work and our support of it here at Sandia. Our group is very excited about the expansion of Concentrating Solar energy projects in Southwest and we are working hard to support them all.

I have your telephone number and will call you later today to schedule a time when we can have a more extended discussion.

Best Regards,

Tom

SCOPING COMMENTS: SES SOLAR TWO PROJECT, DOCKET NO. 08-AFC-5

Dear Mr. Meyer,

For the record, I have attended the July 24, 2008 Imperial County Planning and Development Services Pre-Application Meeting for Stirling Energy Systems, the November 24th CEC/BLM Informational Hearing and Scoping Meeting and site-visit, and the December 18th CEC/BLM Data Response and Issues Resolution Workshop and Scoping meeting. SES/URS also provided me with a DVD and hard copy of the Response to CEC & BLM Data Requests 1-52. As requested at the December 18th meeting, these comments are being sent directly to you and not to the BLM. Even though I am an elected land use representative for the rural Eastern San Diego County community of Boulevard, and the President of the public benefit non-profit group, Backcountry Against Dumps, these comments are my own. I am a property owner and taxpayer in both San Diego and Imperial Counties and a ratepayer that will be impacted by the massive and wrong headed SES Solar Two Project, the Sunrise Powerlink (deemed unnecessary and too environmentally and fiscally expensive by the CPUC's assigned Administrative Law Judge), Iberdrola Renewables 200 MW Tule Wind Project on approximately 20,000 acres of BLM land in Boulevard's McCain Valley Land Cooperative and Wildlife Management Area, and other questionable industrial scale renewable energy projects and related infrastructure—if they manage to come to fruition.

Large scale urban PV is more cost effective than remote solar and wind projects and the related Sunrise Powerlink

The CEC and BLM should reject the Solar Two Project and other such controversial behemoths as they do not represent the best and highest use of our public lands or the best interest of ratepayers and tax payers who will be forced to bear the economic burden of the resulting exorbitant rate increases and inflated taxpayer funded subsidies—not to mention the extensive and cumulative loss of use of our public lands and recreation areas to unnecessary energy and transmission projects. It is especially troubling and irksome when foreign entities will be reaping the rewards at our expense, with much of that tax and rate payer funded booty being spent outside the US and very little being spent within the impacted communities.

On-site and close to point of use renewable energy projects are far less destructive, expensive, and time consuming in regards to approval and litigation, and they do not require the destruction of public lands or extensive and vulnerable transmission lines. Bill Powers, PE, Powers Engineering, an intervener in the CPUC/BLM CPCN case for the Sunrise Powerlink (App. 06-08-010) provided some compelling research and backup documentation in a December 12, 2008 Ex Parte Communication. Powers' research shows that it would be cheaper to build 1,000 MW AC of thin-film PV in the urban core than to build the 1,000 MW Sunrise Powerlink. With a few adjustments, the same applies to the \$1.4 billion 750 MW SES Solar Two Project, especially when you add in the projected \$1.9 billion cost of Sunrise Powerlink and the necessary IV Substation upgrades and expansions for both Phase I and II of Solar Two. I have attached the 44-page Powers Ex Parte Communication (12-12-08) and hereby incorporate his information into the record.

I am also incorporating, by reference, the entire record for the Sunrise Powerlink case noted above, and all of the commentary, criticism, research and testimony that relates to the SES Solar Two Project contained within that record. That extensive record includes much more from Bill Powers along with especially relevant comments from the Utilities Consumer Action Network (UCAN), the Conservation Groups (CBD & Sierra Club) represented by attorney Steven Siegel, and all of their witnesses. I also hereby incorporate by reference Bill Powers Smart Energy 2020 plan (October 2007) which is also part of the Sunrise Powerlink CPUC/BLM project record. UCAN has already announced that they will appeal the CPUC's controversial December 18th approval of the Sunrise Powerlink using the extensive record and the Assigned ALJ's denial of the project based on that record. A similar suit is expected from the Conservation Groups.

SES's troubling responses to questions about their Solar Two Project

During the bus ride for the November 24th Solar Two Project site visit, SES's Robert Liden provided the following answers to questions posed by myself and others:

- Stirling Energy Systems has just \$100 million of the \$1.4 billion needed for the Solar Two Project.
(NTR is proposing to invest another \$100 million but that is still a mere fraction of what is needed)
- Equity funding is for the pilot project and manufacturing only. Their Imperial Valley Solar Two project is not funded.
- The 5-year accelerated depreciation rate is attractive to investors as are the renewable energy credits. Yet, when they talked to investors in San Diego prior to the November 24th hearing, none signed on.
- The SES solar engines are still in the research and development stage and they are *looking at* federal loan guarantees for innovative renewable energy concepts.

- SES will be adding another 4 *hand made* units at Sandia Labs to incorporate some changes in engineering needed for mass production. Their 6 existing units were installed at Sandia 3 years ago.
- They are still working with a Michigan plant on potential manufacturing of the solar engines. (An article in the San Diego UT on 12-14-08, reported that SES plans to have Linamar, a Canadian automotive products company produce the first engine mid-January, test it, and then enter full production by the end of next year).
- They may have a portable factory on-site for assembly of Sun Catcher units. (If so, where will it be located, how big will it be, and what are the impacts associated with that facility?)
- In response to a direct question about how they will deal with and mitigate the fact that the BLM project site is currently designated as a Limited Use (protected) Area with traffic restricted to the few existing routes of travel, *Liden ignorantly stated that the Limited Use designation meant the land had limited uses and was not good for much*. A corporate executive, looking for public support and the virtual gift of 10-square miles of public land, should have better knowledge of and respect for the land that belongs to the American people.
- They had to move their Solar Two Project boundaries due to significant cultural and historic resources and more may be found. (most associated with the Ancient Lake Cahuilla shoreline, artifacts, cremation sites, and sacrifice areas as noted by Carmen Lucas and the archeologist with Imperial Valley Museum).
- The entire project perimeter area (10-square miles) will be fenced off, as phases progress. OHV trails will be closed and motion activated lighting will be installed. (These impacts, alone, are significant and will completely alter the existing character and appeal of the desert landscape and habitat.)
- The SunCatcher units reportedly close automatically when winds exceed 35 mph. So, where are the onsite anemometers (MET towers)? It generally takes a minimum of three years to properly analyze the average wind speed and the frequency and intensity of wind storms. To a rational person, legitimate site specific wind information would seem to be necessary in order to determine the amount of down time for the SunCatcher units related to wind and dust storm events. Too much wind would translate into too much down time, the potential for sand damaged equipment (mirrors, gears and engines), and reduced power generation—all critical information.

Transmission / Sunrise Powerlink / IV Substation connection Phase I and II

During the same site visit bus trip, Liden provided the following information in response to

questions:

- The Solar Two Project is # 1 in the CALISO queue to connect to the Imperial Valley Substation for the 300 MW proposed for Phase I.
- Several hundred million dollars will be needed to upgrade the IV Substation for Phase I.
- For the 450 MW Phase II, they are # 4 in the CALISO queue for the inter-tie to the proposed IV Substation expansion and the yet-to-be-built Sunrise Powerlink transmission line.

The three big transmission questions are:

- Is there really any remaining capacity on the existing Southwest Powerlink to accommodate the proposed 300 MW of Phase I of Solar Two, beyond the current 80 MW of capacity reported by CALISO and as claimed by Sempra Energy in their April 2008 amendment to their DOE Presidential Permit Application (PP-334) for a new 500 kV transmission line at Jacumba in Eastern San Diego County? Sempra alleges that their new cross-border line is needed to accommodate their 1,250 MW La Rumorosa Wind project, and to connect it to the Sunrise Powerlink. The La Rumorosa project has also been referred to as Baja Wind and more recently as Energia Sierra Juarez. (See Sempra project information at: <http://www.semprageneration.com/esj.htm>).
- What are projects # 1, 2 & 3, which are ahead of Solar Two Phase II, in queue for the expanded IV Substation and Sunrise Powerlink transmission project, and what capacity, if any, will be left on the Sunrise Powerlink for the proposed 450 MW of Phase II of Solar Two?
- What are the alternative means of transmission in the event there is no available capacity on the existing Southwest Powerlink for Phase I, and /or legal challenges overturn the CPUC approval of SDG&E's highly controversial Sunrise Powerlink project?

American and local jobs

SES representatives repeatedly use the lure of jobs for American and Imperial Valley workers as a reason to approve their Solar Two project. At public hearings in the Valley they talk about all the green collar jobs that will be generated. Unfortunately, the reality will be the importation of already trained workers from elsewhere in the country with very few high paying jobs going to local Valley workers. There is also the very real potential for skilled and unskilled Green Card workers to be brought in from both Mexico and foreign countries to fill the few jobs that will be available. SES has also promoted the project by talking about the American auto workers that will be put back to work building Stirling Solar engines, *but* the San Diego UT just reported their deal with Linamar, a *Canadian* automotive products company.

Visual Resources

It was reported that there will be virtually no reflection impacts to passing motorists on I-8 and Navy, US Border Patrol, other air traffic flying in the designated corridor overhead, from the 30,000 mirrored dishes as all light will be deflected. Pilots will reportedly see a gray area. This is rather hard to believe and needs to be verified, especially with the number of potentially impacted drivers on both east and west bound I-8, Dunaway Road, and Evan Hews Hwy, along with the heavy air traffic associated with the Navy Air Station located several miles to the east at Seeley, and the frequent low level Border Patrol helicopter and other Homeland Security related flights in the area.

The complete landscape and character alteration that this project represents is significant, massive and cumulative in nature all on its own. The impacts are off the charts when you add in the many other projects that will be highly visible in the same area like Iberdrola Renewables 200 MW Tule Wind project on approximately 20,000 BLM acres located on the ridgeline to the west, Greenhunter Wind Energy LLC (formerly Windhunter) on their 6,250 acres of BLM land just west of Solar Two, and pending applications for up to 5 more MET towers, in the same general area, with potential industrial wind turbine projects to follow, as noted by BLM in their November 2008 FONSI and Decision Record for Greenhunter's 197 foot tall MET Tower ROW.

Add in Sempra's Energia Sierra Juarez (AKA La Rumorosa Wind and Baja Wind) which will cover approximately 60 miles of highly visible ridgeline to the southwest starting at the US Mexico border and Imperial County line, and the Union Fenosa's Zemer Energia's 1,000 MW wind energy project, proposed for the same highly visible La Rumorosa area, with the first 500 MW planned for export to the US via the Imperial Valley Substation and local transmission lines. The attached December 9, 2008 'Motion of Zemer Energia for Party Status' in the CPUC/BLM Sunrise Powerlink proceedings confirms their intent and the fact that they have paid their fees to CALISO. Their motion was granted.

Wind-Zero, another highly visible large-scale community character altering project is proposed on about 1,000 acres of private land between Solar Two and the communities of NoMirage and Ocotillo to the west

Go to pages 17 & 18 of Sempra's September 18, 2008 Power Point presentation link below, which includes maps and references to the 60 miles of Sierra Juarez (La Rumorosa) ridgeline where Sempra and the Union plan to install industrial scale turbines over 400 feet tall:

Cultural Resources

Carmen Lucas, a well respected Native American of Kumeyaay decent, spoke passionately about the extensive and highly valued cultural resources placed at risk by the Stirling Solar Two project. Lucas said that she was there at the request of the State Office of Heritage Protection. An archeologist with the Imperial Valley College museum also spoke about significant concerns with the cultural and historical resources at risk and the viability of the project site. When you add the impacts from this one project to all the other proposed and existing projects and the approved and illegal uses, in the El Centro Field Office planning area, the CDCA, and other BLM lands in the region, especially for so-called renewable energy and transmission projects, the cumulative impacts are massive and virtually incalculable.

Air Quality Impacts / Dust & Fugitive emissions / Cumulative impacts

The 10-square mile project site and the extent of disturbance to fragile, fine, and sandy desert soils, and the need to run back and forth in vehicles to repeatedly wash the mirrors on 30,000 SunCatcher units, the potential on-site generation and leakage of hydrogen gas, diesel trucks and trains used to deliver equipment, all represent an increased threat of negative impacts to air quality. Add to that the industrial mining and plaster board processing plant at Plaster City, idling diesel train engines and truck, sand mine truck traffic from multiple operations in the area, Plaster City OHV Park and the related OHV traffic and activities, and you have a major problem. It is important to note that disturbed desert soils no longer serve as a carbon sink.

Water Resources / flood plains / Erosion control

SES keeps talking about using approximately 32 acre feet per year of IID water for their project but it is unclear if an agreement has been formally secured and what amount of water delivery is guaranteed over the life of the project. Various maps show numerous channels, desert washes, and flood plains through out the project area. Along with concerns for any alterations of the natural flow patterns on wildlife, habitat and groundwater recharge, there are concerns with the potential for inundation of numerous SunCatchers, and on-site infrastructure during El Nino years and significant storm events like Hurricane Kathleen that roared through the area (1977-78?). I experienced that hurricane first hand. It washed out sections of I-8, the rail road, and a wide swath of the community of Ocotillo all near the Solar Two project area. Several maps provided in the Response to CEC/BLM Data Requests 1-52 show numerous Suncatchers, roads, and more, situated within the identified flood plains. Maps also show "debris basins" located in flood plains. All floodplains and natural drainage channels and washes should be off-limits for any project related installations or alterations. Don't ever underestimate the amount of water that flows in the desert and the destruction it can cause. There are also concerns with the lack of detailed information on the evaporation ponds and the chemical make up and ultimate disposal destination of the resulting waste.

Loss of Use /Quiet enjoyment and recreation/ OHV

The cumulative scale and scope of the loss of use, the loss of recreational opportunities, and the quiet enjoyment of our public lands when millions of acres are practically given away, fenced off, altered and transformed into private profit factories, is virtually off the charts and totally unconscionable. This also applies to the loss of and intrusion into designated OHV parks and routes.

Significant and Cumulative Impacts

Multiple renewable energy, transmission, and other projects, including SES Solar Two, high profile industrial wind turbines over 40 stories tall along western ridgelines on both sides of the US/Mexico border, and more potential wind turbines on BLM lands between Solar Two and the more elevated ridgeline projects, transmission and related infrastructure for renewable energy projects, mining projects, quasi military projects, and more, are currently proposed for over 2 million acres of BLM lands in the California Desert District and Eastern San Diego County, some private lands, and hundreds of thousands of acres in Northern Baja, mostly on communal Ejido lands. Separately and together, these projects will result in the following significant and cumulative impacts and more:

- Community Character and Values
- Loss of recreational and public use
- Loss of quiet enjoyment and sense of time and space
- Industrialization of rural communities and open spaces
- Loss of and damage to Cultural and Historical Resources
- Staggering Visual Resource and skylining impacts
- Landscape transformations and alterations
- Wildlife
- Habitat fragmentation and destruction
- Air quality, dust, and fugitive emissions
- Loss of dark skies (light pollution) and scientific resource value
- Increased traffic during construction, operation and maintenance
- Water resources including groundwater, imported water, and recycled water
- Increase soil erosion
- Diverted and denied recharge to fragile aquifers and sensitive habitat
- Disproportionate social and economic burdens to rural and low-income communities
- Environmental Justice issues
- Loss of carbon sink value of undisturbed desert soils
- Green House Gas emissions from increased project activities and manufacturing processes
- Infrastructure
- Traffic
- Utility rates
- Property Values
- Eminent Domain

BLM Land Appraisal /Rent monies paid to BLM / What are local benefits from rent payments

The appraisal of the BLM land to be used for this project needs to be an open and transparent process, with documents and assessments included in the public review process. The land value needs to include the project sites readily available access to utility transmission lines (both low and high-voltage) and substations, public roads and interstate highway, active rail line access, access to imported water from IID through a minimal pipeline extension (7 miles) from the West Side Main canal, existing industrial uses, US Gypsum's Plaster City, on adjacent land. All of these aspects

make the proposed land much more valuable than other more remote public lands. The lease price should properly reflect those values. What amount of rent money paid to BLM will go to benefit the local BLM lands and /or impacted communities? Or, will all the money go to the general fund as the community of Boulevard was informed when similar questions were asked about the rent monies from Iberdrola's proposed Tule Wind project on BLM land?

Bonding and decommissioning

I agree with the CEC and BLM staff concerns regarding the lack of adequate SES planning and response to questions regarding the funding for decommissioning the project site in the event of bankruptcy or other form of abandonment by the Applicant/Investors. The recent crash in prices for scrap metal and other commodities is part of the cyclical rise and fall of prices over time, and cannot be counted on to pay for the costs of decommissioning, or even to defray the costs. A legitimate and binding bond needs to be secured prior to any project approval or commencement of project activities that will cover any and all decommissioning costs. The tax payers do not need to foot yet another bill for this or any other projects built on public land.

A Better Way

There are far better ways to provide reliable renewable energy at or close to the point of use without this invasive and expensive 10-square mile project and the related and litigious Sunrise Powerlink transmission project. In addition to the previous information provided, please see the attached well researched article "The Better Way" by the Alliance for Responsible Energy Policy. It includes a comparison chart showing the disparity for impacts of point of use renewables and industrial scale wind and solar projects. There is more good information at their website at www.allianceforresponsiblenenergypolicy.com.

December 5th an article was printed in the San Diego Union Tribune regarding the City of San Diego's proposal to allow residents to pay for solar panels through their property tax bills over 20 years (http://www.signonsandiego.com/uniontrib/20081013/news_1n13solar.html). The County of San Diego is considering the same policy. The County also recently supported pursuit of state legislation for feed-in-tariffs for small generators. The Imperial County and IID can and should follow the same path to renewable energy production and independence.

The combination of the new 30% tax credit, being able to pay for solar panels through our property taxes, and the potential to get paid for excess self-generated energy, which is now donated back to the utilities, is the bright future we prefer. This will allow the average citizen, school, church, small businesses, and others to become part of the solution instead of being part of the problem. If feed-in-tariffs are approved (like we enjoyed in the 80's before the utilities killed them), it will also provide a further incentive for us to install a larger solar system than our home or business needs and to conserve energy so that more will be available to sell back to the grid. This scenario could represent the jump start to the real green energy future and green jobs that most people prefer, once they are provided with the facts and the opportunities. It can also help generate much needed extra income for families, communities, and organizations during these difficult economic times.

Conclusion

The rush to embrace massive and unnecessary projects like Stirling Energy Systems Solar Two, the Sunrise Powerlink, Iberdrola Renewables Tule Wind project, Sempra's La Rumorosa Wind project (in Mexico), and others throughout the region, should be compared to the rush to deregulate the energy market, to promote massive Ethanol production from corn, and to add MTBE to our gasoline which contaminated groundwater resources. All of these poorly vetted decisions resulted in incredibly expensive debacles with far reaching and unintended consequences that even the best minds have struggled and failed to fix. The old saying '*act in haste and repent at leisure*' applies to this and other decisions before you. Please deny the Application for Certification, for SES Solar Two. This very controversial project represents yet another incredibly expensive debacle with far reaching and unintended consequences. Now is not the time to further burden struggling ratepayers with billions of dollars that will be paid for through massive rate increases—there is a *better way*, and we are counting on you to help us get there.

Sincerely,

Donna Tisdale

September 10, 2008

POWERS ENGINEERING NOTICE OF EX PARTE COMMUNICATION

On September 4, 2008, from 10 to 11 am at the offices of Powers Engineering in San Diego, Bill Powers, P.E., principal, Powers Engineering, met with Thomas Del Monte, intern to Commissioner Bohn. Communication was oral and written.

Mr. Powers addressed the rapid evolution of thin-film PV and the fact that thin-film PV is now demonstrably the lowest cost, on a \$/MWh basis, of any commercially available solar energy technology. He noted that Sempra Energy had announced plans to install 100s of MW of thin-film PV at its power plants in Nevada and Arizona. He also addressed the pre-commercial nature of dish Stirling technology. Mr. Powers expressed the opinion that the considerably higher \$/kWh rate by the utilities for on-peak point-of-use PV compared to the market price referent (MPR), and the: 1) lack of need in urban/suburban locations for new transmission to serve this generation, 2) lack of significant T&D losses, up to 14% at peak, associated with remote generation, 3) the presumed CEQA exemption for PV arrays on existing rooftops and in existing parking areas, and 4) the lack of need to dedicate any new urban or suburban land to develop the PV capacity (as it would on existing rooftops and parking areas), makes saturation deployment of PV in the urban/suburban core the most financially sound strategy for PV development, not large-scale development of PV (or any other solar technology) at remote sites dependent on new transmission to serve load centers. Mr. Powers also provided Mr. Del Monte with the following documents:

1. June 26, 2008 ex parte meeting notification of meeting between Bill Powers and Commissioner Bohn staff in San Francisco (with attachments). This notification with attachments was served on all parties to the A.06-08-010 proceeding on June 26, 2008.
2. June 27, 2008 ex parte meeting notification of meeting between Bill Powers and Commissioner Bohn staff in San Francisco. This notification includes additional documents provided to Commissioner Bohn staff at the ex parte meeting (with attachments). This notification with attachments was served on all parties to the A.06-08-010 proceeding on June 27, 2008.

3. August 11, 2008 UCAN protest submitted in proceeding A.08-07-017, Application of San Diego Gas & Electric Company (U 902 E) for Approval of the SDG&E Solar Energy Project.
4. June 1, 2007 A.06-08-010 Phase I direct testimony of Dr. Barry Butler.
5. E-mail print-out summarizing Sempra Energy plans to add 100s of MW of thin-film PV at Sempra power plants in Nevada and Arizona, and Renewable Energy World August 20, 2008 article titled "Creating Realistic Expectations for Renewable Energy". The article includes a case study of dish Stirling solar technology.
6. Summary of transmission capacity serving California and U.S. and California transmission maps.
7. Sept. 4, 2008 e-mail from Bill Powers to Thomas Del Monte with links to the Renewable Energy Transmission Initiative draft Phase 1B report and the 2007 Integrated Energy Policy Report.

The last three documents are included as attachments to this notice. In addition, Mr. Powers committed to provided Mr. Del Monte with a hardcopy of *San Diego Smart Energy 2020*. *San Diego Smart Energy 2020* describes a distributed generation alternative to the Sunrise Powerlink and is a part of the A.06-08-010 record.

For a copy of this notice, please contact Bill Powers, P.E. at (619) 295-2072 or by e-mail at bpowers@powersengineering.com.

Respectfully submitted,

/s/ _____

SDG&E parent Sempra just committed to a legitimately low-cost commercially proven solar technology, 10 MW of First Solar thin-film PV at the Boulder City, NV site of Sempra's 480 MW El Dorado combined-cycle plant. The project is supposed to be operational by the end of the year. Sempra says it will add 40 to 50 MW of thin-film PV to the project next year. Sempra criticizes solar thermal in the attached Reuters article, saying thin-film PV is the way to go. Sempra indicates it also wants to build 300 to 400 MW of thin-film PV in Arizona. There is no mention of dish Stirling anywhere in the article.

SDG&E says it will add 35 MW of high cost tracking PV in the San Diego area over 5 years under the solar project the company proposed to the CPUC in July 2008. Why is SDG&E implying it is a stretch to add 6 or 7 MW of PV per year when parent Sempra is committing to 10x as much solar per year now at one site using a much lower cost PV technology (fixed plate thin-film PV)? The 300 to 400 MW of thin-film PV in Arizona mentioned by Sempra implies the company sees no hurdles to installing cost-effective PV at a rate of 100s of MW per year.

Sempra also states there is a land rush going on and it is getting tougher to find good sites on transmission lines. What Sempra does not say is that there is an almost unlimited amount of disturbed land, aka commercial rooftops and parking lots, in California and Arizona urban areas where thin-film PV could be sited with no transmission requirements and no land acquisition costs (or CEQA issues) along the lines of the SCE commercial rooftop PV project in San Bernardino and Riverside.

I know I have already sent this, but it is a wonderful juxtaposition to Sempra's born-again commitment to thin-film PV as the solar energy technology of choice. About the last quarter of the Renewable Energy World article (link below) looks at SES dish Stirling as a company creating unrealistic expectations based on untested assumptions about cost and performance.

Bill

Creating Realistic Expectations for Renewable Energy

by Stephen Lacey, Staff Writer

August 20, 2008 - New Hampshire, United States

It's a delicate time for the renewable energy industry. Now that the public eye is focused more intensely on clean energy technologies, there are a lot of high expectations about their potential. Properly educating consumers, investors and journalists about what each technology can realistically offer will be one of the most important factors in moving renewables forward, say industry professionals.

At the consumer level, that means encouraging buyers to do the necessary research about the product they're purchasing and the company they're working with. If buyers don't really know what they are getting, that could make for a less-than-satisfactory experience < or even worse, a situation where the customer gets scammed.

Sue Kateley, Executive Director of the California Solar Energy Industries Association, says she sees a growing number of scammers getting into the solar industry who are making overblown claims about energy output and estimated return on investment. In the last few months, she has received three different calls from consumers in California who had large deposits taken from them by sketchy installers who made promises they couldn't deliver.

In two cases, customers put down US \$40,000 for a deposit and never got the system installed. In one case, a customer put down US \$105,840 for a deposit on a system even though they were unsure about the relationship. By the time they had second thoughts about the installer, the contract was signed and the check was cashed.

"In doing some further investigation, it doesn't really look like these are solar companies. It looks like these are opportunists...that are setting up websites and opening an office...and they're just going around and taking advantage of unsuspecting people," says Kateley.

With aggressive solar targets and a robust incentive structure in California, scammers see a big opportunity to take advantage of uneducated consumers, she says. And as other states continue to increase their support for solar, the problem will undoubtedly spread to other states. The only way to stop this from happening, says Kateley, is to teach people how to make smart decisions when purchasing solar or other renewables. That means knowing how to find a licensed contractor, understanding what's in a contract, and most importantly, knowing how solar works.

"I think that anytime you have a lot of government and public attention on going green, people don't know really what that means. And since customers don't tend to do a lot of due diligence themselves, they really are taking on faith that the person who's selling them this product will treat them well. I think that's the problem that I see picking up - the green movement has brought in some snake oil-type practices and that's very sad."

The situation is similar to that of the late 1970's and early 1980's when the booming solar hot water industry attracted a number of scammers who put up shoddy systems. Many Americans lost confidence in the technology and the solar hot water industry still hasn't fully recovered. This time around, scammers in the solar-photovoltaic industry have gotten more hi-tech. The internet has made it easier for people to set up a professional looking website and lure consumers with flashy promotions and complicated jargon.

The residential wind industry is experiencing a very similar issue, says Wind Energy Expert Mick Sagrillo. He sees the same type of scammers setting up websites promoting new vertical axis turbines and publishing theoretical

performance data that has no relevance to the actual output of a system. Many of these devices are untested and are being promoted by people who know they have a questionable technology, he says. If someone buys a poorly-made turbine and it malfunctions, the consumer's problem turns into a public problem.

"When you put a solar system on your roof and it doesn't work, nobody will be able to tell. When you put a small wind turbine on your roof or in your backyard and it doesn't work, the whole neighborhood knows. That could have a lasting effect on someone's opinion about wind. We have to make sure people are making smart purchases so that we maintain confidence in these technologies," says Sagrillo.

The main reason that sham companies are able to thrive, he says, is that people don't really understand energy. If someone doesn't know what type of performance data to look for, the potential for them to get dazzled by overblown or false claims about a technology increases. As founder of the wind-installation company Lake Michigan Wind and Sun, Sagrillo gets a large number of people looking into wind generators because of the rising cost of gasoline. The fact that people equate electricity generation with gasoline shows how uneducated many Americans are about energy, he says.

"It's great that people are looking for alternatives, but it's amazing how little people know when they seek them out. That leaves people open to purchasing a product that is less-than-reliable. We are a very gullible culture, we're always looking for the magic bullet," says Sagrillo.

That magic bullet thinking is spread by the mainstream media, Sagrillo says. Too many journalists take company claims about cost, performance, and project timelines at face value. He believes that lack of critical analysis is passed on to consumers.

Technology Journalist Peter Fairley agrees. If companies are allowed to make claims they can't deliver on, that may damage public confidence in certain technologies, he says. Too often, companies don't release enough information to properly evaluate claims about the economics or energy output of a product.

"It's critical for us to point out when companies are not answering questions. There's a lot of hype around certain companies that are being very secretive and where there's real potential for not only investors to get hurt, but also for the image of the industry...to be hurt."

One of the more secretive companies in the industry has been Arizona-based Stirling Energy Systems (SES). The company plans to roll out

300 megawatts (MW) of its Dish/Stirling systems in Southern California by 2010 for around US \$1.50 per watt. After that, the company says it will scale up to 900 MW, but it has not issued a timeline for the expansion. There are plans for another project which could eventually bring the total installed capacity of Dish/Stirling systems in California to 1,750 MW.

But Barry Butler, an engineer with 30 years of experience with solar thermal electric technologies, says that SES is not being honest about the realities of its proposal. He's worked with Dish/Stirling devices and believes they have a lot of potential. But "to claim that you could do it for \$1.50 a watt, which is just a little more than a gas turbine, it isn't physically possible. You can't buy the materials and assemble a 16,000 pound dish for that. It defies the laws of physics, materials procurement and materials costs," he says.

In addition, says Butler, rolling out 12,000 Stirling Dishes by 2010 is theoretically possible, but it doesn't take into account any of the reliability issues that the company may face. Right now, there are only six dishes operating today. A more realistic timeline would be to roll out 1 MW (40 dishes) for a year of testing, then move to 10 MW and eventually to 300 MW. Even at such a large scale, SES may be looking at an installed cost of around US \$7.00 per watt, he says.

"They're going to buy 12,000 engines that they've never bought before and put them on dishes and expect to generate power. It's just highly unlikely. They're probably looking at 2020," Butler predicts.

SES declined three interview requests for this story.

There have been a number of stories in the media hailing the SES projects as the next big thing for solar. Butler says that none of them have critically evaluated the issues associated with cost, reliability and timeframe for development.

That type of unchecked enthusiasm is not the way to build a sustainable industry, says Fairley, the journalist. The best way to educate people about the potential of renewable energy is to be realistic about what the technologies can offer.

"One of the failings of technology journalism over the years has often been a tendency to focus on the technical potential of new products to the exclusion of the present technical challenges that need to be overcome. It's important for us to always be flagging those challenges," says Fairley.

Import Capacity of Transmission Lines Serving Southern California

The alternating current transmission import capacity currently serving Southern California, via Path 46 and Path 26, is approximately 14,000 MW. The direct current transmission import capacity currently serving Southern California, via the Pacific Intertie and the Intermountain DC transmission lines, is approximately 5,000 MW. Total import capacity is approximately 19,000 MW.

The three Southern California utilities that utilize this import capacity are Southern California Edison (SCE), San Diego Gas & Electric (SDG&E), and the Los Angeles Department of Water and Power (LADWP). These three utilities have collective average annual electricity retail sales of approximately 14,000 MW, and a collective peak demand of approximately 33,000 MW.¹ The peak demand and annual retail sales for each utility are shown in the table below.

Utility	SCE ²	LADWP ³	SDG&E ⁴	Totals
2007 peak demand, megawatt (MW)	23,000	5,700	4,600	33,000
2006 annual retail electricity sales, gigawatt-hr, (GWh)	79,000	23,000	17,000	119,000

1 GWh = 1,000 MWh

I. Path 46, Southern NV and Western AZ to SoCal, capacity: 10,100 MW

Source: http://www.nationmaster.com/encyclopedia/Path-46#Map_of_all_the_500_kV_wires

The entire Path 46 system has a capacity of transmitting 10,100 MW of electrical power to the population centers of Southern California. The source of the electricity is hydroelectric dams like Hoover Dam on the Colorado River, fossil fuel plants like the clusters of natural gas-fired plants in the Las Vegas area and western Arizona and coal plants in various western states, and nuclear power from the Palo Verde Nuclear Plant in western Arizona.

II. Path 26: Northern CA to Southern CA, capacity: 3,700 MW

Path 26 is a set of three 500 kV transmission lines that is the SCE intertie with Pacific Gas & Electric (PG&E) to the north. The Path is located in the southern Central Valley of California (San Joaquin Valley), the Tehachapi and Transverse Ranges, and the High Desert area. The three Path 26 500 kV lines can transmit 3,700 MW north to south (http://en.wikipedia.org/wiki/Path_26).

III. Pacific DC Intertie: Oregon to LA, capacity: 3,100 MW

The Pacific DC Intertie (also called Path 65) is a transmission line from the Pacific Northwest to the Los Angeles area using high voltage direct current (HVDC). The line capacity is 3,100 MW, which is enough to serve two to three million Los Angeles households.

IV. Intermountain DC Line: Utah to LA, capacity: 1,920 MW

Intermountain is the designation of a HVDC transmission line between the Intermountain Power Plant in Utah and Los Angeles. The Intermountain is an overhead line with a length of 785 km that can transfer up to 1,920 MW at 500kV.

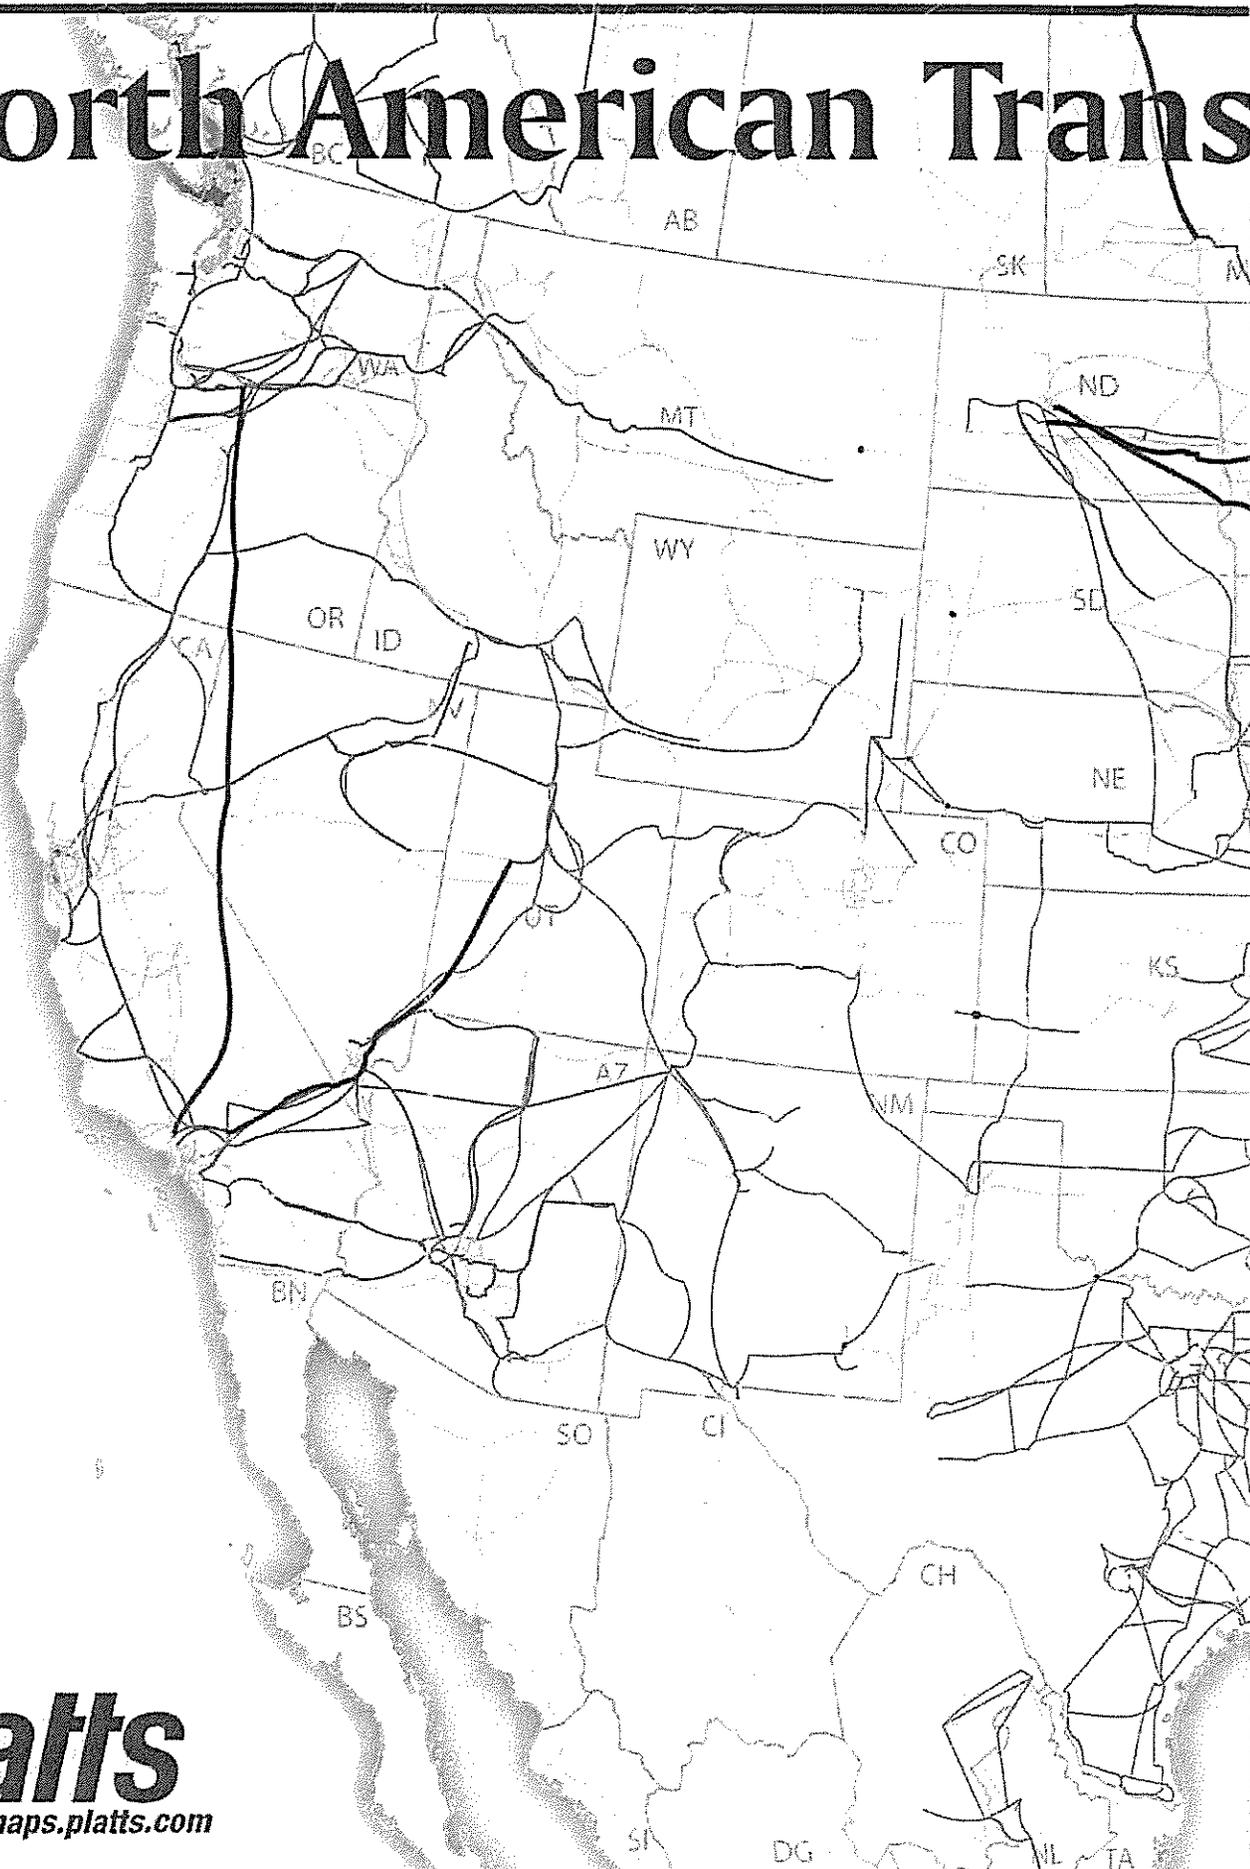

¹ The combined annual average retail sales of the three utilities is calculated by dividing the annual retail sales of 119,000,000 MW-hr by 8,760 hours in a year. $119,000,000 \text{ MWh/yr} \div 8,760 \text{ hr/yr} = 13,600 \text{ MW}$.

² SCE peak demand: Business Wire, *SCE customers use record amount of electricity today*, August 31, 2007. SCE annual retail electricity sales: CEC, *2007 Integrated Energy Policy Report*, January 2008, p. 128.

³ E. Martinez – COO LADWP, *Planning to meet the challenge*, PowerPoint presentation, January 19, 2006. The 2005 peak demand of 5,667 MW identified in this presentation is higher than the 2007 peak demand projection of 5,400 MW.

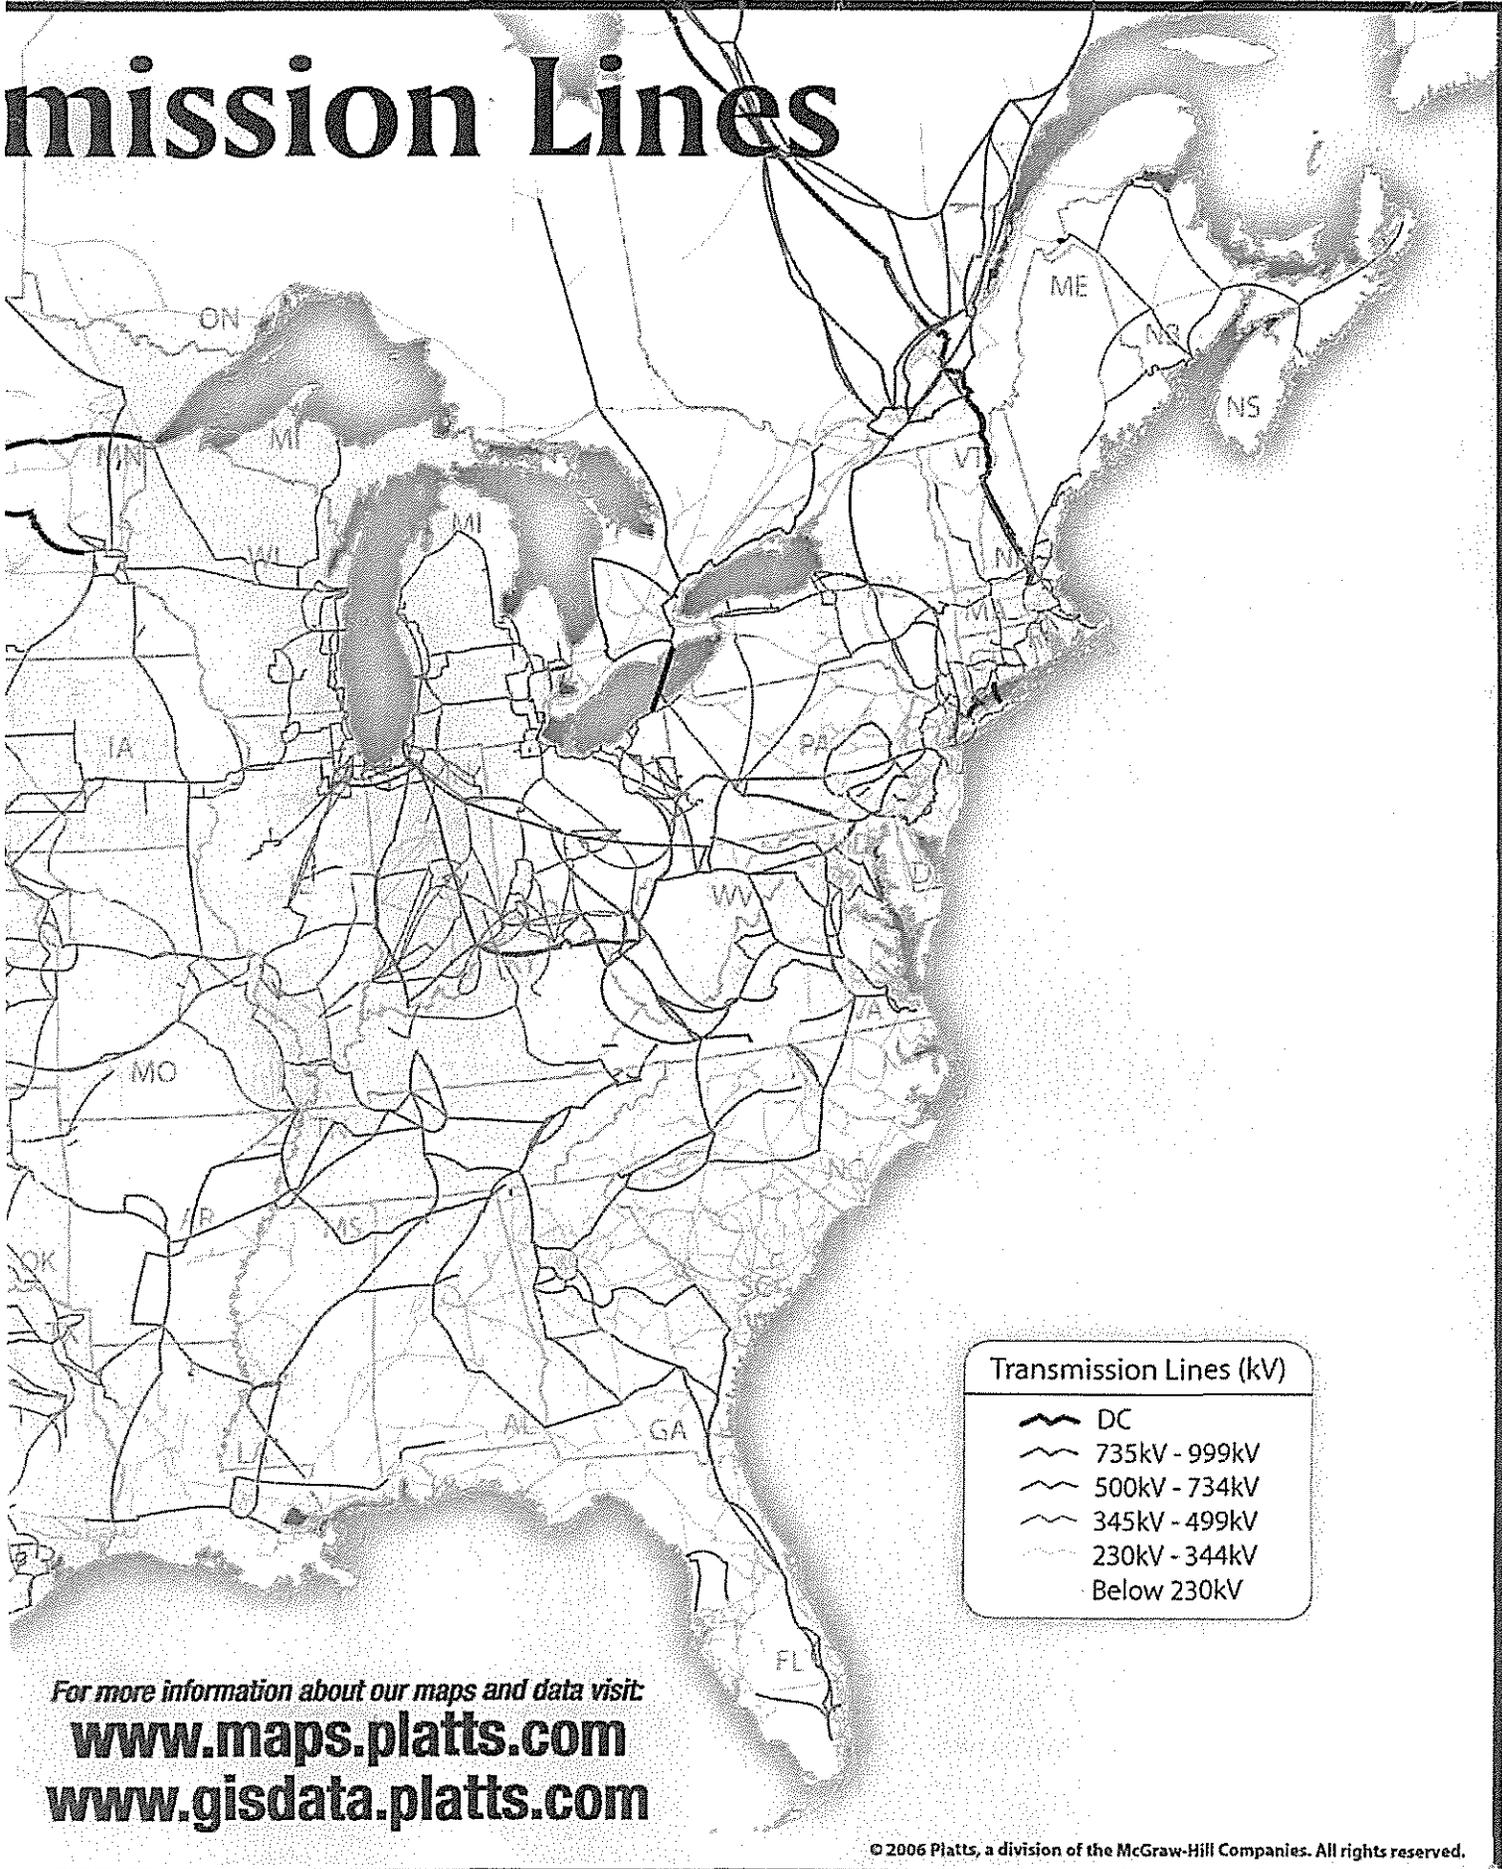

⁴ SDG&E peak demand: US News, *Southern California sets power records*, September 4, 2007. SDG&E annual retail electricity sales: CEC, *2007 Integrated Energy Policy Report*, January 2008, p. 128.

COMMISSION

STRATEGIC TRANSMISSION INVESTMENT PLAN

COMMISSION REPORT

Prepared in Support of the *2005 Integrated Energy
Policy Report* Proceeding (04-IEP-1K)

NOVEMBER 2005
CEC 100-2005-006-CMF

Arnold Schwarzenegger, Governor

Bill Powers

From: Bill Powers [bpowers@powersengineering.com]
Sent: Thursday, September 04, 2008 11:19 AM
To: 'Thomas Del Monte'
Subject: additional information

Thomas,

Polycrystalline silicon PV and thin-film PV cost estimates are included on pdf p. 63 (p. 6-7) of the August 2008 RETI Phase 1B draft report: See:

http://www.energy.ca.gov/reti/documents/2008-08-16_PHASE_1B_DRAFT_RESOURCE_REPORT.PDF

Also, the CEC 2007 IEPR notes (p. 143) the much higher value of on-peak point-of-use PV compared to the market price referent (MPR). The 2007 IEPR notes that SCE pays 3.28 times the MPR for on-peak commercial PV. Slightly higher installed capital costs for thin-film PV systems spread over many commercial buildings and parking lots, compared to putting 500 MW or 1,000 MW on one contiguous utility-scale site in a remote area, would be more than offset by the much higher composite value (of on-peak and off-peak hours) of point-of-use PV within the load center. See: <http://www.energy.ca.gov/2007publications/CEC-100-2007-008/CEC-100-2007-008-CMF.PDF>

I will include this e-mail as an attachment to the ex parte notification I file on today's meeting.

BEFORE THE PUBLIC UTILITIES COMMISSION
OF THE STATE OF CALIFORNIA

In the Matter of the Application of San Diego Gas
& Electric Company (U 902 E) for a Certificate of
Public Convenience and Necessity for the Sunrise
Powerlink Transmission Project.

Application 06-08-010
(Filed August 4, 2006)

**MOTION OF THE
ZEMER ENERGIA
FOR PARTY STATUS**

Zemer Energia (ZEMER) respectfully moves for party status in this proceeding, Application (A.) 06-08-010. This Motion is filed pursuant to Rule 1.4 of the Commission's Rules of Practice and Procedure.¹

**I.
DESCRIPTION OF ZEMER ENERGIA**

Zemer Energia (ZEMER) is a subsidiary of Unión Fenosa , a leading international energy company, and the third largest electric utility in Spain. In México, Unión Fenosa currently owns and operates 1,550 MW of natural gas combined cycle generation with another 450 MW combined cycle generation facility currently under construction. ZEMER was established to develop renewable energy generation projects for the Mexican and California electricity markets. Union Fenosa currently has approximately 1,230 MW of wind power under development in México, of which 1,000 MW are located in northern Baja California, in an area adjacent to the border with California known as "La Rumorosa".

The wind projects at La Rumorosa are part of Union Fenosa's €9,000 million Euro global strategic investment plan "BIGGER", of which €1,500 million Euros are specifically earmarked

¹ Rule 1.4 of the Commission's Rules of Practice and Procedure permits a person to become a party to a proceeding by, among other things, filing a motion to become a party. A person filing such a motion must disclose the identity of the persons or entities in whose behalf the motion is made and the interest of such persons or entities in the proceeding. The

for projects in México. Union Fenosa plans to build the projects with its own resources without seeking external sources of financing. The initial 500 MW of La Rumorosa wind electric generation were bid in the 2008 RPS solicitations and are currently in contract negotiations. ZEMER is actively seeking additional off-takers among California utilities for the remaining 500 MW output of its La Rumorosa wind project.

ZEMER has considered various transmission routes for the energy output of its proposed La Rumorosa wind generation facilities. To this end, a Union Fenosa subsidiary submitted two separate interconnection applications to the CAISO with interconnection points at the Miguel and Imperial Valley substations. One of these applications, for interconnection to Imperial Valley Substation (IVSS) is now part of the CAISO transition cluster, having paid all earnest fees due and having demonstrated proof of land control to CAISO's satisfaction.

Pending the outcome of CAISO's transition cluster study, ZEMER will build the necessary transmission infrastructure between its La Rumorosa wind farm and the first interconnection point to the WECC system. The current plan for interconnecting the first 500 MW of the project, calls for the construction of a 230-kV transmission line from its La Rumorosa to a point due south of the Imperial Valley Substation, and for the use of an existing cross-border line to IVSS. The schedule calls for the completion the first 500 MW and associated infrastructure by late-2011, in time for delivery under its RPS. The second 500 MW of wind capacity will require the construction of a new cross-border line to interconnect to IVSS or to a less distant interconnection point to be identified upon completion of the CAISO clustering study.

II.

ZEMER'S INTEREST IN THIS PROCEEDING

On October 31, 2008, the Commission mailed a Proposed Decision and an Alternate Proposed Decision in this proceeding. The Proposed Decision denies San Diego Gas and Electric Company's (SDG&E's) request for a CPCN to build the Sunrise Powerlink Transmission Project (Sunrise). The Alternate Proposed Decision approves the CPCN, but adds conditions to that approval. Specifically, the Alternate Proposed Decision requires SDG&E to file a compliance plan that, among other things, must "specify the renewable generation that will be developed and delivered on Sunrise."² In meeting this condition, SDG&E is required to provide significant detail about these projects, including expected binding commitments, project descriptions, and project construction schedules.³

As ZEMER's wind generation project in La Rumorosa will need sufficient transmission capacity from IVSS, or another point, to reach the California off-takers, ZEMER has a direct interest in these conditions and believes it can provide valuable input through comments and reply comments on the Alternate Proposed Decision and the Proposed Decision and the further rulings and additional Alternate Proposed Decision (President Peevey) that have now been issued in this proceeding. Further, only when this Alternate Proposed Decision was issued and became the subject of an oral argument and an all-party meeting over the last few weeks did ZEMER become fully aware of the impact of conditions that may be imposed by the Commission in authorizing the Sunrise Powerlink transmission line.

ZEMER, therefore, seeks party status to provide these written comments and participate on any further all-party meetings or oral argument on these proposed decisions, as well as any and all other related Commission actions and future phases of this proceeding. Because ZEMER's interest in this proceeding has emerged as a result of the conditions proposed by the

² Alternative Proposed Decision, Ordering Paragraph 2, at p. 284.

Alternate Proposed Decision, ZEMER's motion is timely and its contentions will be reasonably pertinent to the issues already presented in this proceeding. Finally, ZEMER's participation in this proceeding will not prejudice any existing party.

**III.
CONTACT INFORMATION**

On behalf of ZEMER, the following name and information should be included in the "Party" portion of the service list for A.06-08-010:

**Nicolas Puga/Bates White, LLC for
Zemer Energia, S.A. de C.V.**
1300 Eye Street NW, Suite 600
Washington, DC 20005
Telephone: 202/652-2184
Facsimile: 202/408-7838
Email: nick.puga@bateswhite.com

³ Alternative Proposed Decision, Ordering Paragraph 2, subparts (a) – (c), at pp. 284-285.

**IV.
CONCLUSION**

ZEMER clearly has a pertinent and substantial interest in, and would be affected by, the Proposed Decision and Alternate Proposed Decision mailed in this application on October 31, 2008, and the further Alternate Proposed Decision mailed on November 18, 2008. Until the first Alternate Proposed Decision was issued, ZEMER did not know that conditions would be imposed that would directly affect its interests. ZEMER has, therefore, timely sought to become a party to this application and respectfully moves the Commission to grant ZEMER party status in A.06-08-010 to permit ZEMER to submit written comments on these proposed decisions and the further Alternate Proposed Decision and fully participate in all aspects of this proceeding from this date forward.

Respectfully submitted,

December 9, 2008

CPUC now limits utility baseload long-term power contracts to sources with a GHG footprint of a natural gas-fired combined cycle power plant. This is high-cost baseload power generation in a time when natural gas averages \$7 per million Btu or more. According to DOE, cost parity will be reached by 2015 if PV is incentivized to ensure a large and growing market over the next decade. See the lower curve in Figure 10-1.

Figure 10-1. DOE Projection of Decline in PV Cost Through 2020¹³⁴

There are currently limits on the availability of PV panels. However, a very rapid expansion of PV manufacturing capacity is underway. Worldwide PV manufacturing capacity expanded 41 percent in 2006. Production is currently constrained by a shortage of manufacturing capacity. However, more than a dozen companies in Europe, China, Japan, and the U.S. will bring unprecedented levels of production capacity online in the next two years, reversing manufacturing constraints. The cost of PV is expected to decline 40 percent by 2010 as a result of this tremendous expansion in PV production capacity.¹³⁵

The 2,040 MW of PV to be added under the *San Diego Solar Initiative* would be equipped with sufficient battery storage, equivalent to 2 to 3 hours of rated capacity, to enable this PV capacity to be dispatchable during the late afternoon peak. 2,040 MW of PV capacity would meet more than half of San Diego County's project peak demand (under *San Diego Smart Energy 2020*) of 3,500 MW in 2020.

PV systems provide peak power output in the middle of the day, yet peak demand is generally later in the afternoon, typically 3 pm to 6 pm. The CEC is funding a demonstration in Southern California Edison territory of sophisticated energy management/battery systems integrated with

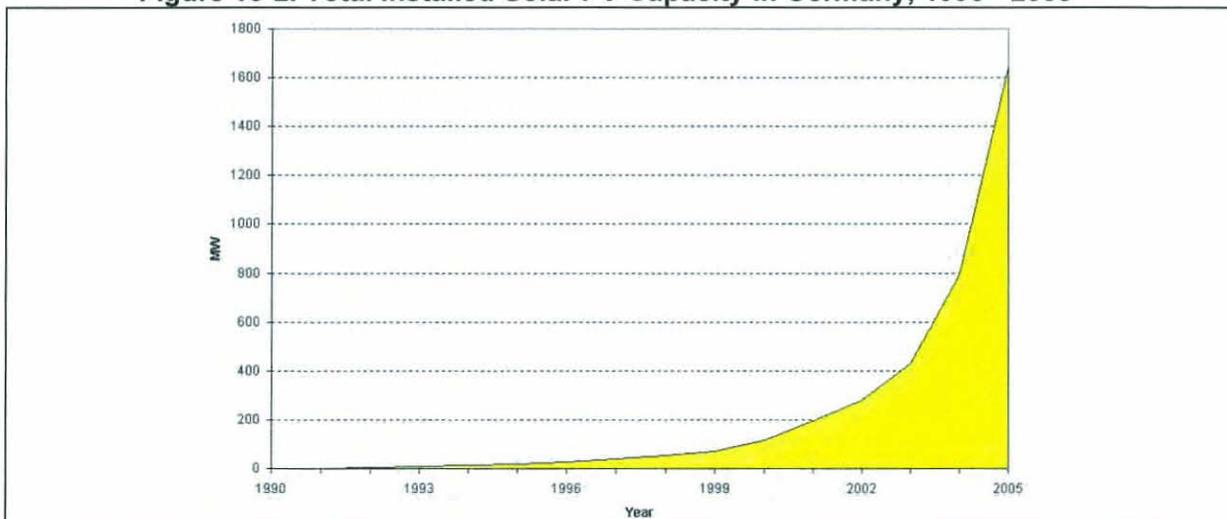

residential PV to serve as peaking units to meet the late afternoon summertime peak.¹³⁶ The energy management/battery systems are fully controllable by the utility as peaking units. The addition of energy management and battery storage allows the PV system to supply the utility grid with its peak output through the late afternoon summertime demand peak. The energy management/battery system adds approximately 10 percent to the cost of the PV system.¹³⁷

The San Diego region is projected to have approximately 4,600 MW of PV technical potential on commercial, buildings, parking structures, and parking lots in 2010, as well as 2,800 MW of technical potential on residential structures.¹³⁸ The 2,040 MW PV target will be developed from this 7,400 MW of PV technical resource base.

The annual energy production of this PV capacity developed under the *San Diego Solar Initiative* will be approximately 25 percent of the region's annual energy demand in 2020. SDG&E is obligated by SB 107 to obtain 20 percent of its power sales from renewable energy sources by 2010. An assumption in *San Diego Smart Energy 2020* is that the energy generated by these renewable energy contracts, 3,500 GWh-year, continues to be produced at the 3,500 GWh per year level for the foreseeable future. 3,500 GWh will be approximately 22 percent of total energy demand in 2020. The 300 MW of regional PV added under SB1 will supply 3 percent of total energy demand. Combined, these renewable energy sources will provide 50 percent of the region's annual energy demand in 2020.

The *San Diego Solar Initiative* would follow a development curve, in terms of rate of growth in installed PV power, similar to the rate-of-growth demonstrated in the German PV program. The German PV program reached a growth rate of 837 MW per year in 2005. See Figure 10-2. The *San Diego Solar Initiative* would start gradually and finish fast. Approximately 40 MW would be installed in 2008-2010, the first three years of the *Initiative*. 2,040 MW would be in operation by 2020.

Figure 10-2. Total Installed Solar PV Capacity in Germany, 1990 - 2005¹³⁹

10.2.2 Greenhouse Gas Reduction Achievable with \$700 Million Photovoltaics Incentive Budget

California utilities have historically been responsible for recovering 100 percent of the cost of their transmission investments from their own ratepayers. However in 2000 the Federal Energy Regulatory Commission instituted a new cost allocation procedure for transmission projects.¹⁴⁰ Transmission costs for such projects are now borne proportionately by the state's three regulated utilities, SCE, PG&E, and SDG&E, regardless of the utility territory where the project is actually located. The SDG&E customer base represents approximately 10 percent of the customer base of the three utilities combined. As a result, even though the cost of SPL will be \$7 billion to \$8.3 billion (2010 dollars) over the financial life of the project, SDG&E customers will pay only 10 percent of this cost, \$700 to \$830 million, over the 40-year financial life of SPL. SDG&E customers also pay 10 percent of SCE and PG&E transmission projects.

Under the current rules of transmission line cost allocation, SDG&E customers will pay \$700 to \$830 million of the total cost. It is therefore of value to determine how much PV could be installed in the San Diego County area with an incentive budget of \$700 to \$830 million, given that is the amount that these SDG&E ratepayers will be charged for the SPL.

A \$700 million budget would incentivize the installation of 1,030 MW of PV without battery storage in the San Diego region by 2020. Assuming 10 percent of the \$700 million incentive budget is used for energy management/battery systems and the remaining 90 percent for PV capacity, approximately 920 MW of PV capacity would be installed that is capable of operating at rated output throughout the afternoon 3 pm to 6 pm peak summertime demand period. An \$830 million budget would incentivize the installation of 1,220 MW of PV without battery storage, and 1,100 MW with battery storage to maintain rated output through the afternoon peak. The distribution of the \$700 million in PV incentives is shown in the PV incentive program financing plan summary tables included in **Attachment K**.

How does this projection compare to the projection for the CSI program? The objective of the CSI \$2.165 billion incentive budget is to increase installed PV capacity in California to 1,940 MW by 2017. A \$700 million incentive budget is one-third the CSI incentive budget of \$2.165 billion. The approximate installed PV capacity that could be expected from a \$700 million incentive budget under CSI would be in the range of 650 MW (without battery storage), one-third the CSI target of 1,940 MW.

10.2.3. Displacement of PV with Concentrating Solar and Wind

The overall cost of the renewable energy portfolio to achieve 50 percent greenhouse reduction by 2020 will decline to the degree that renewable energy parks develop in the more rural areas of San Diego County, using concentrating PV or a concentrating solar technology of similar efficiency, and these parks displace a portion of the 2,040 MW of fixed PV capacity that would result from the *San Diego Solar Initiative*. These renewable energy parks are discussed in more detail in Section 13. To the degree that wind power substitutes for this fixed PV capacity, assuming no new transmission must be built to accommodate that wind power, the cost to

achieve the 50 percent greenhouse gas reduction by 2020 will drop further. Regional wind power is discussed in more detail in Section 14.

10.3 Coordinating PV Installations with Roof Replacements

Commercial and residential PV installations can be coordinated with roof replacements to maximize efficiencies. The typical service life of roofing material is 20 to 25 years. The typical guarantee period for solar panels is 25 years. Timing the PV installation with a new roof means the entire roof and PV system will have a coordinated minimum service life in the range of 25 years.

San Diego City Schools contracted the integrated re-roofing and installation of a total of 5,110 kW of PV power on fourteen schools to Solar Integrated, Inc. (Los Angeles). The contractual arrangement is a long-term power purchase agreement, where Solar Integrated owns the roofs and the PV panels. Solar Integrated manufactures the high efficiency “cool roof” (http://www.solarintegrated.com/non_pv.htm) and adds PV as a component of the roof installation.

City Schools is charged a fixed \$/kWh rate for all PV power generated. This rate is significantly below the rate City Schools would otherwise pay SDG&E for utility power.¹⁴¹ This is one example of a relatively painless financing and ownership model that could be employed at hundreds of commercial sites in the San Diego region if an adequate incentive budget is available. Figure 10-3 shows the San Diego Education Center equipped with a cool roof and 100 kW of rooftop PV.

Figure 10-3. San Diego Education Center with High Efficiency Roof and PV

11. Renewable Energy Tariffs: The Key is Rates that Reflect Actual Value

A fundamental assumption of SB1 and the proposed *San Diego Solar Initiative* programs is that PV costs will decline steadily over the next decade, to the point that PV will compete without

incentives against natural gas-fired generation. However, there are other proven financing mechanisms, available to achieve rapid renewable energy development. One of these mechanisms is a “standard offer” for this renewable power offered by the utilities that is sufficiently generous that the renewable energy power producer receives a fair return on the renewable power investment.

The use of standard offer prices for renewable energy projects is a proven model for assuring the financing of innovative renewable energy projects. Thousands of MW of renewable wind, solar, and geothermal projects were built in California in the 1980s as a direct result of the standard offer contract structure. This is the format that used in the San Diego region with “qualifying facilities,” larger cogeneration plants that produce steam from industrial or commercial use and power primarily (though not exclusively) for export to SDG&E.

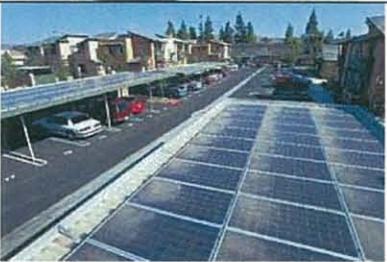

Last year 10,000 MW of wind power were installed in Europe, primarily in countries with feed-in tariffs. “Feed-in tariff” means the renewable energy producer is paid a fixed rate for the renewable power sold to the grid.

Renewable energy development in the U.S. is contingent on the federal production tax credit at present. This program has been essential in the U.S. for promoting wind power. However, it has also suffered from three principal drawbacks. First, it has been an “on again, off again” tax credit, subjecting the industry to boom and bust cycles. Second, the credit originally only applied to wind, though it was extended to other types of renewable energy in the 2005 Energy Policy Act. The two-year cycle of expiration of this tax credit creates a challenging timeframe for renewable projects other than wind. Third, it only supports projects for the first 10 years, making it less helpful than the German solar tariff which pays projects for 20 years. Twenty years is much closer to a realistic financial lifecycle for solar projects. Fourth, it only applies to commercial (private) developers who can take tax credits. Government agencies, municipal utilities like Los Angeles Department of Water and Power and Imperial Irrigation District and other non-profit entities, are ineligible.

In Europe, feed-in tariffs are set either at a fixed price, or a fixed premium above spot market prices. Price levels and premiums vary by technology, reflecting variation in technology costs. Incentives vary by country. Incentives for some technologies are scheduled to decline over time. California is currently implementing two programs with incentives similar to feed-in tariffs. As part of the California Solar Initiative, the CPUC has developed performance-based incentives with set payments per kWh for qualifying solar photovoltaic systems. The CPUC is also implementing a process to determine a tariff rate that will be offered to public water or wastewater agencies for renewable generation and whether this or a similar tariff should be used to spur additional renewable resource development.

The renewable energy payments need to be fully justifiable based upon a real mix of value factors, so it is not in fact or perception a subsidy or special handout. This is the foundation for the German feed-in tariff for solar energy. The German government calculated how much solar peak energy was worth, adding up the electric value, the social value, the environmental value, and the future risk hedge value. The feed-in tariff is not a charity payment, but a payment for real value delivered. European countries that do not set tariffs high enough have not been nearly as successful as those with fixed, long-term rates that are reasonably generous.

12. Approaching Carbon Neutral Now: Local Examples of Cutting-Edge Facilities

<p>San Diego City Schools, 5,110 kW of PV: Photo at right is the roof of the Juarez Elementary school. The PV output from this installation is 67 kW. City Schools has a long-term power purchase agreement with Solar Integrated (Los Angeles). A total of 14 schools have been re-roofed using high efficiency “cool roofs” that serve as a platform for the PV arrays. Solar Integrated owns and maintains the roofs and the PV systems. City Schools pays a flat \$/kWh rate for the power generated by the PV systems. This rate is significantly below the rate City Schools would otherwise pay SDG&E for electricity.</p>	
<p>City of San Diego, Alvarado Water Treatment Plant: This 945 kW PV system was built via a long-term power purchase agreement with SunEdison. The city pays SunEdison \$0.12/kWh, offsetting a current utility rate of approximately \$0.17/kWh.</p>	
<p>Qualcomm Building W Campus, Sorrento Valley: The 250 kW PV array is installed on the roof of the building and the shade structure of the parking garage. The PV output is sufficient to support all lighting requirements for the building, parking structure and onsite cogeneration plant. Efficiency improvements, including high efficiency lighting fixtures, gas absorption chillers, boilers, and water heaters, have combined to reduce electricity consumption by 30 percent.</p>	
<p>Solara housing complex, Poway: This housing complex is the first of its kind in the state: a green-built, government-financed, affordable-housing complex that is nearly climate neutral, constructed with minimum pollution and maximum energy efficiency. The California Energy Commission subsidized the \$18.5 million Solara complex to help create a working example for developers in the public and private sectors on how to buildgreen and at low cost.</p>	
<p>Kyocera parking lot, Kearny Mesa: The 235 kW “solar grove” arrangement provides PV electricity to the adjacent manufacturing plant as well as shade and cover for autos in the parking lot. EnvisionSolar, a San Diego company, is now marketing solar PV systems for parking areas.</p>	

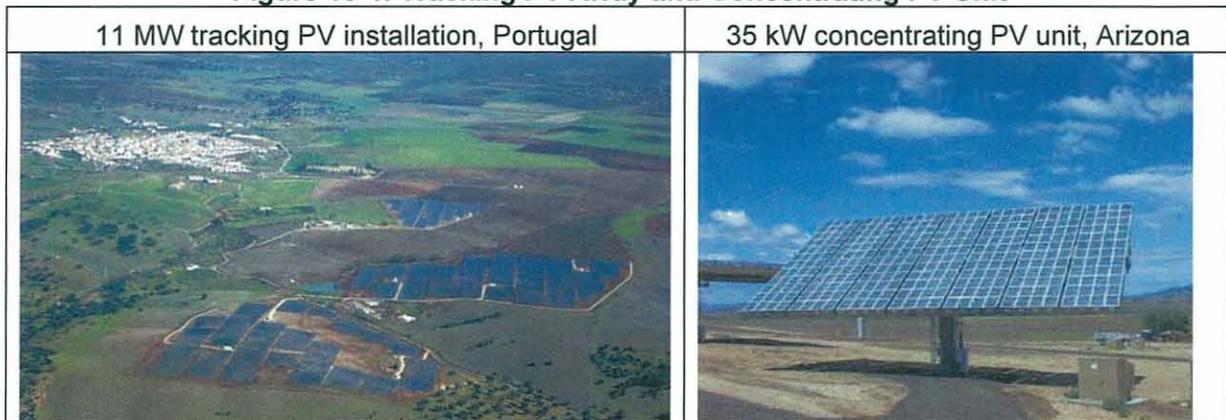

13. Concentrating Solar and Renewable Energy Parks

San Diego County is rich in solar resources. Use of concentrating solar technologies, as opposed to fixed rooftop PV, can maximize the amount of solar energy extracted from this solar resource. There are four types of concentrating solar technologies in operation or under development at this time: 1) solar trough, 2) concentrating PV, 3) dish Stirling, and 4) concentrating towers. Although not a concentrating solar technology, tracking PV has been deployed on a large scale and is fully commercial. “Tracking” means the panel or dish is slowly pivots to follow the path of the sun over the course of the day. A tracking PV system generates significantly more power than a fixed PV system as a result.

Solar trough is the only technology that can be considered fully commercial at this time, with 354 MW of capacity in operation in California. The minimum size considered commercially viable for this technology is approximately 50 MW. A 50 MW solar trough power plant would require approximately 300 acres of flat land. As a result, solar trough technology is not a good match for the terrain or land availability realities of San Diego County.

Dish Stirling and concentrating tower technologies are still at a pre-commercial stage.¹⁴² The San Diego Regional Renewable Energy Study Group addressed dish Stirling in its August 2005 report *Potential for Renewable Energy in the San Diego Region*.¹⁴³ Dish/Stirling is identified as pre-commercial in this study, based on analyses conducted by the National Renewable Energy Laboratory and Black & Veatch consulting engineering firm. In contrast, concentrating PV has performed well at the 1 MW pilot stage and appears ready for commercial scale-up to a 5 to 10 MW size.¹⁴⁴ PG&E has announced a contract for a 2 MW concentrating PV peaking power plant on 8 acres in Tracy, California.¹⁴⁵ Tracking PV systems are also commercial and have been built as large as 11 MW. Photos of an 11 MW tracking PV array in Portugal, and of a concentrating PV unit operating in Arizona, are provided in Figure 13-1. PG&E has also announced an agreement for 5 MW of PV on 40 acres near PG&E’s Mendota substation in Fresno County.¹⁴⁶

Figure 13-1. Tracking PV Array and Concentrating PV Unit

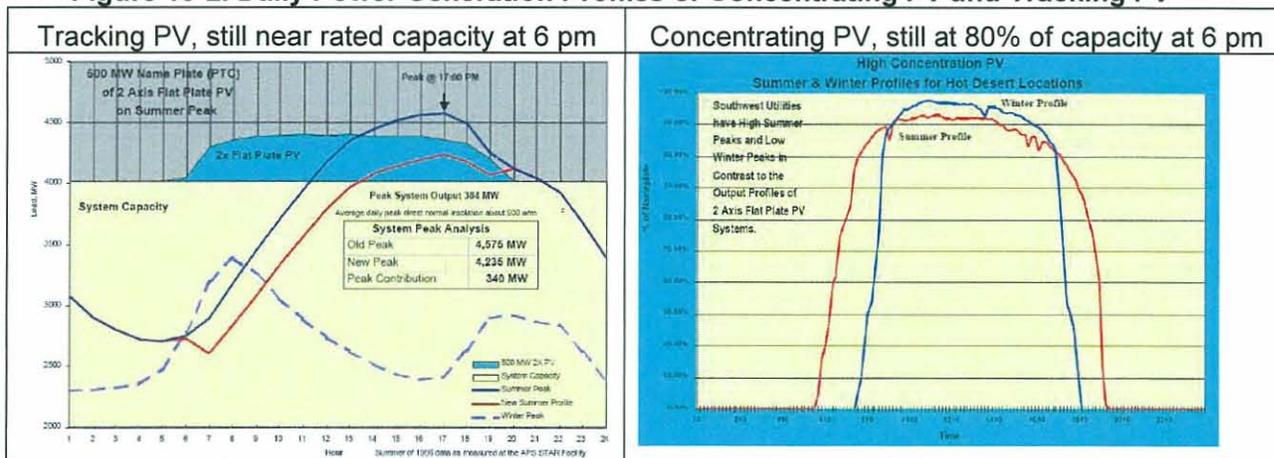

San Diego County has few areas that are amenable to the land requirements necessary for a commercial-scale solar trough power plant. To address this reality, the concept of “renewable

energy parks” has been developed to best match the topography and land use of more rural areas of San Diego County with appropriate solar options.¹⁴⁷ This concept entails the deployment of many smaller concentrating PV or tracking PV arrays in the 1 to 10 MW size on commercially-available land near existing SDG&E transmission lines and substations. SDG&E owns a network of 69 kV transmission lines that serve the rural areas of the county. Power from these renewable energy parks would be delivered over the 69 kV grid to developed areas of the county.

A credible and inclusive stakeholder process will be necessary to establish ground rules for identifying acceptable renewable energy park parcels. Many of the residents and landowners in the backcountry of San Diego County are there because it is rural and relatively undeveloped and would prefer that it remain that way. These are the people that will be most directly impacted by the renewable energy parks. However, many of these same residents are aware of the need to move quickly to address climate change and greatly increase renewable energy production. The inclusive stakeholder process used to develop the *RES 2030* is an example of the type of stakeholder process that could be used to cooperatively identify the most suitable sites for renewable energy parks. Without such a stakeholder process, the development of renewable energy parks in the backcountry will almost certainly experience delays and unnecessary controversy.

The power generation profile of concentrating PV and tracking PV closely match the daily power demand profile. See Figure 13-2. As a result, both of these technologies are good candidates to serve as peaking power supplies on hot summer days. The CEC recently compared the lifecycle cost of a host of power generation technologies and determined the lifecycle cost of power generation from concentrating PV is considerably lower than the cost of generation from a peaking gas turbine.¹⁴⁸ This further reinforces the advisability of the development of a renewable energy park using concentrating PV or tracking PV to demonstrate that such installations can serve as reliable peaking units on the hottest summer days (when the sun is always shining).

Figure 13-2. Daily Power Generation Profiles of Concentrating PV and Tracking PV

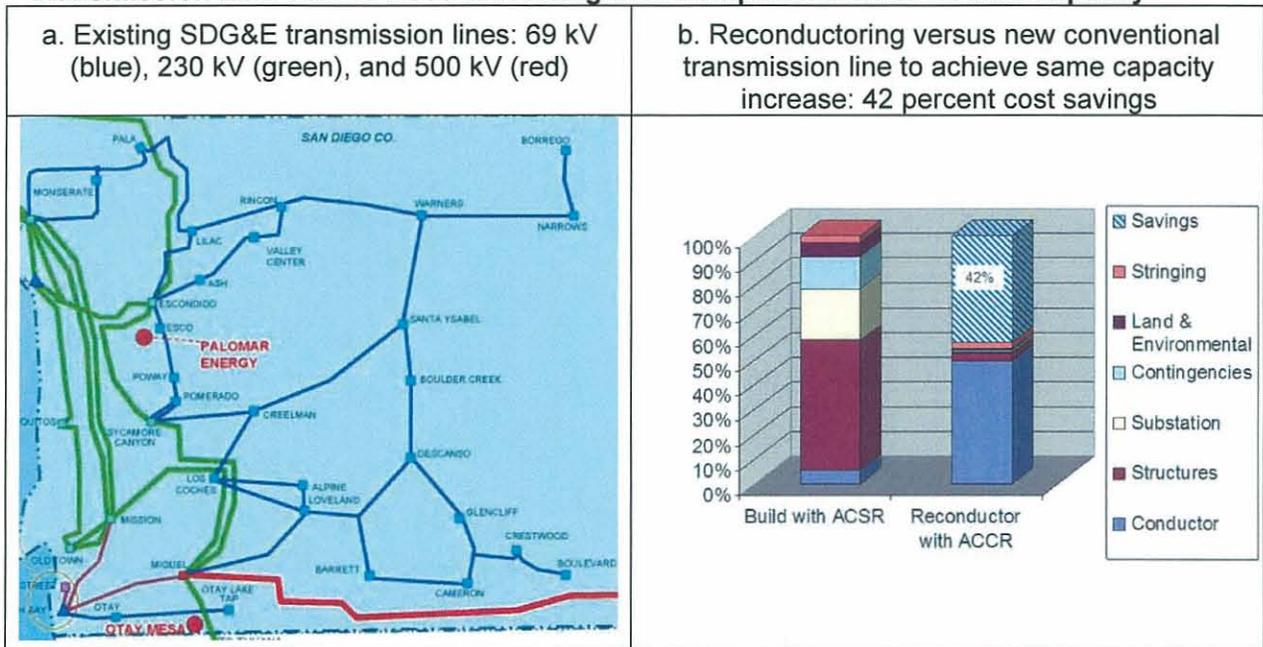

The existing 69 kV system should be capable of handling hundreds of MW of power generation from individual 1 to 10 MW solar installations in rural areas of the county. Should these renewable parks develop rapidly; the capacity of the 69 kV system can be approximately doubled by reconductoring the existing lines with commercially available high temperature, low sag

conductor technology. The location of these 69 kV lines is shown in Figure 13-3a. The capacity of the 69 kV system in East County, which consists of four separate existing 69 kV lines, could be increased to the range of up to 1,000 MW total via reconductoring and transformer substation upgrades.¹⁴⁹ Increasing the voltage of the 69 kV grid would also be a consideration if growth of the renewable parks began to approach the capacity of an upgraded 69 kV system. Reconductoring with high temperature, low sag conductors is also an option for transmission lines with voltages up to 230 kV.

One type of high temperature, low sag conductor is manufactured by 3M Company. SDG&E has a test section of the 3M high temperature, low sag conductor on a section of a 69 kV line.¹⁵⁰ According to data provided by 3M, it is significantly less expensive to replace the wire on an existing 69 kV line with this type of high temperature, low sag conductor than to build a new 69 kV line. The relative cost of reconductoring an existing 69 kV line compared to a new 69 kV line is shown in Figure 13-3b.

Figure 13-3. Existing SDG&E 69 kV Grid and Relative Cost of a New Stand-Alone Transmission Line Versus Reconductoring with Composite Line to Double Capacity^{151,152}

ACSR: aluminum conductor steel reinforced (conventional); ACCR: aluminum conductor composite reinforced

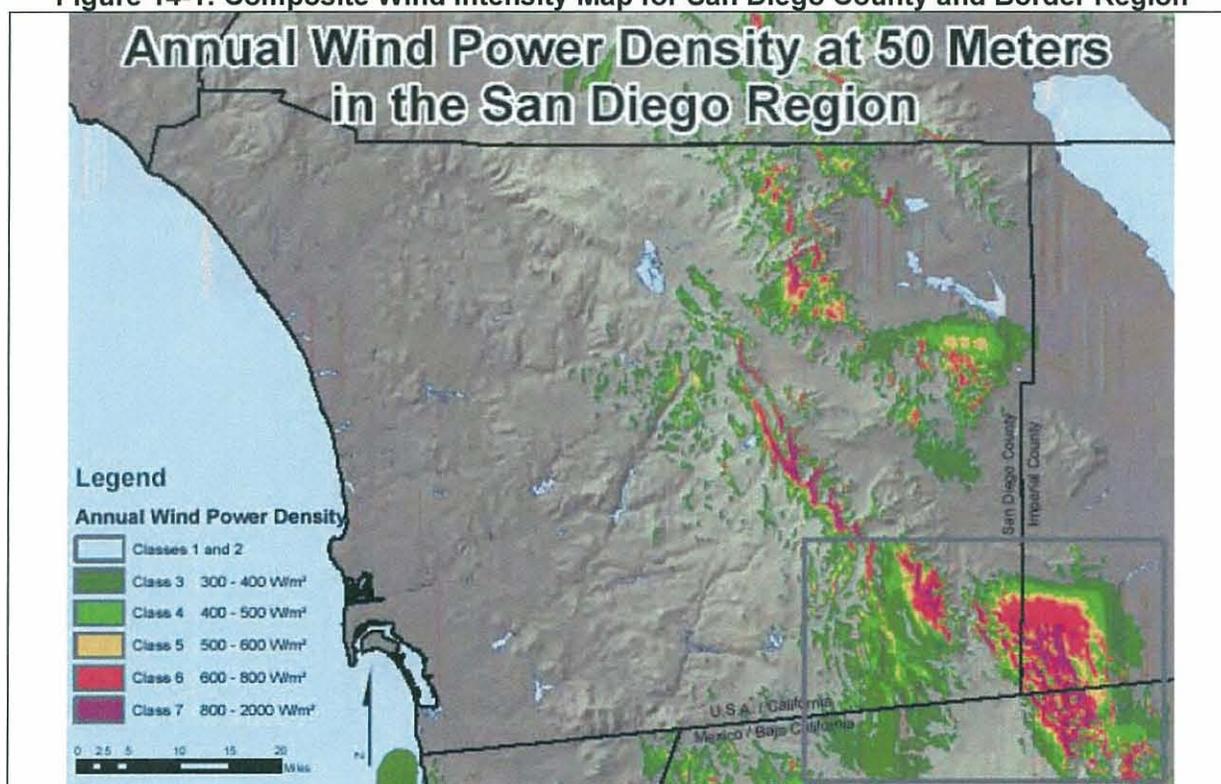

14. Utilizing the Wind Resource – What Are the Tradeoffs?

The regional wind resource is excellent, with a combined potential of 1,650 to 1,830 MW in eastern San Diego County and across the border in Baja California.¹⁵³ The high wind resource locations are shown in Figure 14-1. SDG&E has a power purchase agreement with a 50 MW wind farm located 60 miles east of San Diego. Fenosa, a Spanish firm, recently announced plans to develop a 500 MW wind farm just across the border in an area of Baja California called La Rumorosa. The power will be exported to California. Sempra Energy has announced the

company has purchased co-development rights for 250 MW of wind power in La Rumorosa as well, and that this power will be imported along SDG&E's existing 500 kV Southwest Powerlink (Southwest Powerlink is the red line along the border in Figure 13-3a).¹⁵⁴

Wind power is a fully commercial technology and is cost-effective, in the range of \$0.05 to \$0.07/kWh.¹⁵⁵ However, the regional wind resource is strongest is at night and in non-summer months when electricity demand is relatively low. The wind resource tends to be weakest on summer days, when demand is highest. The high value wind resource sites also tend to be located in areas of spectacular natural beauty that are among the last large regional undisturbed habitats of a number of threatened and endangered species. This means that locating large wind farms in San Diego County will be controversial unless there is a credible preliminary process, similar to the process described above for renewable energy parks, which identifies selected areas that are suitable and other areas that should be off-limits to wind projects.

Figure 14-1: Composite Wind Intensity Map for San Diego County and Border Region

Wind power is considerably less capital intensive than PV on a MW basis. The inclusion of a significant amount of wind power to reach the 50 percent GHG reduction target by 2020 would result in lower cost to reach the goal than a strategy based exclusively on PV. In addition to the 500 MW Fenosa project just over the border, wind developers have requested transmission access for over 800 MW of wind projects in eastern San Diego County. This is a total of approximately 1,300 MW of wind capacity. If half this wind capacity gets built to serve the San Diego area, approximately 600 MW, this new wind energy will provide about 10 percent of the San Diego region's energy needs in 2020 and about 20 percent of the targeted GHG reduction.

This quantity of wind power would equal the annual energy output of approximately 1,000 MW of PV capacity.¹⁵⁶

However, no peak power demand contribution can be assigned to the regional wind resource. As noted, the wind trends to be strongest in evening hours and non-summer months. Effective energy storage would be necessary for wind power to reliably contribute to meeting peak power demand. Practical solutions to this challenge are: 1) pumped storage between reservoirs of different elevations in the county, 2) utility-scale battery storage with sodium-sulfur batteries, or 3) the advent of large numbers of plug-in hybrid vehicles that would allow wind energy feeding into the grid at night to charge vehicles. These vehicles would be plugged into the grid during the day when the owner is at work and would be available to feed back into the grid to meet rising demand during the day. These energy storage options are discussed in more detail in Section 15.

15. Energy Storage – Maximizing Renewable Energy Benefits

Energy storage systems allow intermittent renewable energy to be stored and used during periods of peak demand and highest electricity rates. Energy storage also allows work to be done during periods of low demand and low electricity prices. Examples include the production of chilled water or ice for air conditioning systems in the evening for use during the peak demand period the following day, to reduce peak energy demand and avoid paying peak electricity prices. These systems are briefly described in the following paragraphs.

15.1 Battery storage for fixed rooftop PV

The electricity production from fixed rooftop PV systems typically declines by 3 pm. Yet the peak demand generally occurs in the 3 pm to 6 pm period. Therefore, only a portion of the PV system's capacity is available during the period of greatest demand. However, by adding a modest amount of battery storage to the system, 2 to 3 hours, the PV system can consistently supply power at or near its rated capacity during the afternoon peak. SCE is currently conducting a demonstration test of rooftop PV systems equipped with Gaia Power Tower energy management/battery storage systems operating as peaking power systems.¹⁵⁷ Adequate battery storage makes PV a much more valuable contributor to meeting peak demand than a fixed system with no battery storage.

Battery storage systems built with PV systems are eligible for the same tax credits as the PV systems.¹⁵⁸ These battery systems represent dependable power that can be dispatched by the utility during periods of peak demand and recharged at night when demand and prices are low. Adding limited battery storage to PV systems is today's off-the-shelf equivalent to what the plug-in hybrid automobile may be one day in the future. SDG&E is currently proposing a critical peak rate of \$1.20/kWh. Battery storage will rapidly pay back in a dynamic pricing environment where battery power receives a critical peak price premium.

15.2 Large-scale utility battery storage

The Japanese are investing heavily in high-temperature, sodium-sulfur batteries for utility load-leveling applications. Approximately 150 MW of utility peak-shaving batteries are in service in Japan. American Electric Power, whose subsidiaries include electric utilities in the Indiana, Ohio, West Virginia area, is planning to install 35 MW of peak shaving sodium-sulfur batteries by 2017. Large-scale battery storage options are discussed in detail in **Attachment L**.

15.3 Thermal energy storage for air conditioning systems

Air conditioning systems that include thermal energy storage dramatically reduce the peak electrical demand of these systems. As noted above, thermal energy storage, in the form of cold water or ice, also allows work to be done during periods of low demand. This reduces peak energy demand and minimizes peak electricity prices paid by the owner. **Attachment H** includes a pair of thermal energy storage diagrams that explain how chilled water and ice thermal energy storage systems work.

15.4 Pumped hydroelectric storage for wind power

San Diego has one major pumped storage project, the Lake Olivenhain-Lake Hodges 40 MW pumped storage project. Lake Olivehain is located at a significantly higher elevation than Lake Hodges. Water will be pumped from Lake Hodges to Lake Olivenhain during periods of low electricity demand, generally at nighttime, and sent from Lake Olivenhain to Lake Hodges by gravity to drive a hydroelectric turbine during periods of high electricity demand. A description of this project is provided in **Attachment M**.

15.5 Plug-in hybrid cars as peaking power plants

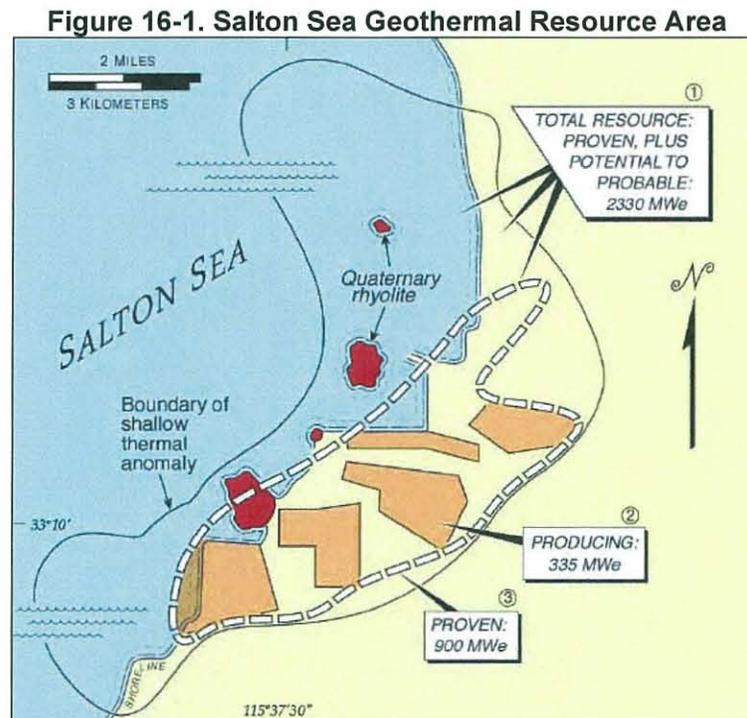

Plug-in hybrids could also fill the role of peaking power plants during periods of high demand. Battery-powered cars would serve as storage for energy generated in the evening, a period of relatively low demand and low electricity prices, and would discharge the power at peak demand times from a two-way electrical connection in the parking garage.

Google and PG&E will test six Toyota Prius and Ford Escape hybrid vehicles modified to run partly on electricity from the power grid.¹⁵⁹ One vehicle has been modified to send electricity back to PG&E. This test takes the hybrid a step further by using extra batteries to hold spare energy. PG&E will send wireless signals to the car while it is parked and plugged-in to determine its state of charge. PG&E can then recharge the batteries or draw out power. If there were thousands of such vehicles connected to the grid, the utility could store power produced in slack hours until it was needed at peak times.

The South Coast Air Quality Management District, which covers the entire greater Los Angeles-Long Beach-Riverside areas, is recommending the deployment of 100,000 plug-in hybrids by 2014 and up to 1,000,000 by 2020 in its 2007 Air Quality Management Plan.¹⁶⁰

16. Geothermal Power – Is It Sustainable?

The geothermal resource in Imperial County is also significant, with a near-term potential of 800 MW.¹⁶¹ Approximately 400 MW of geothermal power is already in production in Imperial County. The primary geothermal resource is located at the south end of the Salton Sea. See Figure 16-1. A major advantage of geothermal power is that it is available 24 hours a day, 7 days a week, in contrast to intermittent solar and wind resources. The cost of power production is also relatively low, in the range of \$0.05 to \$0.07/kwh.¹⁶² However, the geothermal fluid in Imperial County is very high in solid content, approximately 20 percent, and these solids contain a high concentration of metals. The principal geothermal developer in Imperial County, CalEnergy, briefly experimented with refining zinc from the geothermal solids several years ago. Low zinc commodity prices made the zinc refining operation unprofitable and it was discontinued.

Geothermal plants in the Imperial Valley are also large consumers of water. This water is primarily consumed in the evaporative cooling towers that are used to condense the geothermal steam after it passes through the power turbine. Much of the water used in the cooling tower is condensed geothermal reservoir fluid. This is geothermal fluid that does not get recycled back into the geothermal reservoir to maintain reservoir pressure. A concern with this approach is that as more and more geothermal plants are built in Imperial County, the pressure in the geothermal reservoir(s) may go into permanent decline and a potentially sustainable resource may become unsustainable.

This issue can be addressed by using a combination wet-dry cooling system that would reduce cooling tower water consumption by 80 to 90 percent. However, geothermal plants are very

expensive to build. These plants will not be built to minimize the consumption of geothermal fluid in the cooling towers without state regulations that require minimum water use in geothermal plant cooling systems. It is unclear whether geothermal power development in Imperial County can be considered sustainable given the unknowns surrounding the impact of increasing consumptive use of geothermal fluid for evaporative cooling as more geothermal plants are built.

17. Rapid Expansion of Combined Heat and Power

Distributed generation systems are any power generators that generate power at the point of use. These systems can be renewable energy, such as rooftop PV, or highly efficient natural gas-fired “combined heat and power - CHP” systems. CHP have the lowest GHG footprint of any fossil fuel power generation system (639 lb CO₂ per MWh, compared to 819 lb CO₂ per MWh for combined cycle power plants and 1,170 lb CO₂ per MWh for peaking gas turbine power plants).¹⁶³

Another benefit of CHP and other forms of distributed generation when compared to bulk transmission or central station power plant additions is reducing the consequences of single-point failures related to the outage of large transmission lines and power plants. Reducing exposure to system failures increases the overall security of local energy supply.

CHP facilities typically produce in the range of 1 to 20 MW of electric power. The hot exhaust gases from the combustion process, a small gas turbine or stationary reciprocating engine, are used to make steam or hot water for onsite use. The steam can be used for both heating and cooling. For example, steam can be used to drive a highly efficient centrifugal chiller to provide cooling in summer. That same steam can be used as a source of heat in winter, or by onsite processes that require steam.

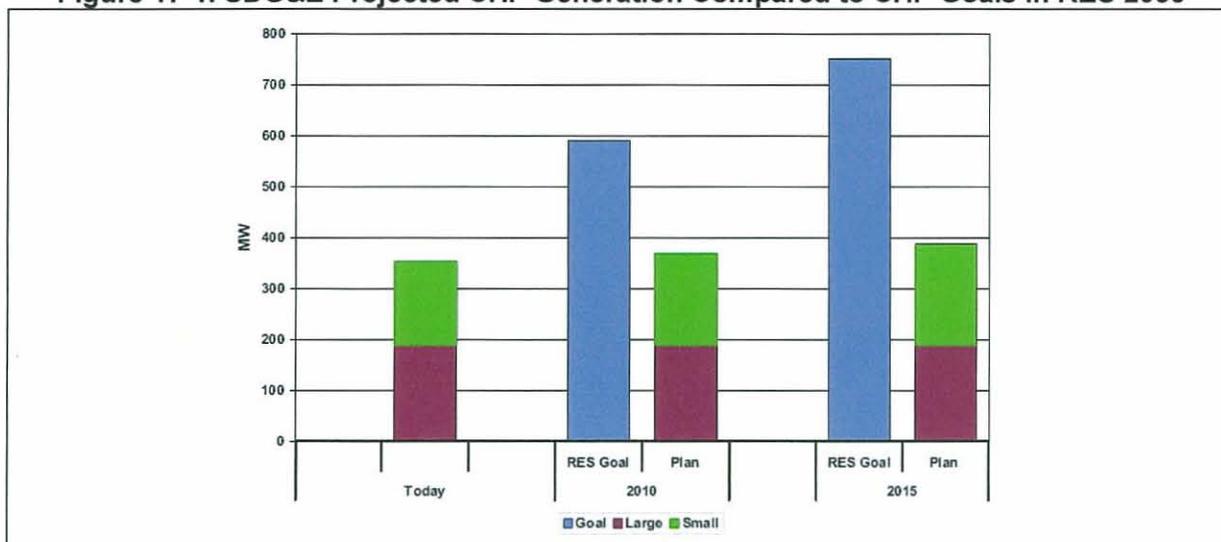

Rapid expansion of CHP power generation is a priority goal in the *Energy Action Plan*. *Energy Action Plan II* states (p. 9): “Develop tariffs and remove barriers to encourage the development of environmentally-sound combined heat and power resources and distributed generation projects.” The *Energy Action Plan* prioritizes CHP over large central power plants.

RES 2030 calls for 1,100 MW of CHP by 2020. There are currently less than 400 MW of CHP capacity in the San Diego region. Achieving the *RES 2030* target of 1,100 MW CHP capacity by 2020 means 700 MW of CHP must be added in the region. This is the equivalent of a “virtual” South Bay Power Plant replacement in terms of MW capacity, and would negate the need to construct another baseload power plant in the region.

The CEC “road map” for CHP development calls for CHP to provide 25 percent of peak load by 2020. SDG&E is projecting a peak load in 2016 of 5,060 MW. Twenty-five percent of 5,060 MW is 1,265 MW. Yet SDG&E projects almost no increase in CHP capacity over the next decade.¹⁶⁴ SDG&E estimates total large and small CHP at approximately 390 MW in 2015 as shown in Figure 17-1 (SDG&E projections are the green and purple bars labeled “Plan”).¹⁶⁵ This

is in contrast to the *RES 2030* goals of 590 MW of CHP by 2010 and 1,100 MW of CHP by 2020.

Figure 17-1. SDG&E Projected CHP Generation Compared to CHP Goals in RES 2030

The CEC indicates that significant energy policy changes will be necessary to accelerate the development of CHP in California. The March 2007 *Distributed Generation and Cogeneration Policy Roadmap for California* report prepared by CEC staff calls for ten more years of subsidies for distributed generation technologies.¹⁶⁶ These include incentive payments for CHP under the CEC’s self-generation program. Making such policy changes, according to the report, could turn distributed generation from a nascent technology that makes 2.5 percent of peak power to a significant provider that meets 25 percent of the state’s peak power needs by 2020.

Among the changes envisioned by the CEC to generate a quarter of the state’s power from off-grid distributed generation are transparent dynamic rates for electricity. The report also recommends removing institutional barriers. For instance, distributed generation has been hampered by a lack of uniform rules and standards that could speed installation of equipment.

There are approximately 240 candidate sites for conventional combined heat and power facilities in San Diego County.¹⁶⁷ These include large private employers, large city and county government centers, military bases, large hospitals, large hotel complexes, large shopping complexes, and large universities and colleges. Some of these sites already operate CHP plants, such as the University of California San Diego, San Diego State University, Children’s Hospital, and Qualcomm.

A number of relatively large cogeneration (power and steam) plants are also located on military bases in the San Diego area and sell power to SDG&E. These plants are known as “qualifying facilities” and date from the 1980s. These plants “qualified” for a financially attractive electric rate, known as the Standard Offer 4 (SO-4) contract, which was developed in California to promote the construction of high efficiency cogeneration plants and renewable energy resources. The utilities were required to purchase all power generated by these facilities under the terms of the SO-4 contract.¹⁶⁸

Utility tariffs more favorable to distributed generation are needed according to the March 2007 CEC policy roadmap. A favorable rate structure that accurately reflects the benefits of CHP is essential to expand the development of CHP in the San Diego area. SDG&E's proposed critical peak pricing tariff of \$1.20/kWh is an example of a tariff that would greatly improve the economics of CHP.¹⁶⁹ This rate would apply for up to 126 hours per year. A CHP plant selling 2,000 kW to SDG&E for 126 hours at \$1.20/kWh would receive \$302,400 in revenue in return. The cost of fuel to provide this power would be in the range of \$15,000 to \$20,000.¹⁷⁰

Applying a favorable tariff, like the PG&E A-6 tariff, to CHP in the San Diego region would also dramatically improve the financial attractiveness of CHP. The summer peak A-6 tariff is \$0.319/kWh (see Table 10-2). The summer peak in SDG&E service territory is May 1 through September 30, from 11 am to 6 pm, a total of 1,071 hours per year. The total revenue from generating 2,000 kW at the A-6 rate for 1,071 hours is \$683,000. The fuel cost to produce this power would be in the range of \$150,000, leaving over \$500,000 in net revenue. The revenue generated from power sales at the peak rate alone would nearly cover the financing of the CHP plant.¹⁷¹

SDG&E must also take all the excess power generated by CHP facilities to maximize the benefit of these plants to the region and to ensure the plants are operating at maximum efficiency. As noted, SDG&E recently established a precedent for taking excess power from CHP facilities when the company signed a contract in October 2006 to take excess power from the Children's Hospital CHP plant.

The SDG&E prohibition on CHP plants supplying power to adjacent buildings under different ownership creates an artificial barrier to CHP development in San Diego County as well. Similar facilities that individually are too small to support a dedicated conventional CHP plant, such as medium-sized hotels or commercial office buildings, are often clustered together. CHP would be significantly more cost-effective and fuel efficient if these "clusters" could be served by the same conventional CHP plant. This impediment must be addressed if the goal of adding 700 MW of CHP by 2020 is to be realized.

Smaller scale CHP options are now also available. The Sheraton Hotel and Marina on Harbor Island has a long-term agreement with Alliance Power for 1.5 MW stationary fuel cell power plant that supplies 70 percent of the hotel's electric power demand. The waste heat from the units is used to heat swimming pools and for domestic water heating. The plant consists of two fuel cells, a 1 MW unit and a second 0.5 MW unit. The 1 MW unit went online in December 2005, the 0.5 MW unit in mid-2006. A description of this project is provided in **Attachment N**.

Microturbines combined with absorption chillers are another example. United Technologies markets microturbine-absorption chiller packages under the trade name "PureComfort®." Systems are offered at 240 kW, 300 kW, and 360 kW. The hot exhaust gas is utilized in an absorption chiller/heater. The efficiency of this system can reach 90 percent. PureComfort® systems are installed at the Reagan Library in Simi Valley, California and the Ritz-Carlton Hotel in San Francisco.¹⁷² The availability of such small CHP packages greatly expands the potential number of candidate CHP facilities in San Diego County.

18. Natural Gas-Fired Gas Turbine Generation – Where Does It Fit?

Natural gas-fired combined-cycle and peaking gas turbine capacity will be necessary to provide power at night and during periods of cloudy or inclement weather in 2020. These conventional generation assets will also be needed to provide reliability support as experience is gained in San Diego with greater and greater levels of intermittent renewable energy power. There will not be a need for new utility-scale base load generation, beyond the 542 MW Palomar Energy and 561 MW Otay Mesa combined-cycle projects, if the deployment of CHP and PV systems meet the capacity targets in *San Diego Smart Energy 2020*.

The CEC has determined that California’s combined-cycle population operates with an average capacity factor between 53 and 61 percent on average.¹⁷³ SDG&E’s two combined-cycle plants will be needed to provide power in the evenings in 2020. It is possible that the capacity factor of these two plants in 2020, as a result of operating in this “load following” pattern,¹⁷⁴ will be comparable to the average capacity factor of California combined-cycle plants today.

By 2020 the San Diego region will be exporting considerable amounts of power during the day when the PV systems and CHP plants are operating at or near capacity. The average daytime load is likely to fluctuate between 2,000 and 2,500 MW in 2020 under *San Diego Smart Energy 2020*, yet the combined capacity of the PV systems and CHP will be approximately 3,400 MW.¹⁷⁵ This means daytime power generation in the San Diego area from PV and CHP will exceed demand. This power will be exported to neighboring utility districts during these times on the existing transmission system. At night only the CHP plants will be operating, and output from these plants will 1,000 MW or less. Yet the average nighttime load is likely to be in the range of 1,500 to 2,000 MW. This will require that combined-cycle plants make up the difference.

The net effect of this diurnal cycling between PV and combined-cycle in 2020 will be that slightly more combined-cycle power is used in the San Diego region, approximately 500 GWh per year, than PV power is exported to neighboring utility territories.

19. Getting Maximum Benefit from the Existing Transmission Grid

19.1 Start from the Bottom Up: Modernize the Distribution Grid

The electricity distribution system is the relatively low voltage system, 12 kV and less, that directly serves neighborhoods and commercial areas. SDG&E’S electricity distribution system includes 264 distribution substations, 977 distribution circuits, 231,112 poles, 9,351 miles of underground system, 6,712 miles of overhead systems, and various other pieces of distribution equipment. SDG&E has an aging infrastructure problem across broad categories of transmission and distribution equipment.¹⁷⁶

The single largest quantity of SDG&E transformers was installed in the 1950's. Many of these transformers are either approaching obsolescence or are obsolete due to excessive maintenance requirements, operational limitations, lack of spare parts, and deteriorating condition. Aging infrastructure affects not only substation transformer banks but also wood poles and underground cable. Approximately 30 percent of SDG&E's wood poles have been in service for at least 50 years, and approximately 48 percent have been in service for 40 years. Polymeric cables remain a large contributor to SDG&E's aging infrastructure problem, in particular cables installed prior to 1983. The pre-1983 vintage cables were manufactured with poorer manufacturing processes and much less quality controls and typically did not have a jacket. SDG&E continues to invest significant capital and resources to maintain these groups of cables.¹⁷⁷

Aging SDG&E distribution infrastructure continues to demand more and more maintenance and repair resources. As the age of equipment increases the amount of maintenance necessary also increases. So does the probability of failure in-service. Aging equipment becomes obsolete due to wear, technology advancements, and lack of availability of replacement parts. A large amount of SDG&E'S distribution equipment is reaching the end of its useful life.

SDG&E has correctly identified that the weakness in the transmission system is at the distribution level, the interface with homes and businesses. The immediate need is a complete overhaul of the 12 kV distribution system. This is the appropriate time to invest in a revitalization of the SDG&E distribution system using "smart grid" technological innovations.

The smart grid concept was developed by the U.S. Department of Energy's Modern Grid Initiative. To address aging transmission and distribution infrastructure, the Modern Grid Initiative seeks to create a modern – or "smart" – grid that uses advanced sensing, communication, and control technologies to generate and distribute electricity more effectively, economically and securely. Smart grid integrates new innovative tools and technologies from generation, transmission and distribution to consumer appliances and equipment.

San Diego-based SAIC evaluated the benefits of implementing a smart grid in the San Diego area in 2006.¹⁷⁸ The benefits identified by SAIC include:

- Reduction in congestion cost.
- Reduced blackout probability.
- Reduction in forced outages/interruptions.
- Reduction in restoration time and reduced operations and maintenance.
- Reduction in peak demand.
- Other benefits due to self diagnosing and self healing.
- Increased integration of distributed generation resources and higher capacity utilization.
- Increased security and tolerance to attacks/natural disasters.
- Power quality, reliability, and system availability and capacity improvement due to improved power flow.
- Job creation and increased gross regional product.
- Increased capital investment efficiency due to tighter design limits and optimized use of grid assets.

- Tax savings for the utility from a depreciation increase.
- Environmental benefits gained by increased asset utilization.

If all thirteen smart grid improvement initiatives identified by SAIC for the San Diego region are implemented, the initiatives would generate \$1.4 billion in utility system benefits and nearly \$1.4 billion in customer benefits over 20 years.

19.2 Existing 230 kV and 500 kV Corridors: Low Cost Upgrades Buy Big Benefits

SDG&E has two major existing transmission import corridors. Each of these corridors can be upgraded economically to provide more reliability support to the SDG&E transmission system.

Five 230 kV lines, collectively known as “Path 44,” provide north-south transmission from the San Onofre Nuclear Generating Station substation, on the property of Camp Pendleton Marine Corps Base, into the San Diego urban area. The emergency transmission capacity of Path 44 is 2,500 MW. Emergency capacity in this case means the capacity when the largest import transmission line into the San Diego area, the 500 kV Southwest Powerlink (SWPL) with a rated capacity of 1,900 MW, is temporarily out-of-service.

Path 44 rating plays a key role in determining SDG&E power reliability needs. The Utility Consumer’s Action Network (UCAN) has proposed that SDG&E take the actions necessary to upgrade Path 44 to allow emergency import limit for Path 44 from 2,500 MW to 2,850 MW. This upgrade would reduce SDG&E’s local power reliability needs by 350 MW. UCAN estimates \$111 million would be necessary to upgrade the Path 44 import capability by 350 MW.¹⁷⁹

SDG&E’s east-west SWPL transmission line is rated at 1,900 MW, but is currently limited to 1,450 to 1,750 MW due to transformer emergency overload concerns at the Miguel substation. The Miguel substation is the western terminus of SWPL. It is located several miles to the southeast of San Diego. There are two 230 kV/500 kV transformers at the Miguel substation. SDG&E’s concern is that the outage of one 230 kV/500 kV transformer at Miguel would cause the adjacent transformer to exceed its emergency rating. One simple method to avoid this risk is to plan in advance that, if imports are above the current import limit, which varies hourly between 1,450 MW and 1,750 MW, and one transformer fails, then the other transformer will automatically be shut down as well.

SDG&E forecasts that there will be 400 to 1,400 hours per year in the 2010 to 2020 period when power imports along SWPL to Miguel will be constrained if SPL is not built. Modifying Miguel substation transformer operations in response could save millions of dollars almost immediately. This would more than cover the implementation cost of a more complex transformer operating procedure. The cost of increasing the import limit across the Miguel transformers to 1,900 MW is essentially zero using this approach. UCAN also estimates that the incremental cost to increase Miguel outlet capacity to 2,100 MW would be between \$4 and \$35 million. This is a situation

where significant incremental transmission benefits can be obtained for a low incremental cost.¹⁸⁰

20. Staying On Track: Loading Order and Distributed Generation Policy Initiatives

The SANDAG Energy Working Group is actively promoting legislation that would: 1) direct the CPUC to refine its current utility ratebasing policies to better reflect and support the *Energy Action Plan* loading order, and 2) direct the CEC to continue incentives for CHP installations.¹⁸¹ The September 20, 2007 decision in the CPUC energy efficiency proceeding has initiated the process of bringing utility financial incentives into alignment with the loading order.¹⁸² Two bills currently moving through the Legislature, AB 1064 (Lieber), the Self Generator Incentive Program extension legislation and AB 1613 (Blakeslee), Waste Heat and Carbon Emissions Reduction Act, could impact the rate of CHP development in California if they are passed into law.

The concept of the loading order is not unique to California. This same approach, prioritizing a package of energy efficiency, demand response, and distributed renewable and CHP generation measures, is currently being advocated in Maryland by a coalition of clean energy developers, including Solar Turbines, as a cost-effective alternative to a proposed \$1.8 billion transmission line. The proposed transmission line would import coal power to meet a projected demand growth of 1,800 MW. The Maryland case is addressed in this section.

20.1 Aligning Utility Incentives with Energy Action Plan

The Energy Working Group has recommended the passage of legislation directing the CPUC to open a new proceeding to review and refine its existing utility infrastructure ratebasing policies to better align its policies with the loading order in *Energy Action Plan II*. The loading order described in *Energy Action Plan II* is shown in Figure 20-1. The new legislation would direct the PUC to develop appropriate new utility shareholder penalties and revenue opportunities for failing, meeting, or exceeding *Energy Action Plan II* loading order goals and targets.

Figure 20-1. Aligning Utility Financial Incentives with Loading Order

CA Resource Loading Order	Proposed Change
Energy Efficiency	Highest ROI
Demand Response	↑ Sliding Scale ↓
Renewables	
Distributed Generation	
Fossil-Fuel Power Plants and Related New Transmission	Lowest ROI

Current CPUC ratebasing policies provide utility shareholder incentives for the bottom of the loading order, utility-scale power plants and new transmission, but offers no shareholder revenue earning opportunities for energy efficiency, demand response, renewables, and distributed generation at the top of the loading order. This runs counter to state energy priorities and needs to be revisited by the CPUC.

The September 20, 2007 CPUC decision in the energy efficiency proceeding (R.06-04-010) has restored energy efficiency program performance-based shareholder penalties and rewards that were dropped by the CPUC in 2002. However, this proceeding is not considering any changes in current ratebasing policies, and would not address the other priorities listed in the loading order. The CPUC has not reviewed or refined its current utility ratebasing policies since 2003, the year the original *Energy Action Plan* was adopted.

The legislature and the CPUC must reorient the existing utility incentives if energy efficiency, renewable energy, and distributed generation are to be prioritized over the traditional utility steel-in-the-ground approach. The financial motivators need to be realigned so that utilities profit by supporting the *Energy Action Plan* loading order, and are penalized if they do not.

20.2 Extend Incentive Program for Clean Distributed Generation

In most parts of the U.S. and the world, CHP is recognized as an efficient and environmentally advantageous technology. Clean natural gas CHP:

- Achieves combined electric and thermal efficiencies from 60 to 90 percent.
- Avoids and or defers the need to build costly electric transmission and distribution infrastructure.
- Eliminates or reduces transmission and distribution losses, reduces or eliminates grid congestion.
- Significantly decreases GHG emissions relative to any other type of natural gas combustion.

Incentives for CHP are important to accelerate projects, to offset the many institutional and utility obstacles that are still present, and to help support industry investment in low emission technology. A 2005 CEC assessment of CHP concluded that continuation of the Self Generator Incentive Program would increase CHP by more than 40 percent over the next 15-year period with natural gas engines and turbines accounting for an overwhelming share of the new capacity additions.

The current Self Generator Incentive Program expires on December 31, 2007. The proposed legislation would direct the CPUC in consultation with the CEC to administer a Self Generation Incentive Program for ultra-clean and low-emission fossil-fuel CHP technologies, and waste gas fueled generation, that would commence on January 1, 2008, and continue to January 1, 2012.

However AB 1064 (Lieber), the Self Generator Incentive Program extension legislation in the Assembly, no longer includes a continuation of incentives for CHP. The CHP component was deleted in committee.¹⁸³ Starting January 1, 2008, only fuel cell and wind technology will be eligible for incentives in statute. Unless the incentives for CHP are reincorporated in AB 1064, this legislation will not assist in accelerating the construction of CHP capacity in San Diego County.

AB 1613 (Blakeslee), Waste Heat and Carbon Emissions Reduction Act, would encourage the construction of CHP in California if it is passed into law. This legislation would establish that the conversion of waste heat to electricity or other useful energy application is an efficiency measure for purposes of the loading order. The objective of the legislation is to add 5,000 MW of new CHP by 2015 in California.¹⁸⁴ This bill is awaiting Governor Schwarzenegger's signature as of October 10, 2007.

20.3 Distributed Generation as Alternative to New Transmission – Maryland Case Study

The Maryland Public Service Commission is currently evaluating a proposed 290-mile transmission line that would import power from West Virginia to Maryland. A major justification for the line is a concern over transmission congestion as electricity demand increases over time. Maryland recently signed into law legislation to add 1,500 MW of solar energy over the next 15 years. A coalition of clean energy developers is advocating that the Commission undertake a thorough study of specific renewable energy, clean CHP, and demand management “smart grid” measures as an alternative to the proposed transmission line.¹⁸⁵

The clean energy coalition asserts in its August 17, 2007 letter to the chairman of the Maryland Public Service Commission that:¹⁸⁶

We believe that this accelerated, continuous development (of peak-coincident solar energy, high efficiency distributed generation, and “smart grid” technologies) could be achieved at a ratepayer cost less than the proposed \$1.8 billion with significantly reduced delivery and financial risk as compared to a single massive transmission corridor. Further, these resources would bring low-emissions generation capability into Maryland. The choice is between expending ratepayer funding on low-risk, low-emissions distributed generation, or relying on a single, controversial, high risk project that will only enable the export of our energy dollars to produce air pollution upwind.

The Maryland clean energy industry coalition letter is provided in **Attachment O**.

21. Accommodating Growth – New Construction Must Account for Its Own Energy Needs

New construction in San Diego must “carry its own weight” in terms of electric energy demand. This can be achieved by requiring that new construction meet most or all of its projected electric energy demand through use of rooftop PV. This does not mean that new construction will necessarily be burdened with additional costs. For example, the PV program described in this report would result in lower electricity costs than purchasing electricity from SDG&E.

Numerous home builders in the Central Valley are incorporating rooftop PV into all new home construction as a standard feature.¹⁸⁷ This should be a standard feature for new home construction in San Diego County as well. The energy demand of new and renovated buildings should also be minimized by requiring that cost-effective green building design principles be utilized. The affect of incorporating green building principles is dramatic. California’s Attorney General Jerry Brown has specifically recommended that San Diego take these actions to more effectively address climate change.¹⁸⁸

In its ongoing energy efficiency proceeding, the CPUC has issued a September 17, 2007 draft decision with three initiatives described as “essential”: 1) all new residential construction in California will be zero net energy by 2020, 2) all new commercial construction in California will be zero net energy by 2030, and 3) the heating, ventilation, and air conditioning industry must be reshaped for maximum efficiency. The stated motivation for moving to zero net energy demand in new structures is the revolutionary impact of global warming on the global economy.¹⁸⁹

22. Conclusions

1. Climate change is a critical problem and arguably the greatest single issue of our time. The *California Global Warming Solutions Act* of 2006, AB 32, mandates a 25 percent reduction in greenhouse gases by 2020 and an 80 percent reduction by 2050. Reaching these mandates will require a more rapid transition to renewable energy sources for power generation than is currently contemplated.
2. Domestic natural gas currently used in the San Diego region will be displaced by imported liquefied natural gas in 2009. Liquefied natural gas carries an additional 25 percent “lifecycle” greenhouse gas burden relative to domestic natural gas. This displacement will nullify the greenhouse gas reductions projected by SDG&E over the next decade. Accelerated deployment of energy efficiency measures and renewable energy technology would mean considerably less dependence on volatile natural gas prices and liquefied natural gas imports.
3. The San Diego region is projected to have approximately 4,600 MW of PV potential on commercial, buildings, parking structures, and parking lots in 2010, as well as 2,800 MW

of technical potential on residential structures. The 2010 technical potential for PV is in the range of 7,400 MW. A major advantage of commercial and residential PV is the relative lack of siting controversies. Also, PV equipped with adequate (2- to 3-hour) battery storage would be a dependable energy resource during peak demand periods. 2,040 MW of PV capacity, equipped with sufficient battery support to reliably provide power at or near capacity during the 3 to 6 pm peak on hot summer days, would meet more than half of the San Diego area's peak power needs under most conditions in 2020.

4. A \$1.5 billion PV incentive program would be sufficient to incentivize the construction of 2,040 MW of distributed PV in the San Diego area by 2020. The incentive program would be similar to the structure of SB1 and the California Solar Initiative, where an incentive pool of \$3.35 billion is expected to add 3,000 MW of PV in California by 2017. A goal of SB1 and CSI is to reduce the cost of PV to the point where PV is cost-competitive with conventional natural gas-fired generation without incentives by 2016.
5. The expansion of rooftop commercial and residential PV systems and combined heat and power projects is currently limited by: 1) the inability to sell excess power to SDG&E, and 2) the relatively low commercial electricity rates during peak demand periods that do not reflect the real value of the electricity.
6. The *Energy Action Plan* calls for a 20 percent reduction in energy consumption to be achieved in government and commercial buildings by 2015 compared to a 2003 baseline. The San Diego region's annual energy consumption over the last few years has been approximately 20,000 GWh. Setting a real 20 percent reduction in regional energy demand compared to the 2003 baseline year as the regional energy efficiency target would mean an absolute decline in energy demand of approximately 4,000 GWh, leaving a net total energy demand in 2020 of 16,000 GWh.
7. SDG&E peak demand in 2007 was 4,636 MW. Approximately 1,500 MW of this peak load was associated with residential and commercial building cooling systems. Yet little effort or money is currently being invested in reducing the demand of these cooling systems through utility energy efficiency incentive programs.
8. SDG&E will complete the installation of smart meters at all customer locations by 2011. SDG&E projects that these smart meters will reduce peak demand by 5 percent. Smart meters with thermostat control capability were demonstrated to reduce peak load by over 40 percent during a three-year California test. The advent of smart meters also offers the potential to sequentially cycle a portion of the cooling systems drawing power from the grid. The duration of the cycling would be brief enough to avoid discomfort, yet would keep hundreds of MW of cooling system load off the power grid during periods of very high demand.
9. Central air conditioning units are the predominant residential cooling system. State-of-the-art central air conditioning units use as little as one-half the power of the "average" central air conditioning unit in the San Diego area. There is a similar gap in the energy efficiency of the typical commercial building cooling system in the San Diego area and

its potential performance with a cost-effective upgrade to variable speed motors and associated controls.

10. Lighting is an area where energy efficiency measures can have a dramatic impact. Compact fluorescent bulbs reduce energy demand by 75 percent relative to a standard incandescent bulb. Currently 10 to 20 percent of bulbs are compact fluorescent bulbs. New light emitting diode lighting technologies can also significantly reduce lighting related demand even further.
11. Refrigeration has been a modest energy efficiency success story. The average energy efficiency of refrigerators in the San Diego area improved by 22 percent between 2000 and 2005. Federal “energy star” efficiency standards for refrigerators have been a factor. Consumer interest in energy efficiency has also been a factor in refrigerator purchasing decisions, supported by limited rebates offered by SDG&E.
12. Upgrading existing buildings to current Title 24 structural weatherization standards or beyond is cost-effective. The *Energy Action Plan* calls for all existing state buildings to be upgraded to meet rigorous “LEED” green building standards by 2015, and establishes the same goal for commercial buildings. SDG&E currently offers free home weatherization and energy efficient appliance replacement services to low-income customers via its “direct assistance” program. Expanding this program to include all cost-effective energy efficiency upgrades regardless of consumer income level is necessary to fully realize regional energy efficiency opportunities.
13. Rapid expansion of combined heat and power is a priority goal in the *Energy Action Plan* and *RES 2030*. The *Energy Action Plan* prioritizes combined heat and power over large central power plants. There is currently less than 400 MW of combined heat and power capacity in the San Diego area. 700 MW of combined heat and power must be added to meet the *RES 2030* target of 1,100 MW of combined heat and power capacity by 2020.
14. There will not be a need for additional utility-scale base load generation, beyond the 542 MW Palomar Energy and 561 MW Otay Mesa combined-cycle projects, if the deployment of combined heat and power meets *San Diego Smart Energy 2020* targets. If *San Diego Smart Energy 2020* milestones and targets are met, there will be no need to add additional peaking gas turbine capacity.

23. Recommendations

23.1 Greenhouse Gas Reduction

1. San Diego should reduce its greenhouse gas emissions from power generation at the maximum rate that is cost-effectively achievable. Implement a strategic energy program targeting a 50 percent reduction in greenhouse gas emissions by 2020. This target will put San Diego on par with California's two largest cities, San Francisco and Los Angeles, which have committed to 51 percent renewable energy by 2017 and 35 percent renewable energy by 2020, respectively. The 50 percent reduction in greenhouse gases will be achieved at a cost that maintains electricity rates at or below current utility rates.
2. Decouple SDG&E profit from traditional power plant and transmission line ratebase revenue streams. Couple profit to achieving: a) greenhouse gas reduction benchmarks, and b) *Energy Action Plan* loading order.

23.2 Energy Efficiency

1. Achieve an absolute 20 percent reduction in energy consumption relative to a 2003 baseline, from 20,000 GWh to 16,000 GWh.
2. Greatly expand the number and pace of energy efficiency retrofits of all non-Title 24 residential buildings and all commercial buildings in the San Diego area. Retrofits in warm and hot areas of SDG&E service territory are first priority, including Borrego Springs, El Cajon, La Mesa, Lemon Grove, Santee, Lakeside, Ramona, Poway, and Escondido.
3. The Center for Sustainable Energy, or an equivalent third party entity, should conduct the energy efficiency audit program. Expand staff as necessary to audit 10 percent of non-Title 24 residential buildings and 10 percent of commercial buildings without LEED certification per year during the 2008 through 2017 period.
4. Weatherize 10 percent of non-Title 24 residential buildings to the Title 24 standard and 10 percent of commercial buildings without LEED certification to the LEED-EB standard per year in the San Diego area beginning in 2008. Include all residential and commercial structures with a weatherization energy savings payback of ten years or less in the program. Weatherization cost should be borne by the utility or the CCA (whichever structure is in place).

23.3 Peak Demand Reduction

1. Achieve an absolute 25 percent reduction in peak demand relative to a 2006 baseline, from 4,636 MW to 3,500 MW. Twenty percent of this demand reduction would result from energy efficiency upgrades. Five percent of this demand reduction would result from use of smart meter technology and real-time dynamic pricing.
2. Maximize the demand response potential of smart meters combined with automatic thermostat controls to the degree technically feasible.
3. Establish a minimum target of 85 MW per year absolute reduction in peak demand, for a total of 1,100 MW peak demand reduction by 2020, with an emphasis on cost-effective central air conditioner and central plant upgrades. Combine cooling system upgrades, lighting retrofits, and weatherization projects to the degree possible to achieve maximum demand reduction.

24.4 Renewable Energy

1. Establish \$1.5 billion capital incentive budget to add 2,040 MW of PV by 2020. Equip the PV systems with adequate battery storage to allow operation as peaking power units during summertime peak demand periods. Prioritize installation of commercial and residential PV over other forms of renewable energy for the following reasons: acceptable cost-effectiveness, minimal environmental impact, lowest potential to generate siting controversies, and production of energy when it is most needed.
2. SDG&E should establish a distributed generation rate structure that accurately reflects the peak demand benefits of renewable and combined heat and power distributed generation. The rate structure should be modeled on PG&E's A-6 tariff. This tariff has resulted in a high number of applications for commercial PV installations in PG&E service territory.
3. SDG&E should expand the policy of accepting all excess electricity generated from renewable energy and combined heat and power distributed generation provider. SDG&E established the precedent for this policy with the October 2006 contract signed with Children's Hospital of San Diego to accept excess electricity from Children's 3.5 MW combined heat and power plant.
4. Construct one 5 MW concentrating PV renewable energy park in San Diego County by 2010 to demonstrate such a unit can reliability serve as peaking capacity on hottest days.
5. Consider incorporating lower-cost renewable energy, specifically East County wind power, if candidate sites can be identified with acceptably low environmental and social impacts.

23.5 Combined Heat and Power

1. Add 700 MW of combined heat and power capacity by 2020. CHP has the lowest GHG emissions of any natural gas-fired generation option. This objective is consistent with AB 1613 target of adding 5,000 MW of CHP in California by 2015. An additional 700 MW of combined heat and power capacity in San Diego County would displace the need for a new baseload power plant in the region (beyond the 561 MW Otay Mesa project that is currently under construction).

23.6 Transmission and Distribution

1. Renovate the SDG&E 12 kV distribution system. Utilize smart grid technological innovations to improve the performance of the distribution system, to reduce congestion costs and enhance the integration of PV and combined heat and power distributed generation sources.
2. Reinforce the existing north-south high voltage transmission corridor capacity (Path 44) to cost-effectively increase emergency import-export capacity from 2,500 MW to 2,850 MW. Increase the capacity of the east-west corridor (Southwest Powerlink) by upgrading transformers to increase rating from 1,900 MW to 2,100 MW of flow on a continuous basis.

23.7 New Construction

1. Require all new residential and commercial construction to be net zero energy demand. This means these structures incorporate state-of-the-art energy efficiency measures and are equipped with sufficient PV capacity to address the estimated annual energy demand of the structure.

24. Glossary

Term	Symbol	Definition
Advanced Metering Infrastructure	AMI	SDG&E \$572 million project to install electronic electric and natural gas meters at all customer locations by 2011.
Baseload	--	The minimum amount of power required at most/all times in the utility service territory. In SDG&E territory the baseload power requirement is in the range of 1,500 to 2,000 megawatts.
Baseload power plant	--	A power plant that operates on a continuous basis at or near its output capacity.
California Energy Commission	CEC	California Energy Commission
California Independent System Operator	CAISO	California Independent System Operator
California Public Utilities Commission	CPUC	California Public Utilities Commission
Combined heat and power	CHP	Small natural gas-fired power plants less than 20 MW capacity that use hot exhaust gas from the combustion process to make steam for use in heating or cooling systems.
Community Choice Aggregation	CCA	Legal option available to California cities and counties to become electric power purchasers and generators independent of an investor-owned utility.
Demand response	DR	Actions that reduce electric power consumption during periods of peak demand.
Distributed generation	DG	Electric power that is generated at the point of use. This can be renewable power, such as rooftop solar panels, or small natural gas-fired combined heat and power plants serving businesses, universities, hospitals, and government facilities.
Fossil fuel	--	Natural gas, oil, and coal.
Gigawatt	GW	One million kilowatts, or one thousand megawatts. One gigawatt equals the electricity demand of ten million 100-watt incandescent light bulbs.
Gigawatt-hour	GWh	An electricity demand of one million kilowatts for one hour or one thousand megawatts for one hour.
Greenhouse gases	GHG	Gases that trap heat in the atmosphere and lead to an increase in ambient temperature. Carbon dioxide (CO ₂), methane (CH ₄), and nitrous oxide (N ₂ O) are prominent greenhouse gases.
Kilowatt	kW	Unit of measure of electrical output. One kilowatt equals the electricity demand of ten 100 watt incandescent light bulbs.

Kilowatt-hour	kWh	One kilowatt of usage for one hour. This is the approximate average continuous electricity demand of a typical single family home.
Imperial Irrigation District	IID	Public utility that serves Imperial County.
Investor-owned utility	IOU	Investor-owned utilities are private power monopolies that are regulated by the California Public Utilities Commission. There are three investor-owned utilities in California: Pacific Gas & Electric, Southern California Edison, and San Diego Gas & Electric.
Lifecycle cost	--	Estimated levelized cost of a power generation technology over a 30-year period.
Long-Term Procurement Plan	LTPP	SDG&E's 2007-2016 strategic resource planning document submitted to the CPUC for approval in December 2006.
Los Angeles Department of Water & Power	LADWP	Public utility that serves the City of Los Angeles.
Megawatt	MW	One thousand kilowatts. One megawatt equals the electricity demand of ten thousand 100-watt light bulbs.
Pacific Gas & Electric	PG&E	Investor-owned utility that serves northern and central California.
Peak load		Peak load is the maximum electricity demand experienced during the year. Peak load occurs during hot summer afternoons when air conditioners are running at maximum rates.
Peaking power plant		A power plant that is used only during periods of peak electricity demand.
Photovoltaic	PV	Process of converting light energy into electric power.
Public utility	---	A non-profit electric utility that is a component of the public services provided by a municipal, county, or regional government.
San Diego Regional Energy Strategy 2030	RES 2030	Strategic regional energy plan adopted by SANDAG Board of Directors in July 2003.
San Diego Association of Governments	SANDAG	Regional planning agency representing all incorporated cities in San Diego as well as county government.
San Diego Gas & Electric	SDG&E	Investor-owned utility that serves San Diego County and the extreme southwestern tip of Orange County.
Southern California Edison	SCE	Investor-owned utility that serves part of central California and all of southern California with the exception of San Diego and Imperial Counties.
Sunrise Powerlink	SPL	SDG&E's proposed 500 kV, 1,000 MW transmission line.
The Utility Ratepayers Network	TURN	Utility consumer's non-profit advocacy group based in San Francisco.
Utility Consumer's Action Network	UCAN	Utility consumer non-profit advocacy group in San Diego.

- ²⁴ B. Powers telephone conversation with M. Johnson, Gaia Power Technologies, August 31, 2007. Suggested retail price for Gaia Power Tower for 11,000 watt PV system, with 50 kW-hr of storage, is \$15,000. This price includes the inverter, storage, charge controller, and ability to grid tie. Gross cost for 11,000 watt PV system without battery storage is approximately \$90,000 installed, including inverter (pro-rated from example in Table 8). The approximate retail equipment cost of inverters for this grid-tie only 11,000 watt PV system is \$9,000 (source: Xantrex customer

support, Sept. 4, 2007. Three Xantrex GT4.0 inverters required for 11,000 watt system, retail price \$3,130 per inverter). The net increase in gross system cost to adapt the PV system for peaking power service by substituting the grid-tie only inverter(s) with a Gaia Power Tower is less than 10 percent, from \$90,000 to \$96,000.

³⁶ California Energy Commission, *Natural Gas Market Assessment – Preliminary Results*, staff draft report, in support of CEC 2007 Integrated Energy Policy Report, CEC-200-2007-009-SD, May 2007, p. 3.

³⁷ CPUC Decision 04-09-022, *Rulemaking 04-01-025 to Establish Policies and Rules to Ensure Reliable, Long-Term Supplies of Natural Gas to California*, Phase I, Sept. 2, 2004. Findings of Fact (p. 89): 38. There is potential California customer access to LNG supplies through Otay Mesa, Ehrenberg/Blythe, Oxnard and Long Beach. 39. Designating Otay Mesa as a common receipt point for both the SoCalGas and SDG&E systems will send a signal to potential LNG suppliers that the gas they provide will have access to the utilities' systems.

³⁸ P. Jaramillo, Carnegie-Mellon University, *Comparative Life Cycle Air Emissions of Coal, Domestic Natural Gas, LNG, and SNG for Electricity Generation*, Environmental Science & Technology, published online July 25, 2007, and "Supporting Information" document. All CO₂ emission factors listed in this footnote are from the "Supporting Information" document. Assume the LNG is shipped from BP liquefaction plant in Tangguh, Indonesia, 7,500-mile tanker roundtrip to Sempra LNG regasification terminal in Baja California. The raw gas feeding the Tangguh liquefaction plant contains 10 percent CO₂ which will be vented to atmosphere at the plant (source: BP Indonesia webpage <http://www.bp.com/sectiongenericarticle.do?categoryId=9004748&contentId=7008786>). This is equivalent to a CO₂ emission rate of 12 lbs CO₂ per MMBtu, per the Carnegie-Mellon estimate of 120 lbs CO₂ per MMBtu of natural gas combusted. Assume average CO₂ generation from liquefaction (14 lb CO₂ per MMBtu without considering CO₂ content in raw gas). 7,500 miles is the same distance as Oman to the Everett, Massachusetts LNG terminal route cited in report, which generates 8 lb CO₂ per MMBtu in transport CO₂ emissions. Assume CO₂ generation from LNG regasification and storage is low due to use of seawater heating to regasify the LNG (1 lb CO₂ per MMBtu). Domestic natural gas emits a maximum of 140 lb CO₂ per MMBtu. Total additional CO₂ associated with LNG from Tangguh, Indonesia is 35 lb CO₂ per MMBtu. Incremental lifecycle CO₂ emissions associated with LNG imported from Tangguh are 35 lb CO₂ ÷ 140 lb CO₂ = 0.25, or a 25 percent increase in lifecycle CO₂ emissions.

³⁹ The California Energy Commission indicates that LNG from Sempra's Baja California import terminal will displace domestic natural gas from the Southwest (source: CEC Staff Draft Report, *Natural Gas Market Assessment Preliminary Results*, in support of the 2007 Integrated Energy Policy Report, CEC-200-2007-009-SD, May 2007, p. 2. Finding: "The amount of gas produced in the Southwest, which enters California at Blythe, gradually decreases during the forecast period as natural gas imported from Mexico (Costa Azul Facility) displaces domestic production from the Southwest."). Most domestic natural gas sources serving Southern California from the Southwest, specifically the Permian Basin of West Texas and the San Juan Basin of New Mexico, have low inherent raw gas CO₂ concentrations, on the order of 1 percent CO₂ or less. The sources of natural gas used in California are shown in Attachment C, Figure 4. A number of gas fields in the Permian Basin of West Texas have elevated CO₂ concentrations. However, this CO₂ is removed at the gas processing plant and used in CO₂ enhanced oil recovery

operations. This CO₂ is sequestered permanently in the oil formation when it displaces the oil or is recycled for further use in the enhanced oil recovery operation (source: e-mail from Mark Holtz, petroleum geologist, Bureau of Economic Geology, University of Texas – Austin, to Bill Powers, September 26, 2007).

⁷⁴ Jim Trauth, Envision Solar, estimate of solar parking lot potential in San Diego County, e-mail, June 13, 2007.

⁷⁵ The 25 percent estimate is expected to be quite conservative. A detailed statistical assessment would be necessary to accurately quantify the PV potential of the resource. Generally only small- or moderately-sized parking lots and parking structures that are immediately east of tall buildings would be excluded as candidates for PV installations. PV installations in parking lots immediately west of tall buildings could be oriented to maximize output during the afternoon summertime peak demand period. This would minimize or eliminate the shading effect of any building to the east.

¹³⁶ Press release, Gaia Power Technologies Partners with Southern California Edison to Increase Efficiency of Residential Solar Power Systems, March 27, 2007. www.gaiapowertechnologies.com/CEC_partnership.html

¹³⁷ The current gross installed cost of a residential PV system is approximately \$8 per watt (see Table 8). The approximate gross cost of an 11 kW system without battery storage is \$90,000. The cost of the inverter(s) for this system is approximately \$9,000. Gaia Power Technologies “manufacturer’s suggested retail price” for an 11 kW, 50 kWh energy management/battery system, which includes an inverter, is \$15,000. The addition of the energy management/battery system adds less than 10 percent to the gross cost of the PV system.

¹⁴⁹ As shown in Figure 8, there are four existing 69 kV corridors in the eastern section of San Diego County. According to SDG&E direct testimony by Richard Sheaffer on April 14, 2006 in CPUC proceeding A.06-04-018 that the 69 kV rating of SDG&E’s Escondido to Felicita 69 kV line will be increased to 137 MW using a standard steel reinforced conductor. “Acceleration of the reconductoring of the Escondido to Felicita 69 kV line. . . The project would increase the rating of the 69 kV line from 97.5 MVA to 137 MVA using a single 1033 kCMIL aluminum conductor steel reinforced (“ACSR”) conductor or equivalent.” 137 MVA is equivalent to 137 MW. Assuming the MW capacity of a aluminum conductor composite reinforced (“ACCR”) standard 69 kV line could be increased from 137 MW to at least 250 MW if it is reconducted with a high temperature, low sag line, the total capacity of the East County 69 kV grid would be increased to the range of 1,000 MW.

¹⁶⁸ California Cogeneration Council, *Pre-Workshop Opening Comments of California Cogeneration Council*, June 4, 2004, CPUC R. 04-04-025, Rulemaking to Promote Consistency in Methodology and Input Assumptions in Commission Applications of Short-run and Long-run Avoided Costs, Including Pricing for Qualifying Facilities. “The 1978 Public Utilities Regulatory Policies Act (PURPA) sought to reduce the country’s dependence on oil through the development of new resources for electric generation, including renewable resources (solar, wind, biomass, geothermal, and small hydro) and the more efficient use of oil and gas in cogeneration projects. PURPA’s key reforms included a requirement that the utilities must purchase the power output of qualifying cogeneration and other small power production facilities (referred to as “qualifying facilities” or “QFs”) – a key step designed to encourage the development of QFs by ensuring a buyer for QF power. PURPA also required the utilities to purchase QF power at the purchasing utility’s avoided cost—that is, at the cost that the utilities would have incurred themselves to produce or purchase the same energy and capacity. This avoided cost standard ensured that the utilities could not use their sole buyer power to depress the price paid to QFs. In California, this Commission found that the utilities had erected barriers to QF development, including to the development of cogeneration projects. In response, the Commission took the further step of developing “standard offer” power purchase contracts, available to any QF, that governed the terms of QF power sales to the utilities. The standard offer contracts greatly reduced the barriers to QF entry, by providing QFs with access to reasonable power purchase agreements that did not require extensive negotiations with the utility. The standard offer contracts included fixed capacity payments over

the term of the contract; these payments were based on the levelized cost of the utility's cheapest source of capacity at that time—a combustion turbine.⁸ Energy payments reflected the utility's operating costs that it avoided through its QF purchases (principally the costs of additional gas- or oil-fired thermal generation). Most of the state's cogeneration projects were developed and built between 1982 and 1990, under 20- to 30-year contracts which provided for the sale of excess electricity to the local utility. These long-term power purchase contracts enabled cogeneration plants to make firm commitments to supply power and steam to their host industrial and institutional facilities”.

¹⁶⁹ SDG&E, *SDG&E's Time-of-Use Electric Rate Structures & Net Energy Metering*, PowerPoint, February 2007, p. 17. The critical peak price would apply for up to 18 events from 11 am to 6 pm (7 hours each).

¹⁷⁰ Assume gas turbine has a heat rate of 10,000 Btu/kWh and cost of natural gas is \$7/MMBtu. Hourly fuel cost to produce 2,000 kW, assuming natural gas cost is \$7/MMBtu: 2,000 kW x 10,000 Btu/kW x (1 x 10⁻⁶ MMBtu/Btu) x \$7/MMBtu = \$140 per hour fuel cost. Total fuel cost for 126 hours: \$140/hr x 126 hours = \$17,640.

¹⁷¹ B. Powers telephone conversation with Chris Lyons, Solar Turbines. Approximate installed cost of 5,000 kW CHP plant is 1,500 per kW. If financed at 7% interest over 30 years, financing requirement is \$600,000 per year.

Attachments

Attachment A: Proposed Route of Sunrise Powerlink through Anza Borrego State Park

SDG&E's preferred route for the proposed 500 kV Sunrise Powerlink transmission line will pass through the center of Anza Borrego State Park. The proposed route will follow the pathway of an existing 40-foot high, 69 kV transmission line that has been in operation since the 1920s. Anza Borrego State Park is home to the largest population in the United States of the federally-listed endangered Peninsular Bighorn Sheep. The 500 kV transmission towers will be much larger than the existing 69 kV transmission poles in the park and will potentially change the character of the wilderness landscape.

Figure A1. The numbered transmission route in the center of the map below is the preferred route proposed by SDG&E. It will pass through the park on a route that takes it along the Vallecitos Mountain Wilderness, Pinyon Ridge Wilderness, and Grapevine Mountain Wilderness.
[\[http://www.cpuc.ca.gov/environment/info/aspen/sunrise/sunrise.htm\]](http://www.cpuc.ca.gov/environment/info/aspen/sunrise/sunrise.htm)

Figure A2. Anza-Borrego State Park is a World Heritage site and the largest state park in California. Two 40-foot high, 69 kV creosote pole transmission lines have been in operation in the area since the 1920s, predating the founding of the park in the 1930s.

Attachment B: Regional Sempra Energy Infrastructure and Projected Sunrise Powerlink Route to Los Angeles

Figure B1. This concept map showing the Sunrise Powerlink ultimately interconnecting with the Los Angeles area transmission grid was submitted by SDG&E in its March 6, 2006 letter to the U.S. DOE requesting "national interest electric transmission corridor" status for the transmission line.

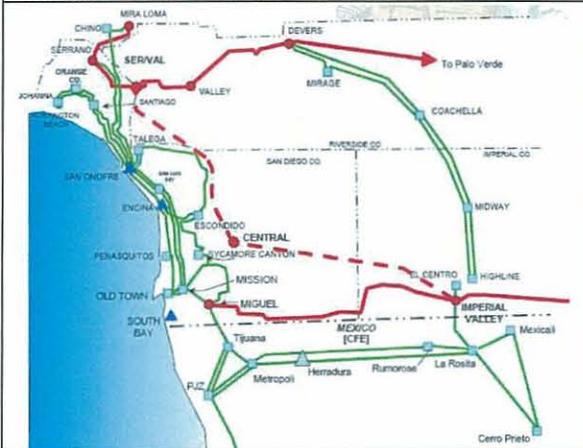

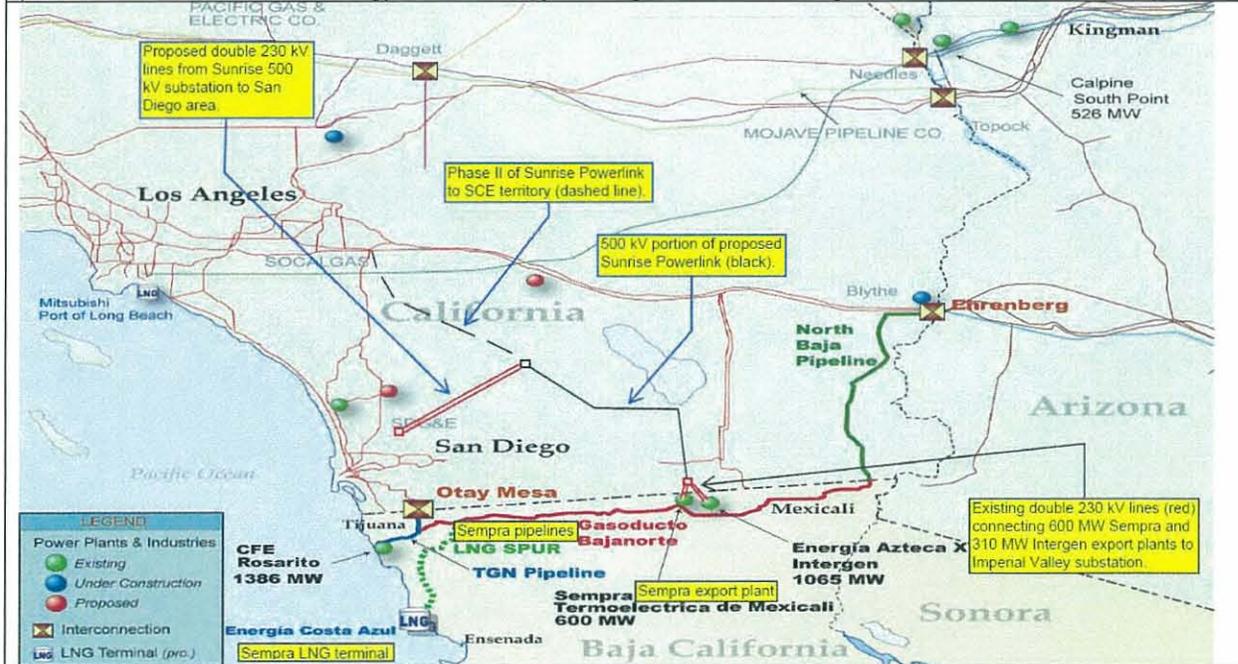

Figure B2. The transmission line will pass through the heart of Anza Borrego State Park. The 500 kV towers proposed by SDG&E will be considerably larger than the existing 69 kV transmission poles in the park. The park is home to the largest U.S. population of federally endangered peninsular bighorn sheep.

Figure B3. This map shows the interrelationship between the Sempra LNG terminal, Sempra natural gas pipelines, and the Sempra export power plant, all in Baja California, and the Sunrise Powerlink on the California side of the border. [source of base map: March 8, 2007 Sempra LNG presentation to the California Energy Commission; yellow tags and lines showing Sunrise Powerlink: B. Powers]

Attachment C: SDG&E Switch to LNG Will Negate Forecast GHG Reductions

SDG&E forecasts a 20 percent reduction in greenhouse gas (GHG) emissions between 2007 and 2016 in its Dec. 11, 2006 Long-Term Procurement Plan.¹ However, the SDG&E forecast does not account for reversal of flow on the SDG&E natural gas pipeline system in 2009 to move imported liquefied natural gas (LNG) from Sempra's LNG import terminal in Baja California to San Diego. Imported LNG carried a GHG burden that is approximately 25 percent greater than domestic natural gas.² The additional GHG burden is related to the high CO₂ content (10 percent) of the Indonesian raw gas that will be removed during gas processing³ and the energy necessary to: 1) cryogenically liquefy natural gas into LNG, 2) transport the LNG across the Pacific in a specially-designed tankers, and 3) regasify the LNG back to gaseous form at Sempra's receiving terminal in Baja California.

All of the power sold by SDG&E in 2016 that produces CO₂ emissions will be generated by power plants burning natural gas.⁴ See Figure 1. Approximately 50 percent of the natural gas sold by SDG&E is used in electric generation plants.⁵ The remaining 50 percent is used primarily by commercial and residential customers for space heating, water heating, and cooking and related uses. All of this consumption will convert to natural gas derived from imported LNG when flow is permanently reversed on the SDG&E pipeline system in 2009. SDG&E's parent company Sempra Energy will begin operation of its 1,000 million cubic feet per day (mmcf/d) Costa Azul LNG import terminal in 2008.⁶ Sempra has preliminary approval from the CPUC to reverse flow on the SDG&E natural gas pipeline system to move this LNG from the Costa Azul LNG terminal directly into the San Diego market.⁷ The CEC forecasts that this flow reversal will occur in 2009.^{8,9}

The lifecycle GHG emissions from natural gas fired power plants in SDG&E service territory, and those served by the Baja California natural gas pipeline system which is interconnected with the Costa Azul LNG terminal, will increase by approximately 25 percent in 2009. As noted, all GHG-emitting power generation sources identified in the 2016 SDG&E forecast are natural gas-fired. Therefore, all CO₂ emissions forecast for 2016 shown in Figure 2 are from natural gas-fired sources. The result of the additional GHG associated with the lifecycle GHG burden of imported LNG will be to increase the SDG&E basecase CO₂ emission estimates for power generation shown in Figure 2 by 25 percent from 2009 forward. See the adjusted CO₂ estimate (red line) in Figure 2. This will nullify the decline in GHG emissions from 2007 to 2016 currently projected by SDG&E.

Lifecycle GHG emissions associated with imported LNG will eliminate the GHG reduction benefits of reaching 20 percent renewable energy generation by 2010 as mandated by AB 107. AB 32 requires a return to the 1990 GHG emission level by 2020. This is an estimated GHG reduction of 25 percent by 2020. The post-2020 phase of AB 32 is even more ambitious, targeting an 80 percent reduction in GHG by 2050. It is unlikely that SDG&E can achieve the 2020 AB 32 target if there is no net lifecycle reduction in GHG emissions from natural gas-fired combustion sources in SDG&E service territory in the 2007-2016 timeframe.

Sempra proposes to import LNG from British Petroleum's Tangguh, Indonesia LNG liquefaction plant. Figure 3 shows a graphic of the route from the liquefaction plant to Sempra's LNG import terminal near Ensenada. Figure 3 also shows a breakdown of the 25 percent increase in lifecycle GHG emissions from each stage in the LNG process, from production of raw gas near Tangguh, processing and liquefaction of this gas, transport 7,500 miles to the LNG receiving terminal in Baja California, and regasification of the LNG for pipeline delivery to SDG&E service territory.

The current sources of natural gas supply to California are shown in Figure 4. The U.S. DOE domestic natural gas production forecast through 2025 is provided in Table 1. DOE is projecting a 14 percent increase in domestic natural gas production over the 2005-2025 period.

Figure 1. SDG&E Projection of Power Generation Sources to be Used to Meet Electricity Demand, 2007-2016¹⁰

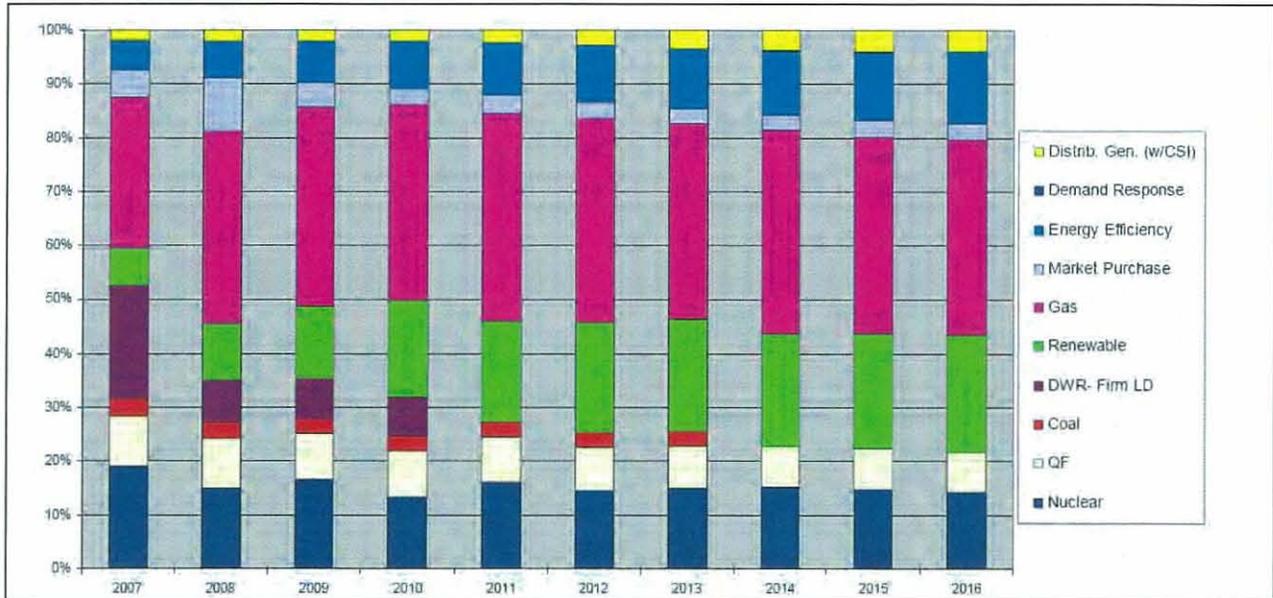

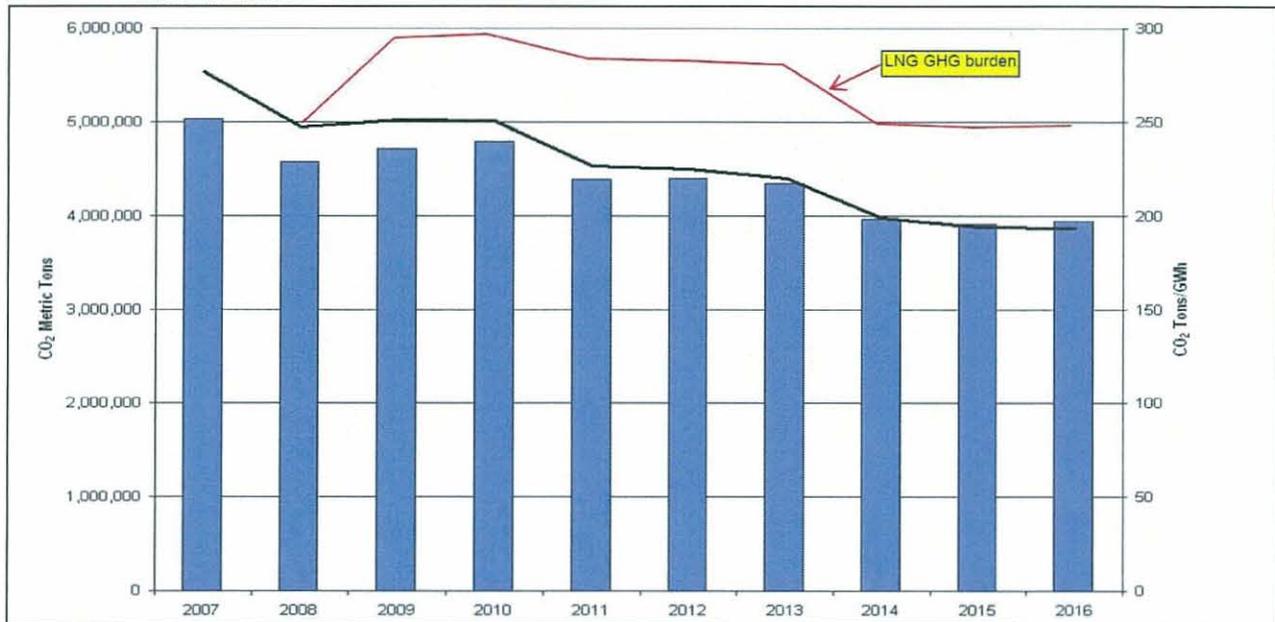

Figure 2. SDG&E Projection of Greenhouse Gas Emissions Trend, 2007-2016, and Powers Engineering Adjustment that Reflects the Lifecycle CO₂ Increase (from electric power generation only) Resulting from SDG&E Switch from Domestic Natural Gas to Imported LNG in 2009¹¹

Figure 4. Sources of California Natural Gas Supplies – 2006

Table 1. U.S. DOE Domestic Natural Gas Production Forecast, 2005 – 2025^a

Year	Domestic natural gas production ^b (trillion cubic feet)
2005	18.23
2010	19.35
2015	19.60
2020	20.79
2025	20.59

a) U.S. DOE Energy Information Administration, Annual Energy Outlook with Projections to 2030, Report DOE/EIA-0383, February 2007, p. 93. Tabular reference case natural gas production figures online at: http://www.eia.doe.gov/oiaf/aeo/pdf/aeotab_13.pdf

b) Reference case forecast is a 14% increase in U.S. domestic natural gas production from 2005 to 2020, from 18.23 trillion cubic feet per year to 20.79 trillion cubic feet per year.

¹ SDG&E 2007-2016 Long-Term Procurement Plan, December 11, 2006, p. 207.

² P. Jaramillo, Carnegie-Mellon University, *Comparative Life Cycle Air Emissions of Coal, Domestic Natural Gas, LNG, and SNG for Electricity Generation*, Environmental Science & Technology, published online July 25, 2007, and “Supporting Information” document. All CO₂ emission factors listed in this footnote are from the “Supporting Information” document. Assume the LNG is shipped from BP liquefaction plant in Tangguh, Indonesia, 7,500-mile tanker roundtrip to Sempra LNG regasification terminal in Baja California. The raw gas feeding the Tangguh liquefaction plant contains 10 percent CO₂ which will be vented to atmosphere at the plant (source: BP Indonesia webpage <http://www.bp.com/sectiongenericarticle.do?categoryId=9004748&contentId=7008786>). This is equivalent to a CO₂ emission rate of 12 lbs CO₂ per MMBtu, per the Carnegie-Mellon estimate of 120 lbs CO₂ per MMBtu of natural gas combusted. Assume average CO₂ generation from liquefaction (14 lb CO₂ per MMBtu without considering CO₂ content in raw gas). 7,500 miles is the same distance as Oman to the Everett, Massachusetts LNG terminal route cited in report, which generates 8 lb CO₂ per MMBtu in transport CO₂ emissions. Assume CO₂ generation from LNG regasification and storage is low due to use of seawater heating to regasify the LNG (1 lb CO₂ per MMBtu). Domestic natural gas emits a maximum of 140 lb CO₂ per MMBtu. Total additional CO₂ associated with LNG from Tangguh, Indonesia is 35 lb CO₂ per MMBtu. Incremental lifecycle CO₂ emissions associated with LNG imported from Tangguh are 35 lb CO₂ ÷ 140 lb CO₂ = 0.25, or a 25 percent increase in lifecycle CO₂ emissions.

³ BP Indonesia webpage (www.bp.com) - “Greenhouse gas emissions - The natural gas in the Tangguh fields contains approximately 10% CO₂ - relatively high by industry standards.” This CO₂ must be removed from the raw gas before the gas is liquefied. BP has made no commitment to sequester this CO₂ following removal during gas processing.

⁴ Natural gas fired sources included in the 2016 SDG&E plan are “natural gas”, “QF” – these are cogeneration plants firing natural gas, “market purchase”, and a portion of “distributed generation”. SDG&E identifies “market purchase” as having a CO₂ emission rate (915 lb CO₂ per MWh) similar to natural gas fired combined cycle generation (819 lb CO₂ per MWh). For this reason “market purchase is assumed to be natural gas-fired. All fossil fuel-fired cogeneration in SDG&E service territory is natural gas-fired.

⁵ 2006 California Natural Gas Report, SDG&E Tabular Data, pp. 98-100. In 2010, electric generation consumes 175 mmcf of 333 mmcf total natural gas demand. In 2015, electric generation consumes 175 mmcf of 348 mmcf total demand. All other non-electric power generation combustion sources will consume 173 mmcf in 2015.

⁶ Sempra LNG website, Energia Costa Azul – Project Overview. www.sempralng.com.

⁷ CPUC Decision 04-09-022, *Rulemaking 04-01-025 to Establish Policies and Rules to Ensure Reliable, Long-Term Supplies of Natural Gas to California*, Phase I, Sept. 2, 2004. Findings of Fact (p. 89): 38. There is potential California customer access to LNG supplies through Otay Mesa, Ehrenberg/Blythe, Oxnard and Long Beach. 39. Designating Otay Mesa as a common receipt point for both the SoCalGas and SDG&E systems will send a signal to potential LNG suppliers that the gas they provide will have access to the utilities’ systems.

⁸ California Energy Commission, *Natural Gas Market Assessment – Preliminary Results*, staff draft report, in support of CEC 2007 Integrated Energy Policy Report, CEC-200-2007-009-SD, May 2007, p. 23. “Major findings regarding natural gas supply are: Importation of LNG is expected from Mexico into San Diego through the Transportadora De Gas Natural De Baja California (TGN) pipeline beginning in 2009. Gas imported from Costa Azul is projected to grow from zero to more than 1,500 MMcf per day by 2017.”

⁹ J. Fore - CEC Natural Gas Unit, *2007 IEPR Natural Gas Forecast – Revised Reference Case*, PowerPoint presentation, August 16, 2007. Graphic on p. 26 shows natural gas from Costa Azul LNG terminal coming northward through Otay Mesa receipt point to San Diego at rate of 350 million cubic feet per day (mmcf) in beginning in mid-2009. This flowrate is greater than the average daily natural gas demand forecast by SDG&E for 2010 of 333 mmcf (see footnote 3). The revised August 16, 2007 LNG flow forecast shows LNG imports rising to 400 mmcf through Otay Mesa in 2016, significantly less than the initial June 2007 reference case forecasting 1,000 mmcf of LNG imports by 2016 (this case is also shown in the graphic on p. 26 of the PowerPoint).

¹⁰ SDG&E summary of 2007-2016 LTPP to SANDAG Energy Working Group, January 25, 2007.

¹¹ The lifecycle CO₂ increase associated with the switch to LNG imports in 2009 is shown for electric power generation only. However, all stationary combustion sources using natural gas in SDG&E service territory will be using natural gas originating at the Costa Azul LNG terminal from mid-2009 onward. As a result, these sources will also see a 25 percent increase in lifecycle CO₂ emissions. Non-electric power generation natural gas consumption in SDG&E service territory will average 173 mmcf in 2015. The CO₂ emission factor for natural gas consumption is 117 lb CO₂ per million Btu of natural gas combustion (source: SDG&E Dec. 11, 2006 Long-Term Procurement Plan, Vol. I, p. 207). The heating value of natural gas is approximately 1,000 Btu’s per cubic foot. Therefore, the forecast CO₂ emissions from non-electric power generation natural gas combustion in SDG&E service territory in 2015 is [173 mmcf × (1,000 × 10⁶ Btu/mmcf) × 117 lb CO₂/10⁶ Btu]/2,000 lb/ton = 10,120 tons per day, or 3,694,000 tons per year of CO₂. An increase of 25 percent in these non-electric power generation CO₂ emissions, representing the lifecycle CO₂ emissions increase resulting from the switch from domestic natural gas to LNG, is an increase of 920,000 tons per year of CO₂.

Mr. William Reed
Senior Vice President, Regulatory and Strategic Planning
San Diego Gas and Electric Company
8306 Century Park Court, Suite 41D
San Diego, CA 92123-1530

Dear Mr. Reed:

SUBJECT: SANDAG Recommendations on SDG&E's Long-Term Procurement Plan

MEMBER AGENCIES:

- City of Carlsbad
- Chula Vista
- Coronado
- San Mar
- El Cajon
- Encinitas
- Escondido
- Imperial Beach
- La Mesa
- Lennox Farms
- National City
- Oceanside
- Poway
- San Diego
- San Marcos
- Springer
- Volana Beach
- Vista
- and
- County of San Diego.

The San Diego Association of Governments Energy Working Group (SANDAG EWG), in cooperation with SDG&E, has had the opportunity to raise questions about and collaborate on future SDG&E energy resource planning and procurement policies. Following an extensive fact-finding project with stakeholders from businesses, environmental groups, and local governments, SANDAG has developed policy guidelines and recommendations for SDG&E to use in moving toward the goals of the San Diego Regional Energy Strategy 2030 (RES), which favors a balanced approach to energy policy issues. These recommendations are to offer guidance to SDG&E in its mandated Long-Term Procurement Plan (LTPP) submittal to the state.

The RES was written by a regional stakeholder group formed as a product of the Regional Energy Infrastructure Study (REIS), prepared in 2002. For over a year, these stakeholders held meetings and reached consensus on the goals for the San Diego region's energy policy. The RES's short-term quantitative assumptions were ultimately voted on and adopted by the SANDAG Board of Directors in 2003 as an energy planning tool for the region. The SANDAG Board also voiced its commitment to revisit the longer-term goals of the RES as needed.

ADVISORY MEMBERS:

- Imperial County
- California Department of Transportation
- Metropolitan Transit System

The SDG&E LTPP serves as a roadmap for how the utility plans to address San Diego's resource needs for the next 10 years. In SDG&E's LTPP filing, SANDAG looks for carefully thought out, long-term goals that satisfy a number of concerns, rather than offering quick fixes for the region's energy shortfalls. With respect to renewables and distributed generation procurement goals, SDG&E's goals should be aggressive in the short-term, building up to more aggressive goals in subsequent years.

The following are SANDAG's policy recommendations for SDG&E to consider and implement in its long-term planning, including its upcoming LTPP filing to the California Public Utilities Commission (CPUC).

- Focus on California's preferred loading order
- Evaluate technologies' costs and benefits
- Support renewable energy technologies
- Support distributed generation technologies
- Support in-region generation

Focus on California's Preferred Loading Order

One of the RES Guiding Principles states that, "Energy efficiency and demand management programs will be preferred over the development of new fossil fuel generation resources." In its procurement activities, SDG&E must follow the state-approved loading order, which gives highest priority to energy efficiency and demand response when planning for the state's energy future. These energy-saving measures are followed in priority order by renewable energy and distributed generation, conventional large-scale generation and transmission respectively.

The state's top priorities must also be SDG&E's. The LTPP submittal should clearly demonstrate how the utility is meeting or exceeding the state-mandated energy-saving targets for energy efficiency and demand response followed by renewables and distributed generation. Information imparted to the public should be as accurate, complete, and understandable as possible.

Evaluation of Technologies' Costs and Benefits

Other RES Guiding Principles emphasize an energy supply portfolio that is diversified, cost efficient, environmentally sound, self sustaining, secure, and reliable. A planned approach for procurement should involve developing metrics for evaluation of prospective conventional and renewable technologies. Scoring criteria for each technology should include, but not be confined to, the following:

- Cost-effectiveness to ratepayers-All technologies that are selected by SDG&E for their long-term plans need to ensure the costs incurred by ratepayers on a project do not increase their bills unduly or unreasonably, if at all.
- Cost-effectiveness to systems-Projects that are selected by SDG&E should not propose higher than reasonable costs to be expended to develop needed technologies.
- Role in global warming-Projects should advance the state toward baseline GHG emission standards, e.g. the Governor's Executive Order S-3-05, which states specific reduction goals for California and Assembly Bill 32, which passed the legislature in August 2006.
- Community economic impact-A broader set of guidelines reviewing costs related to pollution mitigation, health risks, aesthetic impacts, jobs, etc.
- Sensitivity to gas supply risk-When determining the cost of a project, SDG&E should take the cost and projected price volatility of natural gas into consideration as a component of the total cost for the project.

In project evaluation, SDG&E has noted that it already favors those projects that have the least environmental impact, that have the ability to meet specific reliability timelines, and that are the most cost-effective. SANDAG's goal is to recommend enhancements to this procurement procedure to ensure a more open and transparent process. The utility's request for proposals (RFP) should

provide prospective developers with the information they need to submit relevant projects to meet San Diego's resource needs. After completion of each bid process, SDG&E could alert all bidders as to why their proposals were accepted or rejected. This could continually improve the solicitation process and quality of bids.

Support for Renewable Energy Technologies

- The RES goal #3 states, "Increase the total electricity supply from renewable resources with an emphasis on in-region installations,"¹ and includes a target of 50 percent of those renewables from in-region. Therefore, it is imperative that SDG&E supports all economically and technically feasible renewable energy technologies. This is especially true for rooftop photovoltaic systems and central plant solar, wind, and geothermal systems as mentioned in the 2005 study: Potential for Renewable Energy in the San Diego Region.
- In order to achieve the state's Renewable Portfolio Standard (RPS) goals, SANDAG supports the establishment of in-region "renewable energy parks" and the streamlining of the permitting and transmission process for access to these parks. This measure could effectively intensify interest in renewables in the region. In addition to large-scale projects, this could promote research, development and demonstration (RD&D) projects by greatly expanding the amount of renewable technologies available to study within the San Diego region. RD&D could include next generation renewable technologies as well as studies on the maturity of existing technologies, like fuel cells and combined heat and power (CHP) systems utilizing renewable fuel. These measures will produce vital information for SDG&E and other decision-making bodies that shape energy policy, and will reflect an accurate picture of the energy sources available and their associated costs.
- In addition to this goal, locally placed renewables within and outside of renewable energy parks should be incentivized prior to providing incentives for out-of-region renewables. As part of any RFP bid evaluation, SDG&E should include significant weighting for renewable projects.
- Another issue gaining importance for renewable energy development is ownership of credits that contribute to the state's RPS goals. The CPUC is currently addressing this complex issue for the entire state. Once the CPUC establishes which resources can be counted toward the utilities' RPS goals with Renewable Energy Credits (RECs) and which cannot, SANDAG can revisit how this may or may not impact our regional renewable goals.

Support for Distributed Generation Technologies

RES goal #4 addresses the desire to increase the amount of distributed generation in the San Diego region. This is an area where there has not been significant progress toward the RES goal. SANDAG supports efforts to more aggressively reach the distributed generation target of 12 percent of peak demand by 2010, and recommends that SDG&E also take additional steps to reach this goal. Measures can include supporting the continuation of the Self Generation Incentive Program (SGIP), which provides incentives for distributed generation (DG) projects. (This program is currently scheduled to sunset December 31, 2007.)

Another measure can be an assessment of any barriers in the utility's rate and tariff structures available for end-users who are interested in taking advantage of distributed generation. For

¹ Energy 2030: The San Diego Regional Energy Strategy, May 2003, www.sdenergy.org

instance, the noncoincident peak demand tariff may be cost prohibitive for clean onsite DG use. Although these measures may not directly correlate to the long-term procurement plan filing, SANDAG would appreciate added attention to be given to enhancing the role of distributed generation in the San Diego region. SANDAG, through its Energy Planning program and the EWG, is poised to work with SDG&E and regional stakeholders in this area, both on technology development and on regulatory efforts.

Support In-Region Generation

With regard to renewable and nonrenewable electric generation in the region, SANDAG requests that all cost-effective and viable large-scale in-region generation projects be considered in SDG&E's procurement plans. RES goal #2 calls for achieving and maintaining capacity to generate 65 percent of summer peak demand with in-county generation by 2010.

Sunrise Transmission Project to be Addressed Separate from these Recommendations

RES goal #5 calls for an increase in the transmission system capacity as necessary to maintain required reliability and to promote better access to renewable resources and competitively priced supply. The transmission grid provides for a number of functions, including providing access to out of region power, improving fuel diversity (in particular, renewables), providing access to broader supplies in the market that can help lower and stabilize electric prices, and improving system stability and reliability. These benefits need to be balanced with the fact that siting issues for new transmission lines are often contentious and difficult to achieve due to the large number of parties that are affected by such projects (e.g. visual impacts, potential impacts on property values, concerns for the impacts of electric and magnetic fields). Subsequent to this letter, SANDAG will review the Sunrise Powerlink as it correlates to all aspects of the RES, including the impact on in-region renewable and nonrenewable generation.

We look forward to reviewing your draft submittal of the LTPP prior to your filing with the Public Utilities Commission. We also would like to thank you for the occasion to participate in the LTPP process as a planning partner, and look forward to an ongoing collaborative relationship in this realm.

Sincerely,

MICKEY CAFAGNA
Chair, SANDAG Board of Directors

1. Energy Parks to Balance Renewable Energy in San Diego Region

(R. Caputo, B. Butler, July 2007)

Current regional energy goal in San Diego is 40 percent renewable electricity by 2030, and having 50 percent come from within San Diego County. In-county land availability is fractured with sizes less than 200 acres at a site. To use this in-country resource, from 50 to 150 smaller solar plants would be required to match the power of one large desert plant. The concept of “energy parks” was suggested to overcome this barrier to in-county renewables and would allow multiple plant sites to be readied for construction and placed in a renewable energy land bank.

A new 64 MW parabolic trough plant by Solargenix is under construction in the Eldorado Valley Solar Energy Park created by Boulder City, Nevada. This is the first solar energy park created in the southwest. We have used this as a model for the Renewable Energy Parks proposed for San Diego County.

Concentrating photovoltaic systems (CPV) are making significant strides. A prototype 1 MW plant was built by Amonix for Arizona Public Service has been operating for several years, and a second 1 MW plant is being built by Sharp for Nevada Power. Concentrations of 400 to 1000 suns are used and cell efficiencies of 28 to 40 percent are achieved, with solar to AC electric efficiencies of 18 to 25 percent.

Flat plate photovoltaics (PV) are used on or near buildings. This is the only distributed solar technology considered and it holds great promise especially because of the recently enacted California Solar Initiative (CSI) program. The California Energy Commission goal for all of California is that 3,000 MW on-site PV be in place in 10 years. For the San Diego region, about 10 percent of this is expected. At the present time, about 30 MW of on-building PV exist in San Diego.

The more remote eastern half of San Diego County is the suggested region for the smaller concentrating solar plants that would not require transmission lines to bring the power to the urban center. First of all, what are the characteristics of the available land?

The best match between the smaller (<200 acres) parcels of rolling land in the rural eastern part of San Diego County and the four CSP technologies, is the dish-Stirling and the CPV systems. If 10 percent of the total available land is used as the technical potential of this resource, then 20,740 acres are available. This translates to a technical potential close to 4,000 MW. This is significant since the current peak power demand of the San Diego region is 4500 MW and the peak load (air conditioning) occurs when the sun is most intense.

The major assumption that this analysis rests on is the creation and vigorous implementation of renewable energy parks with-in San Diego County. It is unlikely that solar energy plant contractors would willingly attempt to site over 1,100 MW capacity sprinkled over 50 to 150 sites. They would rather pick one or two desert sites to accomplish this and let others worry about constructing transmission lines to the city. The difficulty of about 100 sets of siting would deter all but the very strong hearted.

The energy park idea is to remove most of the initial barriers to small power plant siting. This would involve the plant site to be chosen, the land to be purchased or leased, the zoning changes arranged, the local, county, state and federal (if needed) approval process to be started along with “generic” environment impact assessment. The local grid connection and other utilities would be arranged and the site readied for start of plant construction. This site would be put in the energy land bank and thus made available for rapid plant startup when the date was established for the needed power and the local utility sought to sign a power purchase agreement with a power plant builder.

Since this 50/50 goal was generated by SANDAG which has as its members, all 19 local political entities in San Diego County. The proactive support of these separate political entities that make up the SANDAG board in streamlining their internal procedures, would make a major contribution to bringing this concept to life.

This two step approach is recommended. The first step would be taken by the local political entities (some of the 19 local jurisdictions in San Diego County) to streamline their evaluation and approval process to expedite the processing of the 100 or so small power plants. The second step is for San Diego County to contribute the up-front costs for studies and the land acquisition or lease. This second step could also be taken by SANDAG to petition the CPUC to support the renewable energy park concept and establish the procedures to authorize and allow funding of all the activities needed to create the energy park.

2. Creating a Sustainable Economy – San Diego/Tijuana Case Study (Jim Bell, 2nd edition, March 2007)

Jim Bell is a sustainable resource planner who has been heavily involved in energy planning in the San Diego area for many years. The second edition of his book “*Creating a Sustainable Economy and Future on Our Planet - San Diego/Tijuana Region Case Study*” was published in March 2007. Mr. Bell’s analysis emphasizes the development of a sustainable local energy economy through maximum use of commercial and residential PV systems. The main elements of his analysis for achieving energy self-sufficiency are described in the following paragraphs.

“Our region is so rich in renewable energy resources that we could easily become energy self-sufficient even without energy-use efficiency improvements. For example, even with zero efficiency improvements, San Diego County could be self-sufficient for electricity through 2050 if 34 percent (48 square miles) of the 140 square miles of county land projected to be covered by roofs and parking lots in 2050 if they were covered by photovoltaic (PV) systems. For comparison in 2005, an estimated 110 square miles of county land was already covered by roofs and parking lots.

With a 40 percent increase in efficiency only 20 percent (29 square miles) of the county’s roofs and parking lots would need to be covered for the county to be self-sufficient for electricity through 2050. Without efficiency improvements, covering 86 percent (121 square miles) of our county’s projected 140 square miles of roofs and parking lots in 2050 with PV systems would produce enough electricity to replace all the imported energy projected to be used in San Diego County in that year. With a 40 percent increase in energy use efficiency,

only 52 percent (73 square miles) of the county's roofs and parking lots, would need to be covered with PV systems for San Diego County to self-sufficient for all energy sources through 2050. Coupling a 40 percent improvement in efficient energy use with covering 100 square miles of roofs and parking lots with PV systems, the county would become a large energy exporter. An additional 37 square miles of PV production at \$0.10 per kWh would bring in \$1.8 billion per year of revenue.

At \$0.10 per kWh, regional energy self-sufficiency in 2002 would have kept about \$7 billion in San Diego/Tijuana region, \$5.2 billion in San Diego County alone. According to economic multiplier theory, adding \$7 billion to our local economy each year would increase local yearly economic activity by \$14 billion.”

3. Green Energy Options to Replace the South Bay Power Plant (Local Power, February 2007, prepared for Environmental Health Coalition)

The Green Energy Options (GEOs) are three electric energy portfolios designed to meet three different levels of capacity replacement for the South Bay Power Plant. They address a range of possible regional needs and provide a range of investment options. The current power plant supplies electricity in the period of high demand during the day and early evenings, and the GEO portfolios are designed to meet that same requirement. Each GEO portfolio includes diverse technologies in order to avoid “putting all eggs in one basket”.

The GEOs provide three levels of capacity replacement relative to the current 700 megawatt power plants. The nominal capacity of the GEO options range between 660 megawatts and 1150 megawatts, but this translates into a smaller equivalent capacity for the purposes of replacing the existing plant. This is because some renewable technologies, mainly wind power, only produce electricity part of the time. But the wind resource is given a boost relative to its otherwise intermittent nature, since one portion of the wind power is delivered to pump water uphill into a reservoir during the evening so it is available the next day to power generators when demand for electricity is high. Nearly all the rest of the portfolio’s generation capacity is considered to be able to carry its weight in electrical system support, without any greater degree of help than other types of electrical generation routinely receive. This rating, called the Effective Load Carrying Capacity, is a product of the full capacity of the power generation equipment and the availability of the energy resource. In the case of wind, studies have shown that the *lowest* “carrying capacity” for actual major California wind farms is about 25 percent. We have been even more conservative, and assumed that only 20 percent would “count”.

The targets are established as meeting 50 percent, 70 percent and 90 percent of the current South Bay Power Plant’s capacity for supplying power during the hours of peak demand. Thus the portfolio is designed to meet the same needs and have similar functionality to the existing plant, though with a number of extended capabilities that the current plant does not have. For instance, the pumped storage plant can respond nearly instantly to changes in demand for electricity, a factor that can be critical during a power emergency. A summary of the energy replacement options for South Bay are provided in the following table:

Summary of Energy Portfolio Replacement Options for South Bay

Facility	50 percent		70 percent		90 percent	
	MW	GWh	MW	GWh	MW	GWh
Wind farm	150	460	325	990	400	1,200
Pumped water storage	60	250	90	250	150	420
Concentrating solar	160	450	160	450	160	450
Natural gas peaker	90	250	190	530	240	670
PV	20	30	20	30	20	30
Peak demand reduction	20	35	20	35	20	35
Transmission	--	--	--	--	--	--
Replacement target (MW)	350		490		630	
Electricity generation (GWh)	1,270		1,960		2,270	
Ave. peak power cost (¢/kWh)	8.7-10.4		8.4-10.8		8.5-10.3	

Community Choice Aggregation (CCA) is the best approach to eliminating the need for power generation on the South Bay. CCA would enable a full range of options, including transmission of power. If Chula Vista forms a CCA or builds a power generation facility, it may elect to obtain transmission services within or outside Chula Vista, by acquiring access to existing transmission capacity, arranging with SDG&E to provide transmission access, pursuant to Federal Energy Regulatory Commission (FERC) Order 888, or arranging to purchase transmission services from another party such as a tribal government. No option would require adding transmission lines leading outside the county, and all would make use of existing transmission pathways.

In addition, Chula Vista and a number of potential public partners may issue municipal revenue bonds (“H Bonds”) to finance renewable energy and conservation facilities.

A critical facet of the GEO options is to include local power resources that require little or no transmission facilities to deliver the power to customers. Chula Vista and the San Diego County region offer opportunities to develop a variety of green energy resources. These opportunities include solar energy, energy conservation, and cogeneration, in coordination with parties interested in participating in the development of the facilities and/or the purchase of power from such facilities. Where transmission of electricity is required, the GEO options have sought to insure that existing transmission corridors can be used, to avoid most of the expense and environmental impact of any new facilities. The GEO options are also designed to reduce the need for importing renewable power, and natural gas, from outside the county.

Photovoltaics (PV) on Chula Vista rooftops, energy efficiency, demand response may be fundable with existing ratepayer revenue if a CCA is formed and would be facilitated by submitting a request to administer the funds to the California Public Utilities Commission.

Other distributed generation may be undertaken within the City under a CCA or a revenue bond funded (“H Bond”) program, and Chula Vista may invest General Funds in renewable energy projects for non-CCA customers if the City wishes to operate the plant as a public enterprise.

Renewable and conservation facility assets will retain their market value and generate revenue after the revenue bonds or other financing are repaid, in some cases for decades, offering both

returns on public investment and very low cost energy for local government, residents and businesses.

4. Potential for Renewable Energy in the San Diego Region (San Diego Regional Renewable Energy Study Group, August 2005, www.renewablesg.org)

The purpose of this study was to estimate the size of the regional renewable energy resource base and the approximate cost of renewable energy power generation. The projected regional renewable energy technical potential is summarized in the following table:

Region's Renewable Energy Technical Potential in 2020¹

SOLAR PV - Commercial and Residential			SOLAR - Concentrating Solar Power (CSP)			WIND		
	Capacity (MW AC)	Energy (GWh)		Capacity (MW AC)	Energy (GWh)	Capacity (MW)	Energy (GWh)	
SD County	4,691	10,224	SD County	2,900	5,080	SD County & Parts of Imperial County and Northern Baja California, Mexico		
			Imperial County	29,000	50,808	1,650 - 1,830	4,530 - 5,020	
BIOMASS (SD County)			SMALL HYDRO			GEOTHERMAL		
	Capacity (MW)	Energy (GWh)		Capacity (MW)	Energy (GWh)	Capacity (MW)	Energy (GWh)	
Landfill Gas	72	505	SD County	8.32	15	Imperial County	2,500	22,000
Other Biomass	75	525	Imperial County	86.5	152	Northern Baja CA, Mexico	840	6,000
			Northern Baja CA, Mexico	75	131			

The SDG&E system peak demand for 2004 was 4,065 MW. Total energy requirement in the region, include customers served by SDG&E as well as other energy providers, was 20,578 GWh.

The estimated peak demand technical potential of residential and commercial PV in 2010 is 4,400 MW, with an annual energy production of approximately 6,600 GWh. The estimated peak demand technical potential of residential and commercial PV in 2020 is 4,700 MW, with an annual energy production of approximately 7,000 GWh. This PV estimate does not include the technical PV potential of parking areas and parking structures. The technology potential of CSP technology in more rural areas of San Diego County was estimated at 2,900 MW and 5,000 GWh.

Solar trough was the only concentrating solar power (CSP) technology evaluated. There are 354 MW of solar trough CSP plants in operation in California. Dish Stirling, the CSP technology that SDG&E has contracted for in Imperial Valley, was identified as a pre-commercial technology in the report and was not evaluated for that reason.

Thermal Energy Storage

Thermal energy storage (TES) systems shift energy usage to a later period to take advantage of cheaper time-based utility rates and/or to reduce overall energy demand. In California, the primary use of thermal energy storage is for cool storage since summer air conditioning is the dominant electric load. Cooling storage mediums of choice are water, ice, and eutectic salts.

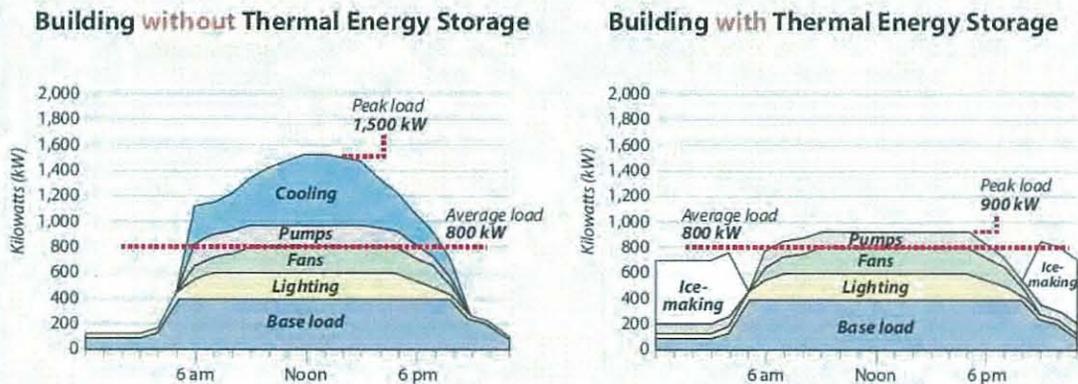

TES systems produce chilled water (or ice) during the night and store for use during the day. This allows central plant equipment to operate at night when energy is readily available, cheaper, and the chiller equipment can run more efficiently. By doing so, buildings can reduce peak demand on the electrical grid and decrease their electrical usage and demand costs.

Benefits of Thermal Energy Storage:

- 1 Reduce peak demand
- 2 Decreased electric usage and demand costs.
- 3 Increased central plant redundancy
- 4 Reduced emissions from inefficient peaker plants
- 5 Reduced chiller plant size and corresponding infrastructure

DAILY ELECTRICITY LOAD

These two graphs show electrical load profiles for similar buildings with and without Thermal Energy Storage. The graph on the left represents a building without TES. The graph on the right represents a building with TES, where all the ice making is done at night, during off-peak hours.

2007 Energy-Efficiency Rebates for Your Home

When shopping for a new appliance or considering a home improvement, think energy efficiency. It helps you save energy for many years to come, and could contribute to lower energy bills at your home. Helping you be more energy-efficient is one of the ways SDG&E® strives to provide exceptional customer service. Here are the rebates SDG&E offers for single family homes.

ENERGY-EFFICIENT MEASURE

YOUR REBATE

Appliances

Dishwasher ENERGY STAR®-qualified (Energy Factor of 0.65 or greater)	\$30/unit
Refrigerator ENERGY STAR®-qualified	\$50/unit
Refrigerator (or freezer) recycling, with free pickup	\$35/unit

Recycling program run by a 3rd party, not SDG&E. For more on the recycling program call them at 1-800-599-5792.

Cooling/Heating

Room Air Conditioner ENERGY STAR®-qualified	\$50/unit
Whole House Fan (Must have existing central air conditioning to qualify)	\$50/unit
Central Natural Gas Furnace (+ 92% AFUE)	\$200/unit

Insulation

Attic or Wall Insulation	\$0.15/sq. ft.
--------------------------	----------------

Swimming Pool

Pool pump and motor - single speed	\$30/unit
Pool pump and motor with automatic controller- multi speed	\$100/unit
Time Clock Reset	\$25/pool

(Must reduce filtering time by two hours or more and filter during off-peak hours - before noon or after 6PM - daily.)

Water Heaters (minimum storage of 30 gallons)

Efficient Natural Gas (Energy Factor of 0.62 or greater)	\$30/unit
Electric Water Heater (Energy Factor of 0.93 or greater)	\$30/unit

Before you buy:

Please review the application for specific requirements and rebate qualifications. Applications for rebates are accepted on a first-come, first-served basis until program funds are no longer available. The amount and availability of rebates may change during the year. Rebates apply only to specific makes and models.

SDG&E and participating retailers are now making it easy for customers to receive rebates instantly. There is no need to fill out an application and wait for a check; instead, the rebate amount is taken off the purchase price at the point of sale. Only one rebate per item - items rebated at the point of sale do not qualify for a mail-in rebate.

Mail-in rebate applications and the list of participating instant rebate retailers are available at www.sdge.com. For more information, call the Energy Information Center at **1-800-644-6133** or e-mail info@sdge.com. The Energy Information Center is open Monday through Friday, 8am to 5pm.

The Energy Efficiency Rebate Program may be modified or terminated without prior notice. SDG&E is not responsible for any particular contractor selected or equipment/materials installed, or for purchases not meeting applicable qualifications. SDG&E is not responsible for any goods and services obtained by the customer from third parties. This program is funded by California utility customers and administered by SDG&E, under the auspices of the California Public Utilities Commission.

Attachment J: San Diego Solar Initiative \$1.5 Billion Financing Plan to Achieve 50% GHG Reduction

Overview

The San Diego Solar Initiative financial plan described in this attachment, with a \$1.5 billion photovoltaic (PV) incentives budget, results in the installation of 3,004 MW of direct current PV without battery storage. However, as shown on p. J9 titled "PV Installations by Month," there is some degradation in PV performance over time. This results in a net installed direct current PV capacity of 2,941 MW in 2018.

The PV panels generate direct current (DC) electricity. All buildings or residences that receive electricity from the transmission grid use alternating current (AC) electricity. The DC electricity from the PV panels must be converted to alternating current (AC) via an inverter to be compatible with the AC electricity moving over the transmission grid. About a quarter of the potential power is lost in this conversion process.

There are significant losses in converting the DC power from the panels into AC power ready for transmission over the grid. The assumption used in estimating the AC capacity that will be installed under the San Diego Solar Initiative is that only 77 percent of the maximum DC power potential of the panels is converted to AC power. The AC output from 2,941 MW of direct current PV is $0.77 \times 2,941 \text{ MW} = 2,265 \text{ MW}$. The total amount of grid-compatible AC capacity that would be installed under the San Diego Solar Initiative, if no battery storage is included, is 2,265 MW.

PV systems that are equipped with sufficient battery storage can continue to operate at rated capacity during the afternoon peak demand period. This is when electric power is most needed and most valuable. Southern California Edison began a demonstration project using rooftop PV systems as peaking plants in the summer of 2007. These demonstration units use Gaia Power Towers for storage and energy management. Use of Gaia Power Towers adds somewhat less than 10 percent to the gross PV system cost.

A basic assumption of the San Diego Solar Initiative is that all PV installed under the Initiative would be equipped with battery storage to allow this PV capacity to be available to meet afternoon peak demand. Ten (10) percent of the incentives budget is allocated to the purchase of battery storage and associated control hardware instead of PV panels. Therefore the net PV capacity is reduced 10 percent from the 2,265 MW AC figure to allow for all of these PV systems to be equipped with battery storage. The net PV capacity with battery storage is $2,265 \text{ MW} - (2,265 \text{ MW} \times 0.10) = 2,040 \text{ MW}$.

The San Diego Solar Initiative with a \$1.5 billion incentives budget would result in 2,040 MW AC of net rooftop PV with battery storage being added to the generation base in San Diego County.

Total - San Diego Solar Initiative, \$1.5 billion incentives budget

1. Solar Electricity Production (MWh)					
Initial Year of Operation*	Total Solar Electricity Produced	% of Total MWhs	Large Systems	Small Systems	Residential
2008	1,811	0.0%	1,409	201	201

Attachment K: San Diego Solar Initiative Financing Plan Limited to \$700 Million Solar Incentives Budget

Overview

The limited San Diego Solar Initiative financial plan described in this attachment, with a \$700 million photovoltaic (PV) incentives budget, results in the installation of 1,346 MW of direct current PV without battery storage. However, as shown on p. K9 titled "PV Installations by Month," there is some degradation in PV performance over time. This results in a net installed direct current PV of 1,332 MW in 2018.

The PV panels generate direct current (DC) electricity. All buildings or residences that receive electricity from the transmission grid use alternating current (AC) electricity. The DC electricity from the PV panels must be converted to alternating current (AC) via an inverter to be compatible with the AC electricity moving over the transmission grid. About a quarter of the potential power is lost in this conversion process.

There are significant losses in converting the DC power from the panels into AC power ready for transmission over the grid. The assumption used in estimating the AC capacity that will be installed under the San Diego Solar Initiative is that only 77 percent of the maximum DC power potential of the panels is converted to AC power. The AC output from 1,332 MW of direct current PV is $0.77 \times 1,332 \text{ MW} = 1,026 \text{ MW}$. The total amount of grid-compatible AC capacity that would be installed under the San Diego Solar Initiative, if no battery storage is included, is 1,026 MW.

PV systems that are equipped with sufficient battery storage can continue to operate at rated capacity during the afternoon peak demand period. This is when electric power is most needed and most valuable. Southern California Edison began a demonstration project using rooftop PV systems as peaking plants in the summer of 2007. These demonstration units use Gaia Power Towers for storage and energy management. Use of Gaia Power Towers adds somewhat less than 10 percent to the gross PV system cost.

A basic assumption of the San Diego Solar Initiative is that all PV installed under the Initiative would be equipped with battery storage to allow this PV capacity to be available to meet afternoon peak demand. Ten (10) percent of the incentives budget is allocated to the purchase of battery storage and associated control hardware instead of PV panels. Therefore the net PV capacity is reduced 10 percent from the 1,026 MW AC figure to allow for all of these PV systems to be equipped battery storage. The net PV capacity with battery storage is $1,026 \text{ MW} - (1,026 \text{ MW} \times 0.10) = 923 \text{ MW}$.

The limited version of the San Diego Solar Initiative with a \$700 million incentives budget would result in 923 MW AC of net rooftop PV with battery storage being added to the generation base in San Diego County.

Total - Limited San Diego Solar Initiative, \$700 million incentives budget

1.3.4 ENERGY STORAGE

Technology Description

Advanced storage technologies under active development include processes that are mechanical (flywheels, pneumatic), electrochemical (advanced batteries, reversible fuel cells, hydrogen, ultracapacitors), and purely electrical (superconducting magnetic storage). Energy storage devices are added to the utility grid to improve productivity, increase reliability or defer equipment upgrades. Energy storage devices must be charged and recharged with electricity generated elsewhere. Because the storage efficiency (output compared to input energy) is less than 100%, on a kilowatt-per-kilowatt basis, energy storage does not directly

A 5-MVA battery energy-storage system for power quality and peak shaving.

decrease CO₂ production. The exception to this rule is the use of advanced energy storage in conjunction with intermittent renewable energy sources, such as photovoltaics and wind, that produce no direct CO₂. Energy storage allows these intermittent resources to be dispatchable.

Energy-storage devices do positively affect CO₂ production on an industrial output basis by providing high-quality power, maximizing industrial productivity. New battery technologies, including sodium sulfur and flow batteries, significantly improve the energy and power densities for stationary battery storage as compared to traditional flooded lead-acid batteries.

System Concepts

- Stationary applications:* The efficiency of a typical steam-power plant falls from about 38% at peak load to 28%-31% at night. Utilities and customers could store electrical energy at off-peak times, allowing power plants to operate near peak efficiency. The stored energy could be used during high-demand periods displacing low-efficiency peaking generators. CO₂ emissions would be reduced if the efficiency of the energy storage were greater than 85%. Energy storage also can be used to alleviate the pressure on highly loaded components in the grid (transmission lines, transformers, etc.) These components are typically only loaded heavily for a small portion of the day. The storage system would be placed downstream from the heavily loaded component. This would reduce electrical losses of overloaded systems. Equipment upgrades also would be postponed, allowing the most efficient use of capital by utility companies. For intermittent renewables, advanced energy storage technology would improve their applicability.
- Power quality:* The operation of modern, computerized manufacturing depends directly on the quality of power the plant receives. Any voltage sag or momentary interruption can trip off a manufacturing line and electronic equipment. Industries that are particularly sensitive are semiconductor manufacturing, plastics and paper manufacturing, electronic retailers, and financial services such as banking, stock brokerages, and credit card-processing centers. If an interruption occurs that disrupts these processes, product is often lost, plant cleanup can be required, equipment can be damaged, and transactions can be lost. Any loss must be made up decreasing the overall efficiency of the operation, thereby increasing the amount of CO₂ production required for each unit of output. Energy-storage value is usually measured economically with

the cost of power-quality losses, which is estimated in excess of \$1.5 B/year in the United States alone. Industry is also installing energy-storage systems to purchase relatively cheap off-peak power for use during on-peak times. This use dovetails very nicely with the utilities' interest in minimizing the load on highly loaded sections of the electric grid. Many energy-storage systems offer multiple benefits. (An example is shown in the photo.) This 5-MVA, 3.5-MWh valve-regulated lead-acid battery system is installed at a lead recycling plant in the Los Angeles, California, area. The system provides power-quality protection for the plant's pollution-control equipment, preventing an environmental release in the event of a loss of power. The system carries the critical plant loads while an orderly shutdown occurs. The battery system also in discharged daily during the afternoon peak (and recharged nightly), reducing the plant's energy costs.

Representative Technologies

For utilities, the most mature storage technology is pumped hydro; however, it requires topography with significant differences in elevation, so it's only practical in certain locations. Compressed-air energy storage uses off-peak electricity to force air into underground caverns or dedicated tanks, and releases the air to drive turbines to generate on-peak electricity; this, too, is location specific. Batteries, both conventional and advanced, are commonly used for energy-storage systems. Advanced flowing electrolyte batteries offer the promise of longer lifetimes and easier scalability to large, multi-MW systems. Superconducting magnetic energy storage (SMES) is largely focused on high-power, short-duration applications such as power quality and transmission system stability. Ultracapacitors have very high power density but currently have relatively low total energy capacity and are also applicable for high-power, short-duration applications. Flywheels are now commercially viable in power quality and UPS applications, and emerging for high power, high-energy applications.

Technology Status - Utilities					
Technology	Efficiency [%]	Energy density [W-h/kg]	Power density [kW/kg]	Sizes [MW-h]	Comments
Pumped hydro	75	0.27/100 m	low	5,000-20,000	37 existing in U.S.
Compressed gas	70	0	low	250-2,200	1 U.S., 1 German
SMES	90+	0	high	20 MW	high-power applications
Batteries	70-84	30-50	0.2-0.4	17-40	Most common device
Flywheels	90+	15-30	1-3	0.1-20 kWh	US & foreign development
Ultracapacitors	90+	2-10	high	0.1-0.5 kWh	High-power density

System Components

Each energy-storage system consists of four major components: the storage device (battery, flywheel, etc.); a power-conversion system; a control system for the storage system, possibly tied in with a utility SCADA (Supervisory Control And Data Acquisition) system or industrial facility control system; and interconnection hardware connecting the storage system to the grid. All common energy-storage devices are DC devices (battery) or produce a varying output (flywheels) requiring a power conversion system to connect it to the AC grid. The control system must manage the charging and discharging of the system, monitor the state of health of the various components and interface with the local environment at a minimum to receive on/off signals. Interconnection hardware allows for the safe connection between the storage system and the local grid.

Current Research, Development, and Demonstration

RD&D Goals

- Research program goals in this area focus on energy-storage technologies with high reliability and affordable costs. For capital cost this is interpreted to mean less than or equal to those of some of lower cost new power generation options (\$400-\$600/kW). Battery storage systems range from \$300-\$2000/kW. For operating cost, this figure would range from compressed gas energy storage, which can cost as little as \$1 to \$5/kWh, to pumped hydro storage, which can range between \$10 and \$45/kWh.

RD&D Challenges

- The major hurdles for all storage technologies are cost reduction and developing methods of accurately identifying all the potential value streams from a given installation. Advanced batteries need field experience and manufacturing increases to bring down costs. Flywheels need further development of fail-

Olivenhain-Hodges Pumped Storage Project

FACT SHEET

The Water Authority is a public agency serving the San Diego region as a wholesale supplier of water. The Water Authority works through its 23 member agencies to provide a safe, reliable water supply to support the region's \$130 billion economy and the quality of life of 3 million residents.

San Diego County
Water Authority

4677 Overland Ave.
San Diego, CA

(858) 522-6700
www.sdcwa.org

The Olivenhain-Hodges Pumped Storage Project is an integral component of the Lake Hodges projects, providing electrical generating capacity while enhancing Emergency Storage Project requirements to ensure regional water reliability.

Background

In 2005, the Water Authority is scheduled to begin construction of the Lake Hodges projects, which include the Lake Hodges to Olivenhain Pipeline and the Lake Hodges Pump Station/Inlet-Outlet structure.

- The Lake Hodges to Olivenhain Pipeline is a 1¼-mile-long water transmission tunnel between the Lake Hodges Pump Station and Olivenhain Reservoir.
- The Lake Hodges Pump Station/Inlet-Outlet structure, located at Lake Hodges, will pump water from the lake to the Olivenhain Reservoir. It will also control the flow of water from Olivenhain Reservoir to Lake Hodges.

By providing a means to convey water between Lake Hodges and the Olivenhain Reservoir, these projects will increase operational flexibility and water storage capacity for San Diego County. The water will also be available for emergency use in case of a natural disaster such as earthquake or drought. Water pumped from Lake Hodges to Olivenhain Reservoir can readily be conveyed to the Water Authority's Second Aqueduct for further distribution throughout the county.

Conserving Energy

During the planning phase of the Lake Hodges projects' design, the Water Authority recognized the

hydroelectric generating potential of the 770-foot elevation difference between Olivenhain Reservoir and Lake Hodges. The Lake Hodges Pump Station, as originally planned, contained three vertical pumps and two pressure-control valves. By replacing the pressure-control valves, pumps and motors with reversible motor-generator/pump turbines and appropriately sizing the tunnel pipeline, all of the elements of a pumped-storage capability became available. Energy created during the transfer of water from the Olivenhain Reservoir to Lake Hodges

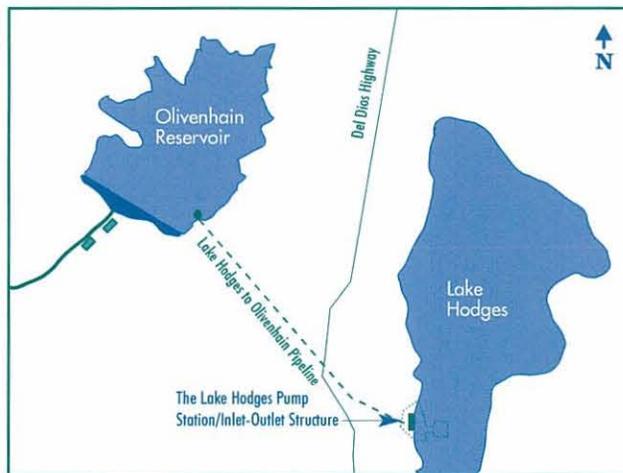

would now be captured and utilized in the region. This captured energy will provide revenue to pay back the cost of the pumped-storage equipment and facilities and support other Water Authority activities.

The Lake Hodges Pump Station's pump-turbines will produce a maximum output of 40 megawatts during

water transfers from Olivenhain Reservoir to Lake Hodges. The electricity generated will be transmitted to an outdoor switchyard located adjacent to the pump station, then to a 1,400-foot-long transmission line that will connect to the existing local transmission system.

The original above-ground pump station structure was modified to be mostly below ground to accommodate the pumped storage equipment, providing the added benefit of reduced visual impact to the area.

When considering both revenue generated and energy saved, the pumped-storage facility will be a major enhancement to the Lake Hodges projects. Construction of the Lake Hodges projects is scheduled to be complete by 2008.

FuelCell Energy
World Leader in Secure. Ultra-Clean Power

Sheraton San Diego

problem: Starwood Hotels, managers of the Sheraton San Diego Hotel & Marina in San Diego, California, sought to find an affordable and efficient means of producing environmentally-friendly baseload electrical power for this popular hotel and resort.

solution: FuelCell Energy® provided the answer, installing a one-megawatt (1 MW) stationary fuel cell power plant made up of four 250-kilowatt Direct FuelCell® 300A (DFC300A®) power plants from FuelCell Energy that are classified as an "Ultra-Clean" technology under California law, thus qualifying the new system for considerable financial subsidies. Benefits such as high-reliability, ultra-low emissions, and quiet operation made the fuel cell system a perfect fit for the hotel's needs. As an added benefit, heat produced within the fuel cell is used to support the hotel's hot water needs and to heat three of the facility's large pools.

result: The fuel cell plant supplies 60 - 80% of the hotel's baseload power requirements. Inconspicuously located adjacent to the

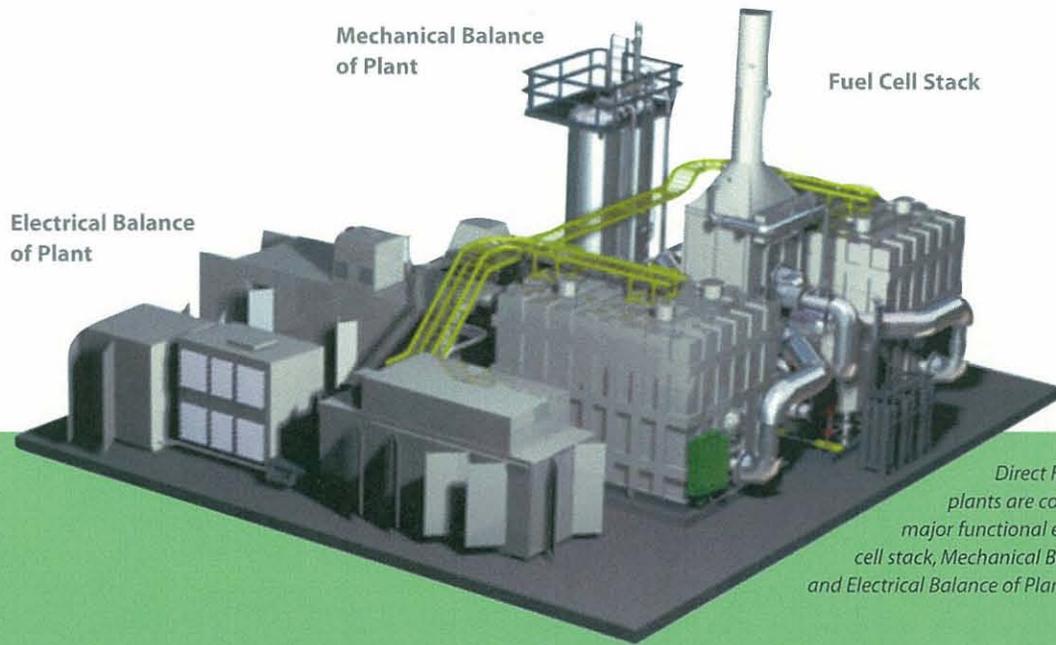

Sheraton's tennis courts, the fuel cell system generates so little noise pollution, it is virtually unnoticeable. The system has proven very reliable, attaining a reliability rating of more than 98% since operation began.

The power plant has also generated substantial interest from hotel guests, who are curious about the new power system and how it operates. In fact, the Sheraton estimates they have booked more than 1,000 rooms in the last year due to interest in the fuel cell system, and their reputation for environmentally-friendly practices.

About DFC Power Plants

FuelCell Energy's DFC systems are self-contained commercial-grade power plants providing high-quality, baseload electric power using biofuels – gases from wastewater treatment, food processing, and landfills – in addition to natural gas.

Direct FuelCells power plants are comprised of three major functional elements; the fuel cell stack, Mechanical Balance of Plant and Electrical Balance of Plant.

As a result of the resounding success attained after one year of operating the initial 1 MW fuel cell plant, Starwood added a second fuel cell installation to the property in July 2006. Two 250-kilowatt DFC300MA™ fuel cells were installed at the West Tower portion of the property, bringing the total power output to 1.5 MW, making it the single largest commercial fuel cell installation in the world. The West Tower fuel cell plant provides 100% of the power requirement and 100% of the domestic hot water heat source for the West Tower.

About Starwood Hotels

Starwood Hotels & Resorts Worldwide, Inc. is one of the leading hotel and leisure companies in the world with approximately 870 properties in more than 100 countries.

Starwood owns, operates, and franchises such internationally renowned brands as St. Regis®, The Luxury Collection®, Sheraton®, Westin®, Four Points® by Sheraton, W® Hotels and Resorts, and Starwood Vacation Ownership, Inc. For more information, please visit www.starwoodhotels.com.

About FuelCell Energy

FuelCell Energy develops and markets Ultra-Clean power plants that generate electricity with higher efficiency than distributed generation plants of similar size and with virtually no air pollution. For more information on the company, its products, and its world-wide commercial distribution alliances, please visit www.fuelcellenergy.com.

World Leader in Secure, Ultra-Clean Power

Attachment O: Clean Energy Coalition Letter to Chairman of Maryland Public Service Commission

August 17, 2007

Chairman Steven B. Larsen
Maryland Public Service Commission
6 St. Paul Street, 16th Floor
Baltimore, MD 21202

Mr. Karl V. Pfirman
Interim President and CEO
PJM, LLC
955 Jefferson Avenue
Valley Forge Corporate Center
Norristown, PA 19403-2497

Dear Chairman Larsen and President Pfirman:

We write you as a coalition of clean energy developers to urge that the Maryland Public Service Commission undertake a thorough study of specific renewable energy and demand management measures as an alternative to the proposed Amos, West Virginia to Kempton, Maryland transmission expansion project.

Though comprehensive capacity numbers have not yet been released, we understand that the 290 mile, estimated \$1.8 billion line, proposed for completion in 2012, is required to service approximately 1800 MW in demand. We understand that the electricity will be wheeled in from coal fired power plants in the Midwest.

As you are no doubt aware, landmark legislation passed by the General Assembly and signed by Governor O'Malley has placed Maryland on track to add approximately 1500 MW of solar energy over the next 15 years. It is our considered opinion that accelerating the deployment of peak-coincident solar energy, along with other high efficiency distributed generation and "smart grid" technologies, can offset the need for the Amos – Kempton line.

We believe that this accelerated, continuous development could be had at a ratepayer cost less than the proposed \$1.8 billion and with significantly reduced delivery and financial risk as compared to a single massive transmission corridor.

Amos - Kempton Line: "Smart Energy Alternative" (low case, approximate)

Further, these resources would bring low-emissions *generation* capability into Maryland. The choice is between expending ratepayer funding on low-risk, low-emissions distributed generation, or relying on a single, controversial, high-risk project that will only enable the export of our energy dollars to produce air pollution upwind.

It is time that the PJM and the Commission begin to consider alternatives to the expensive solutions provided by 20th century technologies.

Collectively the undersigned are convinced we can provide at least 1800 MW of distributed generation and resources in the specified time frame. Based on the information available, we feel that this should be sufficient to offset the relevant congestion concerns.

However, we cannot provide a more accurate or thorough analysis of this alternative without access to PJM's modeling capabilities. We urge you to have the probabilistic consumption models used by PJM adapted to the scenario we present, and we stand ready to provide the appropriate inputs and generator profiles.

With almost two billion dollars on the table, and facing profound and controversial changes to the landscape, we feel that the Commission and PJM have the responsibility to consider all practicable alternatives. We would sincerely appreciate the opportunity to discuss our alternative in greater depth and contribute to the development of a more thorough and comprehensive analysis for Maryland.

Sincerely,

San Diego Smart Energy 2020 – The 21st Century Alternative –

Prepared by:

E-Tech International
Santa Fe, New Mexico

Author: Bill Powers, P.E.

October 2007

This report is available on the E-Tech International website: www.etchinternational.org

This report was funded by the San Diego Foundation's Environment Program. The San Diego Foundation is not responsible for the research method, content, calculations or dissemination of this report. Funding of this report does not imply endorsement of its findings nor its recommendations, but rather an interest in understanding the range of options available to pursue a clean and sustainable energy future for the San Diego region. The Foundation is committed to supporting the efforts of local nonprofit and community-based organizations, to engage in civic discourse on issues of regional environmental importance.

The author would like to acknowledge the numerous informal reviewers as well as the following individuals for reviewing the draft document and providing comments:

Henry Abarbanel: Co-Chair, San Diego Association of Governments Regional Energy Working Group
Scott Anders: Director, Energy Policy Initiatives Center, University of San Diego School of Law
Richard Caputo: President, San Diego Renewable Energy Society
Don Wood: Senior Policy Advisor, Pacific Energy and Policy Center, La Mesa

About the author:

Bill Powers, P.E., is an expert on regional power provision, with extensive knowledge and experience in the fields of energy and mechanical engineering, air monitoring and control equipment, and pollution and public health. He is internationally renowned for his work in the energy field, providing expert testimony and analysis, project management, strategic planning, and equipment testing and monitoring for private energy project developers throughout the world, including the United States, Mexico, Peru, Venezuela, Panama, and Chile.

Mr. Powers has served as the U.S. co-chair of the San Diego-Tijuana EPA/SEMARNAT Border 2012 Air Work Group, a federal initiative which develops programs to reduce air pollution along the international border. He is also co-chair of the Border Power Plant Working Group, a binational organization which advocates for sustainable energy projects in the border region. In addition, he is a member of San Diego Association of Governments Regional Energy Working Group.

Mr. Powers has authored numerous technical reports on a variety of energy-related topics, including gas turbine air emission controls, power plant cooling systems, integrating strategic energy and environmental planning in the California – Baja California border region, and use of integrated gasification combined cycle power generation to facilitate carbon dioxide capture and sequestration in Midwestern coal-burning states. He received his Bachelor of Science in Mechanical Engineering from Duke University and Masters of Public Health – Environmental Sciences from the University of North Carolina. Mr. Powers has been a registered professional engineer in California since 1986.

1. Executive Summary

The San Diego region is poised on the brink of a new energy future, and the path it charts now will determine in large part the success of its people, its economy, and its ability to provide a cleaner, more secure energy supply for generations to come.

San Diego Smart Energy 2020 paves the way for a shift from reliance on fossil fuels and imported power to an array of local solutions that include energy efficiency measures with emphasis on high efficiency air conditioning systems; common-sense weatherization and conservation; the proven technology of solar photovoltaic (PV) panels, for large commercial use as well as on homes; small, highly efficient natural gas-fired power plants that generate both power and heating/cooling; adoption of smart grid procedures that improve the efficiency of the grid by monitoring and controlling the flow of electricity on a continuous basis; and the widespread institution of green building design principles.

San Diego Smart Energy 2020, the strategic energy plan for San Diego County described in this report, provides a working blueprint of realistic methods to reduce greenhouse gases from power generation by 50 percent over current levels by 2020 while increasing the total electricity supply from renewable energy resources and maximizing locally generated power. The plan is economically feasible for residents and businesses alike.

Finding 1: Climate Change Must Drive Strategic Energy Planning

The *Global Warming Solutions Act* (AB 32, September 2006) commits California to reducing greenhouse gases by 25 percent to 1990 levels by 2020, and by 80 percent by 2050.

San Diego Gas & Electric (SDG&E) is currently projecting a 20 percent reduction in greenhouse gas emissions over the next decade as part of its strategic plan. This reduction will principally be achieved by meeting the state mandate of 20 percent renewable energy generation by 2010. However, SDG&E's parent company, Sempra Energy, will begin shipping liquefied natural gas north through SDG&E's pipeline system from its Baja California liquefied natural gas terminal in 2009. The lifecycle greenhouse gas burden of liquefied natural gas, including processing, liquefying, transport, and regasification, is approximately 25 percent greater than that of the domestic natural gas SDG&E is currently supplying. The SDG&E greenhouse gas projection, provided in SDG&E's 2007-2016 Long-Term Procurement Plan, does not take into account the generation of additional greenhouse gases associated with the conversion from domestic natural gas to imported liquefied natural gas. This conversion will nullify the greenhouse gas reductions projected by SDG&E over the next decade.

A much more significant shift from fossil fuel to renewable energy sources will be required if the San Diego region is to reduce its greenhouse gas emissions at the maximum rate that is cost-effectively achievable.

Finding 2: A Secure Energy Future Requires an Increase in Local Power Generation and a Decreased Dependence on Natural Gas

Approximately two-thirds of the electric power used in the San Diego region is currently generated by coal-fired (12 percent) and natural gas-fired (53 percent) combustion sources. The power is imported along existing transmission lines as well as being generated by local power plants.

Virtually all local power generation sources burn natural gas. The price of natural gas has nearly tripled since 2002, and remains highly volatile. The high price of natural gas has made renewable energy sources more-cost effective when compared to natural gas-fired power generation sources.

San Diego's political, business, environmental, and community leaders have a history of innovative thinking in planning for the region's energy future. In 2003, the San Diego Association of Governments (SANDAG) adopted the *San Diego Regional Energy Strategy 2030*. The document places strong emphasis on expanded local power generation, including both renewable energy sources and highly efficient combined heat and power (CHP) projects for large businesses and government facilities. Enhanced energy efficiency and energy conservation efforts, and modernization of the region's natural gas-fired power plants to reduce natural gas consumption, are also key elements of *San Diego Regional Energy Strategy 2030*.

Finding 3: A San Diego Energy Future Focused on Photovoltaics Is Cost-Competitive

In 2006, Governor Schwarzenegger signed into law Senate Bill 1, an amended version of the "million solar roofs" California Solar Initiative, to provide incentives for commercial PV applications up to one megawatt (MW) as well as residential systems. The amended California Solar Initiative will rely on \$3.35 billion in incentives to add 3,000 MW of rooftop PV in California by 2017. It is anticipated that approximately 300 MW of PV will be added in the San Diego area as a result of this solar legislation.

A core element of *San Diego Smart Energy 2020* is adding over 2,000 MW of PV locally by 2020. This ambitious solar program, the *San Diego Solar Initiative*, will use an incentive structure similar to that of the California Solar Initiative. Power generated from PV systems, when combined with sufficient solar incentives, current federal tax credits, and current accelerated depreciation, is less expensive than conventional power purchased directly from the utility. For example, the City of San Diego pays \$0.12 per kilowatt-hour (kWh) to a third party provider for the power generated by the 965 kilowatt PV array at the City's Alvarado Water Treatment Plant under a long-term power purchase agreement. In contrast, the City pays approximately \$0.17 per kWh to SDG&E for conventional purchased power.

The capital cost PV is expected to drop 40 percent by 2010 due to an increase in manufacturing capacity worldwide. SDG&E will install electronic "smart" electric meters throughout the San Diego area by 2011. PV systems generate power during the day when electricity prices are highest. These smart meters will precisely track when PV systems are sending power to the grid. This in turn will enable fair compensation for the high value electricity being produced, further enhancing the economics of PV power generation.

Finding 4: Current State Policies Do Not Provide Utilities with Incentives to Prioritize Energy Efficiency, Renewable Energy, and Distributed Generation

California utilities earn a fixed profit based on the value of the property the utility owns. Examples of such property are utility-owned power plants, transmission and distribution lines, and electric and gas meters. The more a utility invests in these types of infrastructure, the more money is earned.

However, in 2003, the California Public Utilities Commission (CPUC) and the California Energy Commission adopted the *Energy Action Plan* and its associated power generation priorities or “loading order.” The *Energy Action Plan* provides a roadmap for meeting California’s future energy needs. The top priority listed in the *Plan* is energy efficiency to minimize increases in electricity and natural gas demand. Demand response, or reducing electricity demand during periods of peak usage, is next, followed by renewable energy resources and clean natural gas-fired CHP projects. Conventional power plant resources are identified as the last generation priority, to be considered only after maximum development of energy efficiency, renewable energy, and distributed generation has been realized.

A major hurdle to implementing the *Energy Action Plan* is the traditional utility revenue system. This system does not provide California utilities with a financial incentive to invest in energy efficiency, renewable resources, or distributed generation. However, a September 2007 ruling by the CPUC established incentives and penalties to motivate the utilities to pursue energy efficiency more aggressively. This is an important first step toward adapting the utility revenue system to reflect the priorities of the loading order.

Finding 5: Quality of Life in San Diego Requires New Thinking for Energy Supply – San Diego Smart Energy 2020

The primary objective of the energy strategy described in this report is to achieve a 50 percent reduction in greenhouse gas emissions from power generation sources by 2020. *San Diego Smart Energy 2020* is designed to accelerate local, smart distributed generation, with an emphasis on energy efficiency, commercial PV systems, and CHP installations. Implementation of *Smart Energy 2020* will: 1) maximize greenhouse gas reduction, 2) enhance energy security by minimizing dependence on natural gas for power generation, and 3) greatly expand local clean peak generation capacity to minimize reliance on power imports during periods of high demand when competition for these power imports is greatest.

San Diego Smart Energy 2020 calls for the addition of 2,040 MW of rooftop solar, with an emphasis on large commercial installations. It also includes the addition of 700 MW of clean distributed generation from CHP sources. Under *Smart Energy 2020*, renewable energy resources will provide 50 percent of San Diego County’s energy demand in 2020. *Smart Energy 2020* is outlined in Table 1-1. *The San Diego Solar Initiative* is a cornerstone of the *Smart Energy 2020* strategy. The *Initiative* will be funded by a \$1.5 billion PV incentive budget. The 2,040 MW of PV capacity built under the *Initiative* will be equipped with sufficient battery storage to allow full use of this capacity during peak demand periods.

A more limited *San Diego Smart Energy 2020* with a reduced PV incentive budget of \$700 million is outlined in Table 1-2. Under current cost allocation policy, SDG&E customers will be charged only 10 percent, or approximately \$700 million, of the \$7 billion lifecycle cost of the proposed Sunrise Powerlink (SPL) transmission project. A \$700 million *San Diego Solar Initiative* will provide for 920 MW of PV capacity by 2020 equipped with sufficient battery storage for reliable peaking power duty. Under this more limited approach, renewable energy resources will provide 36 percent of San Diego County's energy demand in 2020.

San Diego Smart Energy 2020 increases local peak generation in 2020 by 2,670 MW beyond the level of new local peak generation achieved in SDG&E's long-term plan. The limited version of *Smart Energy 2020*, as outlined in Table 1-2, will increase local peak generation in 2020 by 1,550 MW beyond the new local peak generation achieved in the SDG&E plan. In comparison, the proposed SPL transmission line would add 1,000 MW of power import capability. The greatly increased amount of local peak power generation capacity installed under either *Smart Energy 2020* scenario will eliminate the need to build new transmission to provide reliability during periods of peak power demand.

New residential and commercial buildings would incorporate state-of-the-art green building principles and sufficient rooftop solar to address expected electric energy consumption under *San Diego Smart Energy 2020*. The objective is net zero energy consumption in new construction.

Recommendation: Implement *San Diego Smart Energy 2020*

Step 1: Realign SDG&E financial incentives to match *Energy Action Plan* priorities

Step 2: Achieve absolute reduction of 20 percent in annual energy consumption by 2020

Step 3: Achieve absolute reduction of 25 percent in peak demand by 2020

Step 4: Achieve 50 percent reduction in greenhouse gas emissions from power generation by 2020 through use of local PV and CHP distributed generation

Step 5: Prioritize modernization of the 1950s-vintage electrical distribution system to maximize potential benefits of smart grid

Step 6: Assure new construction in San Diego incorporates state-of-the-art green building principles and sufficient rooftop solar to meet own electricity demand

Each *San Diego Smart Energy 2020* scenario is compared side-by-side with the SDG&E 2016 strategic plan in Tables 1-1 and 1-2. The targets in Tables 1-1 and 1-2 are described in terms of annual electric energy usage and peak power demand. Annual energy usage is analogous to the total gallons of fuel used by an automobile over the course of a year. Peak power demand is analogous to the maximum horsepower required of the automobile when it is fully loaded and must maintain a high rate of speed while driving up a hill. Electricity planning in California is largely guided by peak power demand.

Table 1-1. Comparison of San Diego Smart Energy 2020 (\$1.5 billion incentives budget) and SDG&E Strategic Plan

		San Diego Smart Energy 2020 – \$1.5 Billion Solar Incentive Expenditure			SDG&E Strategic Plan – 2016 \$7 Billion Sunrise Powerlink Expenditure (\$700 million allocated to SDG&E customers)		
Element	Action	Demand/ supply (GWh-yr)	Electricity cost impact	Action	Demand/ supply (GWh-yr)	Electricity cost impact	
2003 baseline annual energy demand:		20,000			20,000		
1. Energy Efficiency (EE) /Demand Reduction (DR)	Reduce energy demand 20%, 4,000 GWh, compared to 2003 baseline of ~20,000 GWh thru EE. Maximize DR thru cooling system EE upgrades and "smart" meters to reduce peak 25% from 2007 peak of 4,636 MW to 3,500 MW.	(4,000)	neutral	Energy demand increases 4,679 GWh relative to 20,000 GWh baseline. Peak demand increases 560 MW to 5,060 MW from 4,500 MW baseline.	4,679	neutral	
2020 annual energy demand:		16,000		2016 SDG&E:	24,679		
2020 sources of energy supply – San Diego Smart Energy 2020:				2016 SDG&E sources of energy:			
2. Renewable Energy	a. SB 107 - 20% renewable energy by 2010. b. Million solar roofs – 300 MW by 2017. c. Supporting information for Tables 1-1 and 1-2:

- a) Definitions: Neutral cost impact – net effect of action will result in no expected increase to customer electricity rates relative to the utility rate basecase; Existing – operational source.
- b) All photovoltaic MW capacities are in alternating current - AC.
- c) Energy Action Plan uses 2003 as baseline to measure the 20% absolute reduction by 2015 in energy usage at state government and commercial buildings.
- d) California's three utilities, PG&E, SCE, and SDG&E, achieved a combined total of 6,200 GWh of energy efficiency savings through 2006. A May 2006 energy efficiency potential study prepared by Itron for California's three regulated utilities estimates that as much as 48,000 GWh of reduction is attainable in existing buildings statewide with cost-effective technologies. SDG&E represents about 10 percent of the California regulated utility load, or nearly 5,000 GWh of additional economic energy efficiency savings.
- e) SDG&E assumes smart meters will reduce peak demand by 5 percent. Industry analysts (Brattle Group) estimate smart meters could reduce peak demand by more than 20 percent. Five (5) percent is used as the default assumption to establish a peak demand reduction target of 25 percent (20 percent through energy efficiency - EE, 5 percent through smart meter efficiencies).
- f) SDG&E estimates energy demand in 2016 after employing EE measures at 24,679 GWh, and peak power demand in 2016 after employing EE measures at 5,060 MW.
- g) All power generation used to meet the SDG&E projected demand increase of 4,679 GWh in 2016 relative to the 2003 baseline is assumed to be met with combined-cycle generation.
- h) In order to achieve a 20% renewable generation mix by 2010 based on a 2009 forecast bundled customer retail sales benchmark of 17,418 GWh, SDG&E must obtain a total of approximately 3,484 GWh of renewable energy (8/4/06 application, p. III-9). SDG&E estimates 2015 bundled customer retail sales of 19,076 GWh. 20% of 19,076 GWh is 3,815 GWh.
- i) Assume SB1 "million solar roof" PV systems are not equipped with battery storage to operate as afternoon peaking units.
- j) *San Diego Solar Initiative* PV systems will be equipped with energy management/battery storage to operate as afternoon peaking units. The cost of energy management/battery storage is assumed to be 10 percent of the overall system cost.
- k) Estimate of growth of CHP under SDG&E 2016 case is from SANDAG Energy Working Group Policy Subcommittee recommendations on CHP dated Nov. 16, 2006.
- l) SDG&E estimates approximately 1,800 GWh generated from QF (large CHP) and CHP in 2016 (2007-2016 LTPP presented by SDG&E to SANDAG EWG, Jan. 25, 2007, p. 11 bar chart). SDG&E estimates installed QF + CHP capacity in 2015 of 390 MW. The production of 1,800 GWh-yr from 390 MW of capacity equals a capacity factor of 52 percent. CHP will have a primary baseload role in *San Diego Smart Energy 2020*. Average CHP capacity factor under *San Diego Smart Energy 2020* is assumed to be 80 to 85 percent.
- m) Explanation of "net" 500 GWh of power from combined-cycle and conventional gas-fired generation: The output of 1 or 2 combined-cycle plants will be needed routinely under the *San Diego Smart Energy 2020* plan at night and during cloudy days, when there is little solar power generation. CHP alone will not be able to meet the nighttime or cloudy day demand. However, on clear days there will be net outflow of power from the San Diego region to neighboring utility areas as the combined solar and CHP output will often exceed local demand in the middle of the day. There will be power flowing in and out of the San Diego area on a continuous basis. The overall effect of this flow from a greenhouse gas calculation standpoint will be 500 GWh of net greenhouse gas emissions from combined-cycle power generation.
- n) Nuclear power estimate in SDG&E 2016 case from SDG&E 2007-2016 Long-Term Procurement Plan, Vol. I, as shown in SDG&E presentation to SANDAG EWG, January 25, 2007, p. 11.
- o) Estimate of cost to upgrade north/south 230 kV transmission line and 500 kV east/west transmission line to add 550 MW of additional capacity from D. Marcus, June 1, 2007 testimony, in CPUC proceeding A.05-12-014, SDG&E Sunrise Powerlink 8/4/06 application.
- p) Estimate of cost of Sunrise Powerlink, \$1.265 billion capital cost and \$174 million per year for 40 years in 2010 levelized dollars, a total of \$6.96 billion, from SDG&E 8/4/06 application.
- q) Central heat & power CO₂ emission factor per SDG&E: 639 lb CO₂ per MWh.
- r) Combined-cycle CO₂ emission factor: 819 lb CO₂ per MWh (117 lb CO₂ per million Btu, 7 million Btu per MWh).
- s) All gas-fired power generation other than CHP is assumed to be combined-cycle generation for greenhouse gas emissions calculation purposes.
- t) A total of 14,729 GWh of combined cycle production is assumed for the SDG&E 2016 case (4,679 GWh of demand increase after EE + 10,050 GWh of conventional gas turbine CC power generation). The current combined-cycle capacity factor used by the CEC is 60%. A total of 1,100 MW of local combined-cycle capacity (542 MW Palomar and 561 MW Otay Mesa) will be online in 2016. The expected GWh of electricity production from these two plants in 2016 is projected to be 5,782 GWh at 60% capacity factor. Local generation represents approximately 40 percent of the 14,729 MW of combined-cycle production in 2016. The remaining combined-cycle power production in the SDG&E 2016 case, 8,947 GWh, is assumed to be imported.
- u) The CEC assigns a 7.5 percent greenhouse gas penalty to power imported over transmission lines from out-of-state. A factor of 1.075 is applied to the CO₂ emission calculation for the estimated 8,947 GWh of imported combined-cycle power in the SDG&E 2016 case to account for the greenhouse gas penalty assigned to transmission of energy supplies from out-of-state.
- v) New post-2007 generation available for peak demand periods: 1) *San Diego Smart Energy 2020* – 2,040 MW PV, 700 MW CHP, 150 MW CSI PV, 40 MW pumped hydroelectric, 133 MW gas-fired peaking turbines. SDG&E 2016 – 40 MW CHP, 150 MW CSI PV, 40 MW pumped hydro, 133 MW gas-fired peaking turbines (J-Power 86.5 MW and Wellhead Power 46.5 MW).
- w) The capital cost estimate for the 230 kV and 500 kV transmission upgrades included in *San Diego Smart Energy 2020* is \$135 million. The capital cost estimate for the Sunrise Powerlink is \$1.265 billion. The lifecycle cost (in 2010 dollars) of Sunrise is estimates at \$6.96 billion per SDG&E. The ratio of lifecycle cost to capital cost in the Sunrise case has been applied to the \$135 million capital cost estimate for the 230 kV and 500 kV transmission upgrades to calculate an estimated lifecycle cost of \$740 million.
- x) All GWh annual totals and estimated CO₂ annual emissions are based on the entire electrical demand in SDG&E service territory, including "direct access" customers. *San Diego Smart Energy 2020* assumes all customers in SDG&E service territory participate, including current direct access customers. SDG&E forecasts that direct access customers will represent 23 percent, 5,603 GWh of 24,679 GWh, of the total demand in SDG&E service territory in 2016.
- y) The natural gas used in the region that would be displaced by liquefied natural gas (LNG) is from Southwestern raw gas sources with very low (< 1%) CO₂ content in most cases. A few West Texas raw gas sources have significant levels of CO₂. However, this CO₂ is captured at the natural gas processing plant(s) and used in CO₂ enhanced oil recovery projects.
- z) SDG&E parent company Sempra Energy will begin operation of its LNG import terminal in Baja California in 2009. At that time Sempra will reverse flow on the SDG&E pipeline network to move natural gas from the LNG terminal north into SDG&E and SoCalGas pipeline systems. 100% of the natural gas in the SDG&E pipeline system will be from the LNG terminal from 2009 forward. Sempra intends to import the LNG from the BP liquefaction plant in Tangguh, Indonesia. The lifecycle CO₂ burden of LNG from Tangguh, including raw gas CO₂ content, liquefaction, shipping, and regasification, is approximately 25 percent greater than that of domestic natural gas from the Southwest. The CO₂ emissions generated under the "domestic natural gas" scenario are multiplied by 1.25 to determine the additional lifecycle CO₂ burden associated with the regional switch to natural gas derived from imported LNG.

2. Understanding the Policy Context for our Region’s Energy Future

2.1 California Energy Legislation

2.1.1 AB 32 – California Global Warming Solutions Act, 2006

In September 2006, Gov. Schwarzenegger signed into law Assembly Bill (AB) 32, which mandates that California reduce greenhouse gas (GHG) emissions to 2000 levels by 2010 (11 percent below business as usual), to 1990 levels by 2020 (25 percent below business as usual), and 80 percent below 1990 levels by 2050. AB 32 also requires the accounting of GHG emissions associated with transmission and distribution line losses from electricity generated within the state or imported from outside the state. The lead agency within state government tasked with developing the regulatory structure for the implementation of AB 32 is the California Air Resources Board.

2.1.2 SB 1078 – California Renewable Portfolio Standard, 2002

Senate Bill (SB) 1078 requires California’s investor-owned utilities, SDG&E, Southern California Edison (SCE), and Pacific Gas & Electric (PG&E) to procure 20 percent of their electric retail sales from eligible renewable resources by the year 2017. Eligible renewable resources include solar, wind, geothermal, and biomass. SB 1078 also requires retail sellers of electricity, including SDG&E, to increase their procurement of renewable energy by 1 percent per year.¹

2.1.3 SB 107 – 20 Percent Renewable Energy by 2010, 2006

SB 107 codifies the acceleration of California’s renewable energy portfolio standard to require that 20 percent of electric sales by retail sellers, except for municipal utilities, are procured from eligible renewable energy resources by 2010. In 2003, the CPUC accelerated the 20 percent renewable resource requirement to 2010. SB 107 codified the CPUC’s decision to advance the deadline. SB 107 requires municipal utilities to adopt their own renewable procurement programs and does not subject municipal utilities to a specific renewable resource target.

SDG&E estimates that it must purchase approximately 3,500 GWh of renewable energy in 2010 to meet the SB 107 mandate.² Neither the CPUC or SDG&E anticipate that new transmission is necessary to meet this renewable energy mandate.^{3,4}

2.1.4 SB1 – California Solar Initiative “Million Solar Roofs”, 2006

SB1, the Governor's Million Solar Roofs program, established the goal of 3,000 megawatts (MW) of new, solar-produced electricity by 2017. \$3.35 billion in PV incentives has been allocated to meet the 3,000 MW goal.⁵ The objective is to achieve a self-sustaining solar market by 2016. The program consists of three components:⁶

- The PUC's “California Solar Initiative” (CSI) provides \$2.165 billion in incentives over the next decade for existing residential homes and existing and new commercial, industrial, and agricultural properties. The CSI goal is 1,940 MW.⁷ The program is funded through revenues and collected from electric utility distribution rates.
- The California Energy Commission manages a 10-year, \$400 million program to encourage solar in new home construction through its New Solar Homes Partnership. The New Solar Homes Partnership goal is 360 MW.
- Local publicly-owned electric utilities, such as the Los Angeles Department of Water and Power and the Imperial Irrigation District, will adopt, implement, and finance a solar initiative program by January 2008. The estimated incentive budget is \$784 million. The publicly-owned utility goal is 700 MW.

PV system rebates given through CSI changed from capacity-based payments, scaled to the size of the PV system installed, to performance-based incentives that reward properly installed and maintained solar systems on January 1, 2007. The incentives are determined according to the system size, as follows:

- For PV systems greater than or equal to 100 kW in size, incentives will be paid monthly based on the actual energy produced for a period of five years. This incentive path is called Performance Based Incentives (PBI). Systems of any size may elect to opt into the PBI program. In addition, “building integrated” PV systems, regardless of size, are required to participate in the PBI program.
- PV electricity systems up to 5 MW capacity are eligible, although incentives are paid only for the first 1 MW of capacity.
- Incentives for all systems less than 100 kW are paid a one-time, up-front incentive based on expected system performance. Expected performance is calculated based on equipment ratings and installation factors, such as geographic location, tilt, orientation and shading. This type of incentive is called Expected Performance-Based Buydown. Residential and commercial incentives receive up to \$2.50 per watt, depending on their location, tilt, orientation, and other installation factors. Government and non-profit organizations receive a higher incentive (up to \$3.25 per watt) to compensate for their lack of access to the federal tax credit.

The incentive payment levels are automatically reduced over the duration of the CSI program in ten steps, based on the volume of MW of confirmed reservations issued within each utility service territory. On average, the CSI incentives are projected to decline at a rate of 7 percent each year following the start of implementation in 2007.

SB1 also raised the “net metering cap” to 2.5 percent of each utility’s peak demand.⁸ Net metering allows utility customers to self-generate PV electricity up to the amount of electricity the customer uses during the year. The utility does not pay the customer for any electricity produced beyond the customers own needs under the net metering format.

2.1.5 SB 1037 – California Energy Efficiency Act, 2005

The primacy of energy efficiency in the State’s energy strategy was reinforced with the passage of SB 1037 in September 2005. SB 1037 requires that both the state’s investor-owned utilities like SDG&E and locally-owned power providers help meet the state’s power needs through energy efficiency and demand reduction. These include energy efficient lights and appliances, and programs that emphasize using less energy or doing tasks at off-peak hours when energy is in less demand. SB 1037 also requires natural gas corporations to have similar policies in place. The law requires that investor-owned utilities (IOU), PG&E, SCE, and SDG&E, exhaust all feasible, cost effective energy efficiency potential in their service areas before pursuing any other energy resource options.

SB 1037 requires that an electrical corporation “meet its unmet resource needs through all available energy efficiency and demand reduction resources that are cost effective, reliable, and feasible.” Additionally, in “considering an application for a certificate for an electric transmission facility, the commission shall consider cost-effective alternatives to transmission facilities that meet the need for efficient, reliable, and affordable supply of electricity, including...energy efficiency.”

2.1.6 AB 117 - Community Choice Aggregation, 2002

AB 117 authorizes customers to aggregate their electrical loads as members of their local community with community choice aggregators (CCA). The bill authorizes a CCA to aggregate the electrical load of interested electricity consumers within its boundaries. AB 117 allows individual municipalities and counties to establish a CCA or join together to form a CCA for the purpose of purchasing power independent of the investor-owned utility serving the area. A CCA relies on the utility for electric transmission services only.

AB 117 requires a CCA to file an implementation plan with the CPUC in order for the PUC to determine a cost-recovery mechanism to be imposed on the CCA to prevent a shifting of costs to the utility’s remaining customers. AB 117 requires a retail customer electing to purchase power from a CCA to pay specified amounts for Department of Water Resources contracts and utility costs. This component of AB 117 refers to the 10-year power purchase contracts signed in 2001 during the California energy “crisis” that are administered by the Department of Water Resources.

AB 117 also states generally that it is an objective of the legislation to avoid shifting of recoverable costs between customers. This means that a utility like SDG&E can potentially assign an “exit fee” to customers that would like to form a CCA in the San Diego region. The exit fee can be assigned if the utility can demonstrate to the CPUC that those customers were

assumed to be a part of SDG&E's customer base when SDG&E received approval to ratebase a major new infrastructure investment like the 542 MW Palomar Energy Project in Escondido or the proposed SPL.

2.1.7 AB 1X – Large Commercial Electric Customers Protection Act, 2001

AB 1X was one of the responses to the chaos of the 2000-2001 California energy crisis. AB 1X authorized the Department of Water Resources to purchase power to meet the power needs of the state's IOUs. AB 1X also protects residential and small commercial utility customers from rate changes for typical levels of electricity consumption. AB 1X provides long-term protection, possibly through the year 2021, from rate increases for these customers.

2.1.8 AB 29X – Large Commercial Customers Must Use Time-Of-Use Meters, 2001

Many of the large commercial customers have been on time-of-use (TOU) meters for years. Over 23,000 advanced interval meters were installed for customers with greater than 200 kW of demand as a result of AB 29X. The legislation required that all meter recipients shift to TOU rates. As a result, much of the potential for peak load reduction from these large commercial customers has already been realized as they have adapted their operations to higher peak prices.

2.1.9 AB 1576 – Modernization of Coastal Boiler Plants, 2005

This legislation authorizes IOUs to enter into long-term power purchase agreements with owners of aging coastal boiler plants to provide the financial mechanism necessary to replace these plants with state-of-the-art, high efficiency combined-cycle plants. San Diego County has two aging coastal boiler plants, 946 MW Encina Power Plant in Carlsbad and 689 MW South Bay Power Plant in Chula Vista. NRG Energy owns the Encina plant. LS Power owns the South Bay plant. NRG Energy filed application with CEC on September 14, 2007 to build a 558 MW dry-cooled combined-cycle replacement plant at the Carlsbad plant site. LS Power filed application with CEC on June 30, 2006 to build a dry-cooled 620 MW combined-cycle replacement plant at the Chula Vista Plant site.

2.1.10 SB 2431 - Garamendi Principle: Transmission Loading Order, 1988

The Garamendi Principle describes the siting of new transmission lines as inherently controversial and establishes priorities in an effort to guide the development of transmission projects. The Garamendi Principle defines the first priority as upgrading existing transmission lines to avoid the need for new construction. The second priority is defined as constructing new transmission lines in existing transmission corridors to avoid creating new transmission corridors. The last option is the construction of new transmission lines in new corridors if 1)

upgrades to existing transmission lines can not provide the needed capacity, and 2) existing transmission corridors are unavailable.

The Garamendi Principle does not address or assign a priority to the replacement of existing transmission structures in state parks with much larger transmission structures having much greater transmission capacity. A map of the proposed route of the SPL through the Anza Borrego State Park, as well as a graphic comparing the size the existing 69 kV transmission poles in the park with the proposed 500 kV SPL towers, is provided in **Attachment A**.

2.2 CPUC and CEC Energy Policy

2.2.1 California State Energy Action Plan

California, through the CEC and the CPUC, has developed the “*Energy Action Plan*” to guide strategic energy decisionmaking. This plan establishes the energy resource “loading order” that defines how California’s energy needs are to be met. *Energy Action Plan I* was published in May 2003. *Energy Action Plan II* was adopted in September 2005.⁹ *Energy Action Plan II* describes the loading order as “the priority sequence for actions to address increasing energy needs” and then states (p. 2):

“The loading order identifies energy efficiency and demand response as the State’s preferred means of meeting growing energy needs. After cost-effective efficiency and demand response, we rely on renewable sources of power and distributed generation, such as combined heat and power applications. To the extent efficiency, demand response, renewable resources, and distributed generation are unable to satisfy increasing energy and capacity needs, we support clean and efficient fossil-fired generation.”

2.2.2 CPUC Policy Decisions

Cap on baseload power plant greenhouse gas (GHG) emissions at level of natural gas-fired combined cycle power plant (Decision 06-02-032): The CPUC adopted a cap on GHG emissions resulting from the generation of electricity used by California consumers on February 16, 2006.¹⁰ The Governor’s climate change emission reduction targets are now based in part on all long-term commitments to new electricity generation for use in California coming from sources with GHG emissions equal to or less than those emitted by a new combined cycle natural gas power plant.¹¹

Reduce forecasted peak demand by 5 percent from 2007 onward (Decision 03-06-032): The demand response programs described in this 2006 decision are designed to target the highest 80 to 100 hours of demand per year when energy costs are at their highest.

Employ energy efficiency measures to reduce forecasted annual energy consumption by 10 percent by 2013 (Decision 04-09-060). The objective of this policy is to reduce electric energy

consumption. SDG&E indicates that it is on a savings goal trajectory that is 118 percent of the cumulative maximum achievable energy efficiency potential.¹² However, in 2006 SDG&E achieved only 41 percent of its CPUC mandated energy savings goal for the year.¹³

Establishment of risk/reward mechanism to financially incentivize utilities to maximize investment in energy efficiency (Decision 07-09-043). The CPUC established a financial incentives framework with this September 20, 2007 decision that rewards utilities with up to 12 percent return on investment for exceeding energy efficiency targets and penalizes the utilities if they achieve less than 65 percent of the target. Utilities generate earnings for shareholders when they invest in “steel-in-the-ground” supply-side resources like power plants and transmission lines, but not when the utilities are successful in procuring cost-effective energy efficiency. This decision addresses this inherent utility bias toward supply-side solutions.¹⁴

SDG&E advanced metering infrastructure - “smart meters”: On April 12, 2007, the CPUC approved \$572 million for SDG&E's Advanced Metering Infrastructure (AMI) project. SDG&E's deployment of AMI is scheduled to begin in mid-2008. From 2008 through 2010, SDG&E will install approximately 1.4 million AMI electric meters and 900,000 AMI gas meters that will measure energy usage on a real-time basis. The intent of these meters is to: 1) improve customer service by assisting in gas leak and electric systems outage detection, 2) transforming the meter reading process, and 3) providing real near-term usage information to customers. AMI will be capable of supporting in-house messaging displays and smart thermostat controls, though these innovations are not part of the first phase of SDG&E's AMI project. The use of AMI meters is expected to reduce the peak demand in SDG&E service territory by approximately 5 percent, in the range of 200 MW, in 2011.

Direct Access: Direct Access was instituted as a part of deregulation of the California energy market. The intent was to allow retail competition. Approximately 20 percent of the power sales in SDG&E service territory are through direct access purchases.¹⁵ Direct access was indefinitely suspended as a result of the volatility in the California energy market in 2000-2001. California entered into long-term contracts to purchase power on behalf of the utilities in response to the energy crisis. At the time direct access was suspended, there was a fear that too many ratepayers would switch to direct access and that these departing customers would strand the costs of energy for the remaining ratepayers. Direct access was suspended to ensure that these long-term power contracts would be paid-off through bundled utility rates.

The long-term contracts are being paid down and the utilities are now authorized to purchase power from other providers. Many businesses, universities, and other commercial-scale entities are supportive of increasing customer choice options and reinstating direct access. A CPUC proceeding has begun that will consider reinstating direct access.

3. The Community Choice Aggregation Option

Two entities have formed CCAs since AB 117 was passed into law in 2002, the San Joaquin Valley Power Authority and the City of San Francisco.

The PUC authorized its first CCA application under AB 117 on April 30, 2007. The CCA application was submitted by the Kings River Conservation District (KRCD) on behalf of San Joaquin Valley Power Authority (SJVPA). The SJVPA will serve Clovis, Hanford, Lemoore, Corcoran, Reedley, Sanger, Selma, Parlier, Kingsburg, Dinuba and Kerman, and Kings County.

The introduction to the SJVPA implementation plan provides an excellent summary of the expected benefits of forming a CCA. The following paragraphs are excerpts from the implementation plan:

“The Authority’s primary objective in implementing this Program is to enable customers within its service area to take advantage of the opportunities granted by Assembly Bill 117 (AB 117), the Community Choice Aggregation Law. The benefits to consumers include the ability to reduce energy costs; stabilize electric rates; increase local electric generation reliability; influence which technologies are utilized to meet their electricity needs (including a potential increased utilization of renewable energy); ensure effective planning of sufficient resources and energy infrastructure to serve the Members’ residents and businesses; and improve the local/regional economy.

The Authority’s rate setting policies establish a goal of providing rates that are lower than the equivalent generation rates offered by the incumbent distribution utility (PG&E or SCE). The target rates are initially at a five percent discount with the discount potentially increasing once additional KRCD-owned resources are brought on-line.”

The San Francisco City Council voted to form a CCA on June 20, 2007. The mayor of San Francisco approved the city council action on July 2, 2007. A description of the San Francisco CCA implementation plan is provided in the following section.

3.1 Case Study: San Francisco CCA Implementation Plan

San Francisco's renewable energy target is 51 percent renewable energy by 2017. The city will use \$1.2 billion in municipal bond financing for construction over the first few years to implement its strategic energy plan.

The CCA will be implemented in two phases. The first phase will cover the first 3 to 4 years where 360 MW of combined resources will be put in place. This includes both energy supply and demand side resources, specifically:

- 107 MW energy efficiency/conservation - goal is to shift more emphasis to peak load reduction compared to current utility energy efficiency programs.
- 150 MW wind power generation.
- 31 MW of onsite PV - this target is embedded in a larger city goal of 50 MW of PV.
- 72 MW of other local distributed energy resources, preferably renewable.

The San Francisco CCA electricity portfolio will be publicly financed using municipal bonds. This significantly reduces the cost of money for building renewable power generation facilities

relative to the commercial loans available to private investor-owned utilities or private developers.

An important current element of the economic viability of renewable energy generation is the federal tax credit. The tax credits are intermittent and historically have disappeared from time-to-time. In the case of wind generation, the wind production tax credit only applicable during the first ten years of operation. After the first ten years the wind farm must be competitive on its own. CCAs are not eligible for these tax credits, as a CCA is a tax-exempt public entity. The CCA, using tax-free bonds, achieves the same or better net cost as the commercial renewable facility with its tax credit. However, CCA avoids the risk of tax credits being unavailable in any given year, and the low-cost financing benefit extends beyond the first ten years through the full financial lifecycle of the asset.

3.2 Comparison of San Francisco CCA and SDG&E Approaches to Renewable Energy

San Francisco will invest \$1.2 billion in low cost municipal bonds to achieve 51 percent renewable energy by 2017. By way of comparison, SDG&E estimates a capital budget of \$1.265 billion will be needed to construct the proposed SPL to import 1,000 MW of power into the San Diego area. SDG&E is currently subject to a 20 percent renewable energy requirement by 2010.

The California *Energy Action Plan* identifies 33 percent renewable energy by 2020 as a priority goal of Gov. Schwarzenegger. The passage of AB 32 in September 2006, which requires a 25 percent reduction in GHG emission levels compared to 1990 levels by 2020, has increased pressure to accelerate renewable energy development in the state. In April 2007, SDG&E/Sempra¹⁶ opposed state assembly legislation that would have required California's electric utilities to reach 33 percent renewable energy by 2020.¹⁷ This legislation was defeated in committee.

3.3 CCAs and Public Utilities: Low Cost Project Financing

SDG&E is an IOU. IOU's are for-profit regulated monopolies that are responsible to shareholders. The City of San Diego is served by SDG&E and represents approximately half of SDG&E's customer base. This makes San Diego relatively unique among larger cities in California.

A breakdown of the electricity provider structure in California's seven largest cities is provided in Table 3-1. The City of Los Angeles has its own public utility, the Los Angeles Department of Water and Power (LADWP). Public utilities are non-profit entities responsible to the political leadership of the city or geographic area served by that public utility. For example, the board of directors of the LADWP is appointed by the mayor of Los Angeles. Sacramento has its own public utility, the Sacramento Municipal Utility District (SMUD).

Table 3-1. Electricity Provider Structure in California's Seven Largest Cities

City (ranked by population)	Electricity Provider Type	Name	Access to low-cost municipal bonds to finance energy projects?	Renewable energy target
Los Angeles	public utility	LADWP	yes	35% by 2020
San Diego	IOU	SDG&E	no	20% by 2010
San Jose	IOU	PG&E	no	20% by 2010
San Francisco	CCA	SF CCA	yes	51% by 2017
Long Beach ¹⁸	IOU	SCE	no	20% by 2010
Fresno	IOU	PG&E	no	20% by 2010
Sacramento	public utility	SMUD	yes	23% by 2011

San Francisco is now a CCA. CCA's are in many respects similar to public utilities. However, the CCAs rely on the IOUs serving the area to provide transmission service to customers within the CCA. The IOUs provided both electricity and transmission service to these same CCA customers prior to the formation of the CCA, and continue to provide only transmission service following formation of the CCA.

A private or "merchant" developer would need a 15 percent or more rate of annual profit and would pay 7 percent or more annual interest on any borrowed money. The electric generation plant is primarily built with borrowed money and to a lesser degree with direct investments. A facility built with this financing approach must return at least 10 percent of its value every year in combined interest on loans and investor profits. Over 20 years, a merchant plant would be paid for three times over - once to build it and twice more in the form of interest on loans and profits.¹⁹

The publicly-owned plants are the least expensive due to low financing costs and freedom from taxes. The IOU power plants are currently less expensive than merchant facilities due to lower financing costs. This is in marked contrast to 2003, the when merchant financing costs were at least comparable to those for the IOUs. The change is a reflection of the outcome of the 2000-2001 energy crisis.²⁰

One major advantage of public utilities and CCAs is access to low-cost financing. The only cost associated with low-cost municipal bonds available to public utilities and CCAs is the interest on the bond. Municipal bonds have very low interest payments, under 5 percent, as they are issued free of federal tax. Public utility and CCA energy facilities are publicly-owned assets, and for that reason do not need to return a profit. Two costs that private developers must contend with are absent. Over a 20-year period the public energy facility is paid for only twice - once to build it and again to pay the interest on the bond.²¹

The form of financing has a big impact on renewable energy facilities, as most of the cost of these facilities is upfront capital cost. These upfront capital costs carry the burden of having to return interest and profits. This is in contrast to a natural gas-fired plant where 50 percent to 80 percent of the lifecycle cost is fuel, and this fuel is purchased near the time the fuel is needed.²² Municipal bonds level the playing field for renewable energy facilities, and can make renewable energy facilities competitive in a CCA or public utility structure that would not be competitive for an IOU or private investor.

The CEC recently prepared levelized “cost of power generation” estimates for various central station generation technologies. These levelized costs are useful in evaluating the financial feasibility of a generation technology and for comparing the cost of one technology against another over a 20-year lifecycle. Costs are reported in dollars per megawatt-hour (\$/MWh). The \$/MWh figure is useful as it allocates costs to the expected hours of operation. Costs vary depending on whether the project is a merchant facility, IOU, or a publicly-owned utility (or a CCA).²³

Table 3-2 highlights the power project financing advantage of public utilities and CCAs relative to IOUs and merchant (private) developers. For example, the cost of power production from concentrating PV built by a CCA is estimated at \$116/MWh. The same project built by a merchant developer has an estimated lifecycle power production cost of \$272/MWh.

Table 3-2 also highlights the cost-effectiveness of some renewable energy technologies relative to natural gas-fired combined cycle baseload power plants and simple cycle “peaking” gas turbine power plants. Geothermal and wind power plants are at least as cost-effective as combined cycle power plants on a lifecycle basis. An interesting result of the CEC cost comparison is how cost-effective concentrating PV is relative to simple cycle peaking turbines. Concentrating PV tracks the sun and has an afternoon power production profile that closely follows the late afternoon peak power demand load profile. This makes concentrating PV a direct option to simple cycle peaking turbines. The reason for the superior cost performance of concentrating PV is the fact that in addition to providing peak power during the 100 to 200 hours per year that peaking turbines are typically in operation, concentrating PV provides power at or near its rated capacity whenever the sun is shining.

Large commercial flat plate PV installations are also cost-competitive with simple cycle peaking turbines, assuming current levels of solar incentives and tax credits are available. The addition of sufficient battery storage for flat plate PV to maintain rated capacity through the afternoon peak demand period adds approximately 10 percent to the cost of the PV installation.²⁴ As shown in Table 3-2, flat plate PV equipped with adequate battery storage to operate effectively as a peaking power plant is cost-competitive with simple cycle peaking turbines even with a 10 percent premium for the battery storage.

Table 3-2. Summary of Levelized Cost of Competing Power Generation Technologies²⁵

Year 2007	Size (MW)	Merchant (\$/MWh)	IOU (\$/MWh)	Public Utility or CCA (\$/MWh)
combined-cycle	500	101	94	88
simple cycle	100	586	460	313
small simple cycle	50	633	499	346
geothermal – dual flash	50	89	65	67
concentrating PV	15	272	186	116
parabolic trough	63.5	295	219	155
flat plate PV	1	608	396	256
wind – class 5	50	99	67	61

assumed 2007 natural gas price: \$8.34/MMBtu

4. Current State Policies Do Not Incentivize Utilities to Prioritize Investments in Conservation, Renewable Energy, and Distributed Generation

An IOU earns a fixed profit based on the value of the property the IOU owns. Examples of such property are IOU-owned power plants, transmission and distribution lines, and IOU-owned electric and gas meters. In other words, the more an IOU invests in such projects, the more money it earns. When the CPUC, the CEC and the Legislature adopted the *Energy Action Plan* and its associated loading order in 2003, no changes were made to the CPUC's existing ratebasing policies. As a result, the IOUs do not currently have an economic incentive to support the loading order.^{26,27}

The CPUC's ratebasing policies have evolved over the last 100 years. The primary type of proceeding where ratebasing policies are addressed is the general rate-setting case. The regulated utility model, used in California up until the 1996 restructuring experiment, called for IOUs to invest shareholder funds in capital projects and to be allowed to recover those costs in rates charged to the ratepayers, along with a rate-of-return (profit) set by the CPUC.

The tendency of the traditional ratemaking formula to encourage overinvestment in utility capital projects is well known. Until 1981, California IOUs were focused on building revenues by convincing customers to use more of their product, as these IOUs had more capacity than needed to serve customer load. The IOUs spent money on marketing to get customers to use more gas and electricity. This included promoting all-electric "gold medallion" homes to increase electric demand, and promotions with rebates and discounts to get customers to buy more gas and electric appliances.

The CPUC decoupled IOU energy sales from its revenues for the first time in SDG&E's 1981 rate case decision.²⁸ The CPUC created a balancing account that allowed SDG&E to increase its authorized rate-of-return even if its overall gas and electric sales dropped due to conservation efforts. In that same decision, the CPUC authorized SDG&E to spend ratepayer money to create a low income weatherization program. This was the first ratepayer-funded conservation program of its kind that paid for the installation of conservation measures in customer's homes. The 1981 decision ordered SDG&E to initiate the new weatherization program quickly. The decision included an overall corporate rate-of-return penalty for non-compliance.

SDG&E increased its residential conservation programs from 1982 onward. The other IOUs in the state also adopted similar programs, starting with their low-income weatherization programs. By 1985 those programs had been expanded to serve commercial and industrial customers as well. The price of oil dropped to approximately \$10 to \$15 per barrel around 1985, and stayed at that price level for the next several years. Most of the IOU's conservation programs were dropped or severely cut back during this time period.

A state senate bill mandating that all IOUs provide ratepayer-funded energy conservation was passed in 1989. In response the CPUC convened a proceeding in which it adopted IOU shareholder penalties and rewards based on each IOU's energy conservation program

performance. The IOUs set their own goals and the CPUC approved the proposed budget. If the utilities met the goals, they were allowed to recover their program costs in rates. If they failed to meet the goals, they were forced to absorb a portion of those costs. If they significantly exceeded their annual goals, their shareholders were allowed to collect and keep a share of the avoided costs associated with the energy they saved.

California deregulated its energy market with legislation passed in 1996. Prior to deregulation, the IOUs presumed they were going to be forced to divest their power plants and become transmission and pipeline companies only. The CPUC gave indications that ratepayer-funded conservation programs might be dropped and the free market would determine how much, if any, conservation got done by customers. The IOUs began to downsize their conservation departments. In some cases the IOU parent companies started separate unregulated energy service companies. For example, Sempra Energy, parent company of SDG&E, started Sempra Energy Solutions.

In 2002, the CPUC eliminated the IOU conservation penalty/reward mechanism on the basis that the CPUC could simply order the IOUs to pursue conservation. However, the elimination of the penalty/reward mechanism also eliminated penalties for non-compliance. The CPUC reinstated the penalty/reward mechanism for energy efficiency programs in a September 20, 2007 decision.²⁹

The CPUC returned ratepayer-funded energy conservation program management responsibilities to the IOUs in 2003. Soon after that, the CPUC also returned long-term resource planning to the IOUs. That put the IOUs back in charge of regional energy resource planning. Today, the IOUs are focused primarily on expanding their CPUC-approved projects that allow full cost recovery through rates charged to customers. An example is Sempra's recent announcement that it plans to invest \$8 billion in its subsidiaries, primarily in SDG&E and Southern California Gas Company, for ratebased projects.³⁰ One of the projects identified in the Sempra announcement is the proposed SPL transmission project.

4.1 SDG&E and Sempra Energy

4.1.1 Sempra Energy – Regional Energy Infrastructure Assets

SDG&E parent company Sempra Energy is an active developer and operator of energy infrastructure projects in and around SDG&E service territory. Sempra owns natural gas-fired power plants in Mexicali, Mexico (600 MW), western Arizona (1,250 MW), Boulder City, Nevada (480 MW), and Kern County, California (550 MW). Sempra built the 542 MW Palomar Energy Project in Escondido and later sold the project to SDG&E in 2005. Sempra is also constructing a liquefied natural gas (LNG) receiving terminal in Baja California approximately 50 miles south of the U.S. border. The company has indicated to the CPUC and the CEC that it intends to reverse flow on the SDG&E natural gas pipeline system when the LNG terminal is operational so that natural gas from this facility can be delivered to customers in SDG&E and Southern California Gas Company service territories. As noted, Sempra also owns the Southern California Gas Company.

Sempra owns the entire natural gas pipeline network in Baja California and one 600 MW export power plant in Mexicali. The Sempra plant in Mexicali is connected by two 230 kV transmission lines with a capacity of up to 1,400 MW to the Imperial Valley substation in California.³¹ This plant is not physically connected to the Mexican power grid. The Imperial Valley substation is the starting point of SDG&E's proposed SPL.

The Mexican electricity monopoly, Comisión Federal de Electricidad, indicated the addition of a second Sempra plant in Mexicali in its description of the 2003-2007 transmission expansion plan for Baja California.³² While the second Sempra plant has not yet been permitted or constructed, it is foreseeable that with the existence of the proposed SPL transmission project, Sempra will have a compelling economic incentive to build the second export plant.³³

The SPL is potentially important to the future energy infrastructure development strategy of Sempra Energy in Baja California, especially if the transmission line ultimately interconnects with the Southern California Edison grid in the Los Angeles area. The Los Angeles area is by far the largest power market in the western U.S. SDG&E has made clear it intends to interconnect the SPL with the Los Angeles area.³⁴ Maps showing Sempra's pipeline infrastructure in Baja California, existing and proposed export power plants in Mexicali, and the projected pathway of the SPL to the Los Angeles area are provided in **Attachment B**.

4.1.2 Impact of Liquefied Natural Gas Imports on Regional Greenhouse Gas Reduction Efforts

SDG&E is currently projecting a 20 percent reduction in greenhouse gas emissions over the next decade, principally as a result of meeting the state mandate of 20 percent renewable energy generation by 2010.³⁵ However, this projection does not account for the greenhouse gas burden of converting from domestic natural gas to imported liquefied natural gas.

Parent company Sempra Energy will be shipping liquefied natural gas north through SDG&E's pipeline system from its Baja California liquefied natural gas terminal in 2009.^{36, 37} The greenhouse gas burden of liquefied natural gas is approximately 25 percent greater than that of the domestic natural gas SDG&E is currently using.³⁸ This extra burden is the result of the high levels of CO₂ in the raw gas that will be vented to atmosphere at the gas processing plant,³⁹ additional energy necessary to liquefy the natural gas, tanker transport across the Pacific, and regasification in Baja California. The net effect of the switch to imported liquefied natural gas in 2009 will be to nullify the 20 percent greenhouse gas reduction by 2016 projected by SDG&E in its current long-term plan. The significance of the switch to liquefied natural gas is explained in more detail in **Attachment C**.

4.2 Reality of Deregulated Energy Market Model

A driving force behind the vision of deregulated energy markets has been the presumption of the need to build transmission "superhighways" across the country to allow consumers to enjoy the benefits of the lowest cost energy available regardless of the physical point of generation. The

California Independent System Operator (CAISO) was created in 1996 to assure the proper functioning of this deregulated market system in California. CAISO is also the representative of the Federal Energy Regulatory Commission in the state. A central role of CAISO is to ensure adequate transmission capacity to allow a deregulated power market to function with minimum physical transmission constraints. However, recent Department of Energy data indicates the cost of power in states that embraced deregulation has risen faster than in states that retained traditional rate regulation.⁴⁰

The concept of eliminating transmission barriers to seeking out the lowest price electricity provider anywhere in the region or country may be obsolete in an environment that now puts a high value on energy security and greenhouse gas reduction. A power plant located in San Diego is inherently more physically reliable than the same plant located hundreds of miles away in Baja California or Arizona or New Mexico. The current high cost of natural gas results in aging and high polluting coal-fired power plants being the lowest-cost electricity providers in the U.S. Yet California's utilities are now prohibited from entering into long-term baseload contracts with power plants that have a greenhouse gas emissions footprint greater than that of a natural gas-fired combined cycle power plant. Coal-fired power plants have a significantly higher greenhouse gas emissions footprint than natural gas-fired combined cycle power plants.

AB 32 also specifically required accounting for the greenhouse gas emissions associated with transmission losses. The transmission loss assumption for the importation of out-of-state power to California is 7.5 percent.⁴¹ The justification for building transmission superhighways under deregulation, obtaining the cheapest electricity wherever it can be found, has been tempered legislatively by the twin objectives of greenhouse gas reduction and energy security.

5. Decoupling Utility Profits from Energy Sales in California⁴²

The CPUC adopted an “electric rate adjustment mechanism” for the state’s three utilities in the early 1980s. The mechanism sought to ensure that a utility could collect the amount of money needed to recover its fixed costs, to counter the effect of conservation programs reducing revenues.

In 1990, the CPUC supplemented this mechanism with a system of performance-based financial incentives for utilities to promote additional cost-effective energy savings. In 1996, as part of its legislation restructuring the electric industry, the state required all customers to pay a charge to fund conservation and renewable energy programs.

The CPUC suspended the “electric rate adjustment mechanism” and the financial incentives following adoption of the restructuring legislation. However, the CPUC adopted a decoupling mechanism for a natural gas utility, Southern California Gas Company, in 1998. The mechanism compensates the company for its costs on a per-customer basis with a set margin per customer, regardless of change in the total amount of natural gas that the company sells. This mechanism provides an incentive for the utility to increase the efficiency of its service delivery per customer.

The California *Energy Action Plan* requires the utilities to first use conservation and demand response measures to minimize increases in electricity and natural gas demand. Next, they must invest in renewable resources and distributed generation. Finally, they can use conventional resources to meet remaining needs. However, the current revenue system does not provide California utilities with a financial incentive to invest in conservation or renewable resources.

The CPUC issued a final decision on September 20, 2007 that rewards the utilities for meeting energy efficiency goals and penalizes the utilities for failure to do so.⁴³ This decision represents an important step in aligning electric utility financial incentives with the *Energy Action Plan* loading order.

6. San Diego County Energy Profile

6.1 Current Power Generation Sources

The San Diego area currently has approximately 2,200 MW of baseload natural gas-fired power generation capacity. This capacity includes the 540 MW Palomar Energy Project in Escondido, 946 MW Encina Power Plant in Carlsbad, and 689 MW South Bay Power Plant in Chula Vista. Additional baseload capacity includes approximately 200 MW of large cogeneration plants and 150 MW smaller combined heat and power plants. There are approximately 550 MW of peaking gas turbines in the region. SDG&E also receives 450 MW from the San Onofre Nuclear Power Plant located at the northern edge of Marine Corps Base Camp Pendleton. The 560 MW Otay Mesa combined-cycle plant is expected to be in operation by 2009.^{44,45} San Diego County power generation sources are listed in Table 6-1.

Not all power sold by SDG&E is generated in San Diego County. The percentage of energy imported by SDG&E is also provided in Table 6-1. In 2007 approximately two-thirds of the energy used by SDG&E customers is classified as imported energy by SDG&E.⁴⁶ SDG&E imports power under long-term power contracts signed in the wake of the 2000-2001 energy crisis and administered by the Department of Water Resources. Most of the contract expiration dates are in the 2010 to 2012 timeframe.⁴⁷ The company also imports power from sources outside the region, including coal power from neighboring western states.

In 2007 approximately 6 percent of the electric energy by SDG&E, around 1,000 GWh, will be from renewable energy sources.⁴⁸ Most of this renewable energy is generated outside of San Diego County. SDG&E is required by SB 107 to generate 20 percent of its retail sales from renewable energy sources by 2010. The major new renewable energy projects that SDG&E is currently proposing are outside of San Diego County. These projects include the 205 MW Pacific Wind project in the Tehacaphi area and the 300 MW Stirling solar dish project in Imperial County.⁴⁹ The Pacific Wind project will account for 3.4 percent of the 20 percent target. The Stirling project will account for 2.5 percent of the target.

The reason the solar project produces less energy on an annual basis than the wind project, while having a higher MW design capacity, is because the solar project will not produce energy at the same rate as the wind project. The capacity factor of the solar project, at approximately 0.2, will be lower than that of the wind project at approximately 0.3.⁵⁰

Table 6-1. San Diego County Power Generation Sources and Power Imported by SDG&E

Source	Capacity (MW)	Status	Fuel	Operating Pattern
A. San Diego County generation resources:^a				
Palomar Energy gas turbine combined cycle ^b	542	operational	NG	baseload
Otay Mesa gas turbine combined cycle	561	2009	NG	baseload
San Onofre nuclear plant ^c	449	operational	nuclear	baseload
Large cogeneration – QF ^d	233	operational	NG	baseload
Small combined heat and power (CHP)	120	operational	NG	baseload
Encina Power Plant – five boilers ^e	946	operational	NG	load following and peaking power
South Bay Power Plant – four boilers ^f	689	operational	NG	load following and peaking power
Simple-cycle gas turbines, pre-2000 [14 total, 1970s vintage]	200	operational	NG	peaking power
Simple-cycle gas turbines, post-2000 [8 total - Calpeak units (3) on DWR contract]	342	operational	NG	peaking power
Simple-cycle gas turbines, proposed [J-Power 86.5 MW, Wellhead Power 46.5 MW]	133	2008	NG	peaking power
Wind – Crestwood/Kumeyaay project	50	operational	none	intermittent
Solar – rooftop photovoltaic (PV)	38	operational	none	sunny days
Landfill gas + WWT digester gas	19	operational	methane	baseload
Bullmoose biomass project	20	2009	biomass	baseload
Hydroelectric – pumped storage [Lake Olivenhain – Lake Hodges]	40	2008	none	peaking power
Small hydroelectric	2	operational	none	baseload
B. SDG&E projected power imports as percent of forecast 2007 retail power sales:^g				
Natural gas – DWR long-term contracts ^h	22 percent			
Coal	12 percent			
Nuclear ⁱ	20 percent			
Large hydroelectric	9 percent			
Renewable energy ^j	4 percent			
Import percentage, 2007 SDG&E sales:	67 percent			
Notes:				
a) Sources of in-county data are: SDG&E 2007-2016 Long-Term Procurement Plan (LTPP), Exhibits, Exhibits IV-6 (2007 year) and IV-10; Aug. 4, 2006 SPL CPCN application, p. III-17, Table III-1 (list of renewable resources); proposed peaker gas turbine estimate from SDG&E May 14, 2007 press release – “SDG&E selects projects to meet peak-power demand in 2008”; PV estimate from 2 nd quarter 2007 SDG&E quarterly compliance filing with CEC on PV interconnection; CHP estimate from SANDAG EWG, <i>Policy Subcommittee Recommendations for Energy Working Group (EWG) Legislative Efforts</i> , November 16, 2006.				
b) SDG&E filed a petition with the CEC on July 27, 2007 to add a centralized chiller to cool the inlet air to the two combustion turbines at Palomar Energy. The modification will provide up to 40 MW of additional capacity to meet summer peak loads.				
c) SDG&E has 20 percent ownership of the 2,254 MW San Onofre nuclear plant. SCE has 75% ownership of the plant.				
d) The 55 MW cogeneration plant in Yuma, Arizona under QF contract with SDG&E is included in the 233 MW total.				
e) Owner NRG Energy filed application with CEC on September 14, 2007 to build 558 MW combined-cycle replacement plant.				
f) Owner LS Power filed application with CEC on June 30, 2006 to build 620 MW combined-cycle replacement plant. SDG&E assumes that South Bay will be permanently shut down in 2009 its Aug. 4, 2006 application to the CPUC for Sunrise Powerlink.				
g) Sources of imported power data are: August 2007 SDG&E “power content label” utility bill insert; SDG&E Jan. 25, 2007 PowerPoint presentation to SANDAG EWG on 2007-2016 LTPP (p. 11, graphic showing DWR contracts at 22% of sales - 2007).				
h) SDG&E was assigned the Williams A, B, and C, Sunrise Power Company (Kern County), and CalPeak long-term power contracts by the Department of Water Resources (DWR) as part of the resolution of the California 2000-2001 power crisis.				
i) Although San Onofre nuclear plant is located in San Diego County, SDG&E classifies power supplied by the plant as imports.				
j) SDG&E forecasts renewable energy resources will supply 6% of total sales in 2007. In-county renewable energy sources are estimated to provide approximately 2% of total sales. Approximately 2/3 of the renewable energy, 4% of sales, will be imported.				

6.2 Electric Energy Consumption and Peak Power Demand Trends

Electric power demand is measured in two ways for resource planning purposes: 1) total electric energy usage over the course of a year, and 2) peak power demand during hot summertime conditions. Annual energy usage is analogous to the total gallons of fuel used by an automobile over the course of a year. Peak power demand is analogous to the maximum horsepower required of the automobile when it is fully loaded and must maintain a high rate of speed while driving up a hill. Electricity planning in California is largely guided by peak power demand.

The residential electricity consumption in SDG&E service territory is approximately 8,000 “gigawatt-hours” (GWh) per year. Commercial and industrial electricity consumption adds another 12,000 GWh per year of demand, for a total annual demand in the range of 20,000 GWh per year.

The use of GWh as the unit of measure of annual energy usage is done for convenience. For example, a typical residence in the San Diego area consumes about 0.8 kilowatt of electricity on average.⁵¹ There are 8,760 hours in a year. SDG&E serves 1.2 million residences. Therefore residences in SDG&E service territory consume about 8,000 million kilowatt-hours (kWh) in a year. This is an unwieldy number. For that reason it is more common to speak in energy units of GWh. One GWh equals one million kWh.

Peak power demand is measured in megawatts (MW). One MW equal one thousand kW.

Table 6-2 shows the current trend in annual and hourly energy consumption in SDG&E service territory. The 2004 electricity consumption data is based on reported information. The 2007 and 2016 electricity consumption values are forecasts prepared by SDG&E. The 2016 forecast assumes a demand growth rate of more than 1.5 percent per year in the 2010-2016 timeframe for energy usage and peak power demand.

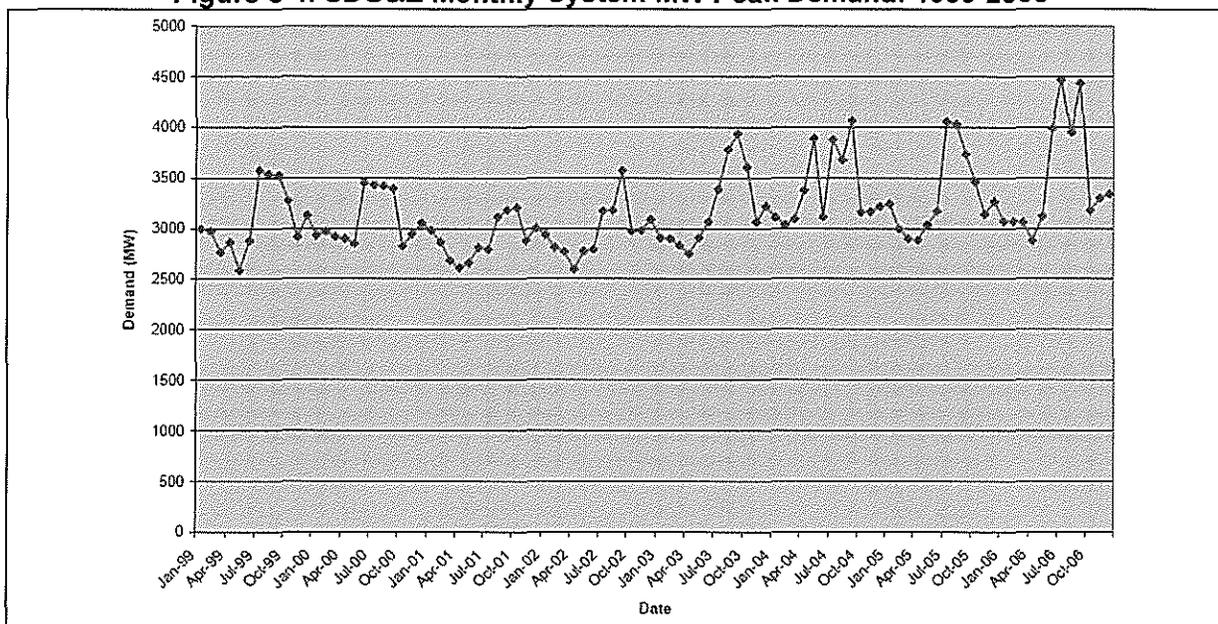

Table 6-2. Trends in Annual and Hourly Consumption

	2004 ⁵²	2007 ⁵³	2016 ⁵⁴
Annual energy usage in SDG&E service territory, GWh per year	20,578	21,721	24,679
Average hourly usage in SDG&E service territory, MWh	2,349	2,480	2,817

Peak power demand in SDG&E service territory in 2007 reached 4,636 MW.⁵⁵ This is nearly twice the average demand level on an annual basis. Peak demand is primarily associated with heavy usage of air conditioning systems on hot summer afternoons. The peak demand trend over the 1999-2006 period is shown in Figure 6-1. Adequate electric power generation capacity must be maintained to provide power even on the hottest day of the year to avoid power curtailments. For this reason, a large number of gas turbine power generators are located in the region to provide extra power for as little as 100 hours a year to address this peak demand. These units are

idle 98 to 99 percent of the time. This is an expensive and inefficient way to address peak power demand.

Figure 6-1. SDG&E Monthly System MW Peak Demand: 1999-2006⁵⁶

6.3 SDG&E Population Growth Forecast and Actual Growth Trend

SDG&E projects a growth in peak electricity demand of just over 60 MW per year in the 2007-2016 timeframe.⁵⁷ A major factor contributing to this growth in peak demand that is forecast by SDG&E by 2015 is the assumption of robust population growth. SDG&E uses a private proprietary population forecast service, Moody’s “[economy.com](#),” to project load growth.⁵⁸ SANDAG relies on U.S. Census Bureau statistics for its regional population forecasts. Powers Engineering purchased the San Diego County population growth forecast from [economy.com](#) to cross-check the data used by SDG&E with U.S. Census Bureau data. The [economy.com](#) population data is provided in **Attachment D**.

The population growth assumed by SDG&E in calculating electricity demand increases over the 2006-2015 time period is much higher than the actual 2000-2006 population growth trend for San Diego. SDG&E assumes a steady population increase of 1.1 percent per year over the coming decade.⁵⁹ U.S. Census statistics for San Diego County show an average population growth rate from 2000 to 2006 of 0.7 percent per year, and a July 1, 2005 to July 1, 2006 growth rate of less than 0.2 percent.^{60,61} U.S. Census statistics show San Diego County growing at a much slower rate than California as a whole from April 1, 2000 through July 1, 2006, 4.5 percent growth versus 7.6 percent statewide.⁶²

SDG&E derived the energy and peak demand forecasts used in the 2007-2016 Long-Term Procurement Plan from the CEC’s June 2006 updated demand forecast. The CEC data is statewide. As noted, the San Diego County growth rate is much lower than the statewide growth

rate. Use of CEC statewide data will result in a significant overestimate of the energy and peak demand for San Diego County.

U.S. Census forecasts California increasing its population by 12.4 percent in the 2000 – 2009 period.⁶³ At its current rate of growth, San Diego County will not achieve a growth rate even one-half the rate that the U.S. Census projects for California for the period 2000 through 2009. Census projects a slower population growth rate for California in the 2010-2019 period, averaging 1.0 percent per year during the period. Yet the economy.com data used by SDG&E forecasts an average San Diego County population growth rate of 1.55 percent per year for the 2010-2019 period, 50 percent higher than the U.S. Census forecast for California as a whole and more than double the San Diego County growth for the 2000-2009 period of 0.7 percent per year provided in the same economy.com forecast database.⁶⁴

One historically unique factor that makes it unlikely that San Diego County will approach the high population growth rates assumed by SDG&E in projecting electric power demand over the next decade is the extraordinarily high cost of housing. It is highly unlikely that this unprecedented disparity between the average price of a home, approximately \$550,000,⁶⁵ and the typical income level of San Diego County residents will rectify itself over the next ten years. In San Diego County, only 9 percent of the workers earn more than \$75,000 per year. Thirty (30) percent earn between \$35,000 and \$75,000 per year, and 61 percent earn less than \$35,000 per year.⁶⁶ It is highly speculative to forecast a major new influx of residents to the county unless a major reduction in the cost of housing is also being forecast.

7. Recent Strategic Energy Plans for the San Diego Region

7.1 San Diego Regional Energy Strategy 2030

The *San Diego Regional Energy Strategy 2030* (RES 2030) was prepared for SANDAG in the spring of 2003.⁶⁷ Many of the principal San Diego area government, industry, and public interest stakeholders were involved in the process of developing the document. SANDAG is the San Diego County regional planning agency. The SANDAG Board of Directors is composed of the mayors of all the incorporated cities in San Diego County, as well as a representative from the San Diego County Board of Supervisors. *RES 2030* was adopted by the SANDAG Board of Directors on July 25, 2003. The goals defined in *RES 2030* are described in Table 7-1.

Table 7-1. Goals of San Diego Renewable Energy Strategy 2030

RES Goal	Goal Description
1	Achieve and represent regional consensus on energy issues at the state and federal levels.
2	Achieve and maintain capacity to generate 65% of summer peak demand with in-county generation by 2010 and 75% by 2020.
3a	Increase the total electricity supply from renewable resources to 15% by 2010 (~740 MW), 25% by 2020 (~1,520 MW) and 40% by 2030 (~2,965 MW).

3b	Of these renewable resources, achieve 50% of total renewable resources from resources located within the County (~370 MW by 2010, ~760 MW by 2020, and ~1,483 MW by 2030).
4	Increase the total contribution of clean distributed generation resources (nonrenewable) to 12% of peak demand by 2010 (~590 MW), 18% by 2020 (~1,100 MW) and 30% (~2,225 MW) by 2030.
5	Increase the transmission system capacity as necessary to maintain required reliability and to promote better access to renewable resources and low-cost supply.
6	Reduce per capita electricity peak demand and per capita electricity consumption back to 1980 levels.
7	Develop policies to insure an adequate, secure and reasonably priced supply of natural gas to the region.
8	Reduce regional natural gas per capita consumption by the following targets: 5% by 2010, 10% by 2020, 15% by 2030.
9	Complete a transportation energy study by June 2004 to evaluate the potential savings through more efficient use of transportation technology and fuels.

The goal of achieving 1980 levels of per capita electricity peak demand and per capita electricity consumption by 2030 represents a 15 percent reduction from the 2002 baseline year. *RES 2030* provides a sketch of how the per capita reduction in electricity usage will be achieved:

“The evolution of technology is such that significant savings are possible in appliances, new construction and in particular, existing construction. For example, the emergence of light emitting diodes in a broad range of lighting applications could reduce lighting demand by as much as 90 percent. Retrofit of existing buildings to off-the-shelf technology can reduce consumption by as much as 60 percent. Although society is demanding more and more electric appliances, energy efficiency and smart energy devices will reduce their consumption significantly. Strategies to reduce energy used per capita should consider new technologies to the extent that they will be more efficient, environmentally benign and reduce reliance on fossil fuels.”

RES 2030 also established the goal of reducing regional natural gas per capita consumption by 15 percent by 2030 is to be achieved by:

- Re-powering or replacement of the existing power plants with high efficiency combined cycle turbines by 2010 and 2015, respectively.
- Increase use of solar water heating in residential, pool and commercial uses to offset natural gas demand.
- Promote the use of high efficiency distributed generation technologies (such as combined heat and power).
- Promote the insulation of un-insulated homes built before the development of building energy codes.

RES 2030 has served as the reference point used by SANDAG to provide comment on proposed energy infrastructure projects. The biggest energy infrastructure project proposed in decades in the region is the proposed SPL transmission project. The SANDAG Board of Directors voted

unanimously to take no position on the proposed transmission project on November 17, 2006. The supporting discussion to the “no position” resolution is instructive in explaining the role of *RES 2030* in guiding SANDAG to adopt a neutral position toward the transmission line.⁶⁸

“The Regional Energy Strategy (RES), which was adopted by the SANDAG Board of Directors on July 25, 2003, is being used as a basis for the EWG (Energy Working Group of SANDAG) review of the proposed SPL (Sunrise Powerlink). The RES promotes a mix of power production from centralized and distributed generation resources. Distributed generation is power generated at or near its point of use, typically smaller and more efficient than centralized facilities. The RES recognizes the need for local and imported power but calls for the majority of power used by San Diegans to be produced locally. Several goals in the RES address electricity supply and infrastructure capacity.

The RES includes a goal of increasing the total electricity supply from renewable resources to 15 percent by 2010, 25 percent by 2020, and 40 percent by 2030. Subsequent to adoption of the RES, more stringent state law has been adopted requiring 20 percent renewables by 2010. The Governor also has proposed an additional goal of 33 percent renewables by 2020. The use of transmission is needed to meet the renewables goal, but it is unclear whether this need could be met using existing or other new transmission options. Currently, there is no assurance that the SPL will be used to deliver a significant amount of renewable power to the region. It also should be noted that the RES goal calls for an emphasis on in-region renewable installations.

The RES includes a goal to increase the transmission system capacity as necessary to maintain required reliability and to promote better access to renewable resources and low-cost supply. This goal could be met through improvements to existing transmission infrastructure, from the SPL, or from other transmission options currently under review at the state and federal levels.”

SANDAG is also engaged in SDG&E’s long-term planning process. SANDAG described how the substantive aspects of the *RES 2030* should be incorporated into SDG&E’s long-term plan in a September 8, 2006 letter to SDG&E that was included as an attachment to SDG&E’s long-term plan submittal to the CPUC. The September 8, 2006 SANDAG letter is included as **Attachment E**.

7.2 SDG&E 2007-2016 Long-Term Procurement Plan

SDG&E submitted its 2007-2016 Long-Term Procurement Plan (LTPP) to the CPUC on December 11, 2006.⁶⁹ The major elements of the LTPP are summarized below.

Energy efficiency and peak demand reduction:

- Energy efficiency should reduce forecast peak demand by 487 MW and 2,561 GWh by 2016 (~40 MW per year peak reduction attributable to energy efficiency).
- Demand response programs expected to produce a 5 percent peak reduction (249 MW).

- Distributed generation (DG) including California Solar Initiative will reduce peak load by 225 MW (at time of peak), with the expectation that CSI will produce 150 MW (out of 300 MW forecast); rate of DG increase is about 1 to 2 MW per year currently.

LTPP includes scenarios with and without SPL:

- Add resources with attention to the *Energy Action Plan* loading order.
- SDG&E ran high, low, base case scenarios for need until 2016.

Renewable energy:

- Sixteen (16) percent of energy need is currently under contract as renewables (including the dish Stirling solar contract), with assumption that SDG&E may contract for more than 20 percent total (to account for shortfalls, cancellations) to meet overall renewable energy goal.
- New transmission is essential for cost-effective procurement to meet 20 percent goal by 2010.

Conventional power generation resources:

- Assume South Bay Power Plant retires in 2009.
- Encina Power Plant stays online.
- AB 1576 does not give repowering and replacement (of aging coastal power plants) any unique status that puts them at the head of the contract “line.”
- 250 MW of new peaking gas turbines will be added in 2008-2009.

AB 32 greenhouse gas mitigation and reduction:

- Reduction goal levels not yet known, baseline for reduction has not yet been established (could be 1990, current or other year).
- GHG emissions will only see a substantial reduction if baseload plants become more efficient.

Distributed generation:

- No specific set-asides listed for combined heat and power.

7.3 Additional Strategic Plans Developed for the San Diego Region

Four additional strategic assessments have been developed for the San Diego region or areas within the region. The common thread between these assessments is an examination of the benefits and costs of moving to a renewable energy future. These assessments are summarized in **Attachment F** and include:

7.3.1 Perspectives on Regional Renewable Energy Potential

*Energy Parks to Balance Renewable Energy in San Diego Region (July 2007).*⁷⁰ This assessment evaluates the potential for developing a large number of 5 to 10 MW renewable energy power generation facilities in the more rural areas of San Diego County on commercially-

available land. Concentrating solar technologies, such as concentrating PV, are emphasized. Energy parks would be limited to 5 to 10 MW per site, equivalent to approximately 25 to 50 acres, primarily because of the difficult topography. The study includes an initial assessment of the quantity of commercial land potentially available for this purpose. A programmatic environmental siting process for suitable commercial land is recommended to reduce siting uncertainty and facilitate financing of these projects.

*Creating a Sustainable Economy – San Diego/Tijuana Case Study (March 2007).*⁷¹ The energy portion of this report projects: 1) the amount of land area necessary to meet regional energy needs using rooftop PV, and 2) the economic benefits that would result from converting to PV-based power generation from current fossil fuel-based power generation. The report concludes that all the region's electricity needs could be met by solar energy by fully utilizing the PV potential of existing residential, commercial, and parking areas. The report also projects substantial economic benefits by meeting local power needs with PV in the region instead of sending dollars out of the local economy to purchase fossil fuel-based electric power.

*Green Energy Options to Replace the South Bay Power Plant (February 2007).*⁷² This study analyzes options for replacing the capacity of the South Bay Power Plant in the context of a Chula Vista CCA. Three different levels of renewable energy generation are assessed, 50 percent, 70 percent, and 90 percent. The estimated wholesale price of power generation is estimated between \$0.08/kWh and \$0.11/kWh for these three scenarios. Current SDG&E energy charges average in the range of \$0.13/kWh and \$0.17/kWh depending on level of consumption. The study underscores a key advantage of non-profit, public CCA structure – access to low-cost municipal bond financing. The study also highlights that access to this low-cost financing makes renewable energy projects more cost-competitive under public financing than when financed by IOUs or private developers.

*Potential for Renewable Energy in the San Diego Region (August 2005).*⁷³ This analysis looked at the renewable energy potential in the region, including San Diego County, Imperial County, and wind power just over the border in Baja California. The estimated peak output technical potential of residential and commercial PV in 2010 is 4,400 MW, 1,800 MW commercial PV and 2,600 residential PV, with an associated annual energy production of approximately 7,000 GWh. This estimate does not include the technical PV potential of parking areas and parking structures. The technical potential of concentrating solar technology in more rural areas of San Diego County is estimated at 2,900 MW and 5,000 GWh.

7.3.2 Photovoltaic Potential of Parking Lots and Parking Structures

As noted, *Potential for Renewable Energy in the San Diego Region* does not include an estimate of the PV potential of open ground-level parking lots or parking structures. It is necessary to have a rudimentary idea of the PV potential of parking areas and parking structures in the San Diego region, since these are often ideal candidates for commercial-scale PV arrays. The 250 kW PV array on the Qualcomm campus parking structure in Sorrento Valley, and the 235 kW Kyocera “solar grove” PV array in Kearny Mesa, are two examples of the potential of parking

structures and ground-level parking lots. Descriptions of these two installations are provided in Section 12 of this report.

Envision Solar is a San Diego-based company that evolved out of the development of the 235 kV “solar grove” PV array in the parking lot of the Kyocera facility on Kearny Mesa. Envision Solar specializes in the development of PV arrays for ground-level parking lots. Powers Engineering requested an estimate of the parking lot square footage in San Diego County from Envision Solar. The rough estimate of the actual PV potential of open parking lots and parking structures is 3,000 MW.⁷⁴ This estimate assumes that only 25 percent of total estimated parking surface in the county is sufficiently open, meaning not shaded to a significant degree, that its full solar potential can be realized. The assumptions used to develop the 3,000 MW estimate of PV potential for open parking lots and parking structures are provided in Table 7-2.

Table 7-2. Assumptions Used to Estimate PV Potential of Parking Lots - San Diego County

Assumption	Source
771 vehicles per 1,000 citizens	Dr. Donald Shoup, urban planning, UCLA
At least 4 parking spaces per vehicle, one of which is residential space	Dr. Donald Shoup, urban planning, UCLA
3,000,000 people	Approximate San Diego County population, 2006 U.S. Census update
162 square feet	Square footage of typical 9-foot by 18-foot parking space, Envision Solar
6,939,000 non-residential parking spaces in San Diego County	calculated value: $3,000,000 \times (771/1,000) \times 3$ spaces [4 total spaces per car – 1 residential space per car]
11 watts per square foot	PV capacity per square foot of parking area, in alternating current (AC) output, Envision Solar
12,365 MW	parking lot PV technical potential, calculated value: $6,939,000$ spaces \times 162 square feet per space \times 11 watts per square feet \times 1 MW per million watts
3,000 MW	Rough estimate of actual PV potential - assumes 25 percent of non-residential parking spaces are unshaded throughout the day and full PV potential can be realized at these sites, Powers Engineering ⁷⁵

8. Energy Efficiency - First in the Loading Order

8.1 Forecast Energy Efficiency Reductions vs. Real Reductions

Energy Action Plan II (2005) lists specific steps to be taken to reduce energy demand in California. For example, it specifically calls for the implementation of actions outlined in the governor’s 2004 *Green Buildings Action Plan* to improve building performance and reduce grid-

based electrical energy purchases in all state and commercial buildings by 20 percent by 2015, per Executive Order S-20-04. Executive Order S-20-04 states that:⁷⁶

“Commercial buildings use 36 percent of the state's electricity and account for a large percentage of greenhouse gas emissions, raw materials use and waste.

It is ordered that state agencies, departments, and other entities under the direct executive authority of the Governor cooperate in taking measures to reduce grid-based energy purchases for state-owned buildings by 20 percent by 2015, through cost-effective efficiency measures and distributed generation technologies.

The California Public Utilities Commission (CPUC) is urged to apply its energy efficiency authority to support a campaign to inform building owners and operators about the compelling economic benefits of energy efficiency measures; improve commercial building efficiency programs to help achieve the 20 percent goal; and submit a biennial report to the Governor commencing in September 2005, on progress toward meeting these goals.

The CEC will undertake all actions within its authority to increase efficiency by 20 percent by 2015, compared to Titles 20 and 24 non-residential standards adopted in 2003; collaborate with the building and construction industry state licensing boards to ensure building and contractor compliance; and promptly submit its report as per Assembly Bill 549 (Statutes of 2001) on strategies for greater energy and peak demand savings in existing buildings.”

The objective described in *Energy Action Plan II* is unambiguous for government and commercial buildings – a 20 percent reduction in grid-based energy purchases by 2015 compared to a concrete 2003 baseline. Executive Order S-20-04 states that government and commercial buildings consume 36 percent of the state’s energy. It is of value to calculate what the impact of a 20 percent reduction in energy purchases by government and commercial buildings in SDG&E service territory on the electricity demand projected by SDG&E for 2015.

Total electric power consumption in SDG&E service territory in 2003 was approximately 20,000 GWh.⁷⁷ A 20 percent reduction below the 2003 total is a reduction of 4,000 GWh. The resulting total annual electric power consumption would be 16,000 GWh.

The City of San Diego has been very active in conducting energy efficiency upgrades to city buildings. The city has carried-out approximately 70 energy efficiency upgrade projects to date under a CEC low-interest-rate loan energy efficiency incentive program. The primary requirement of this loan program is that each qualifying project has a simple payback of no more than 10 years. The average energy efficiency improvement for these City of San Diego projects is approximately 20 percent based on the most recent energy consumption measurements.⁷⁸

SDG&E promotes the energy efficiency potential of new and remodeled commercial buildings through its Sustainable Communities Program.⁷⁹ A Sorrento Valley business, TKG Consulting Engineers, Inc., was recognized by SDG&E for achieving a 30 percent reduction in energy usage

beyond the California new building energy efficiency standard. In regard to this remodeling project, SDG&E notes, “*TKG’s new office building is a model for other San Diego County projects. It demonstrates that energy efficiency, occupant comfort, and environmentally friendly design is cost-effective, and be achieved even with a tight construction schedule.*”⁸⁰

The energy efficiency of the TKG building was improved by: 1) adding insulation to the interior of the existing concrete walls, 2) adding a film to the existing single glazed windows, 3) use of a variety of high efficiency lighting strategies, 4) occupancy sensors for private offices, 5) and use of a high efficiency air conditioning system. SDG&E also sited a 40 kW PV array on the roof of the TKG building to provide renewable power to the utility’s distribution grid. This is a potential model for the local siting of utility-owned PV generation.

Energy Action Plan II also describes ambitious energy efficiency goals for the utilities, stating:

“For the past 30 years, while per capita electricity consumption in the US has increased by nearly 50 percent, California electricity use per capita has been approximately flat.” and “Most recently, in September 2004, the CPUC adopted the nation’s most aggressive energy savings goals for both electricity and natural gas. In achieving these targets, the IOUs (investor-owned utilities) will save an additional 5,000 MW and 23,000 GWh per year of electricity, and 450 million therms per year of natural gas by 2013.”

The goals described by the CPUC represent a 10 percent reduction over business-as-usual. The utilities would be well on the road to achieving an overall absolute 20 percent reduction in electric power consumption by 2015 if the goals described in this excerpt from the *Energy Action Plan* were referenced to a 2003 baseline.

These goals are not referenced to a 2003 baseline. The goals are referenced to utility projections of future demand. The flaw in energy efficiency requirements imposed by the CPUC on utilities is that the energy efficiency and demand response savings are calculated relative to forecast energy usage and peak demand, not a fixed baseline year. As a result, the utility can assume high per capita growth in electricity consumption, combined with robust population growth, to forecast very high energy usage rates prior to the application of energy efficiency measures. The utility then applies energy efficiency measures to this high projected usage to eliminate 10 percent of this consumption by 2013. This is a “paper” reduction in demand. The on-the-ground reality of these high forecasts and paper reductions is an ever-increasing demand for electricity. That is why energy efficiency gains should be measured relative to a baseline year, as in Executive Order S-20-04, to be meaningful.

SDG&E is projecting that both per capita energy consumption and per capita peak electricity demand will increase in SDG&E service territory between 2007 and 2016.⁸¹ This forecast increase runs counter to California’s 30-year history of “no change” in per capita energy consumption. It is the reliance on forecast paper reductions instead of absolute reductions relative to a fixed baseline year that allows SDG&E to state in the 2007-2016 Long-Term Procurement Plan that “*SDG&E does not believe that significantly more energy efficiency savings could be realistically achieved from a technical standpoint.*”⁸²

8.2 Maximizing Energy Efficiency Reductions

SDG&E could save an additional 4,800 GWh through expanded, cost-effective energy efficiency programs. This is nearly 25 percent of the San Diego region's current annual energy consumption of approximately 20,000 GWh. Major efficiency opportunities include greatly expanded upgrades/replacement of cooling systems, lighting, refrigeration, and greatly expanded weatherization programs. A 2020 target date to achieve a 20 percent reduction in energy consumption and peak demand would allow time to re-design the current energy efficiency program so that all economically justifiable energy efficiency retrofits are carried-out. This target date would also allow convenient phase-in of long-life high efficiency devices as the original devices, specifically central air conditioning units and refrigerators, reach the end of their useful lives.

All energy efficiency upgrades with a reasonable energy savings payback period reduce energy costs in SDG&E's service territory. Energy efficiency measures also drop greenhouse gas emissions and air pollution. It is for these reasons that energy efficiency is first in the loading order. However, realizing full energy efficiency benefits will only occur if the utility or a delegated third party funds the efficiency upgrades as a standard, across-the-board practice for all customers. Customers are unlikely to decline an efficiency upgrade if they incur no additional out-of-pocket expenses and the utility or a designated third party manages the transaction to minimize customer inconvenience.

8.2.1 Cost-Effective Energy Efficiency Potential

California's three IOUs achieved a combined total of 6,200 GWh of energy efficiency savings through 2006. However, the CPUC wants utilities to develop far bolder energy-saving strategies to improve grid reliability and cut customer costs. The Utility Ratepayers Network (San Francisco) has indicated that the difference between economically achievable energy efficiency reductions and what has actually occurred to date is so stark that a different utility energy efficiency program design and longer-term market strategies must be considered.⁸³

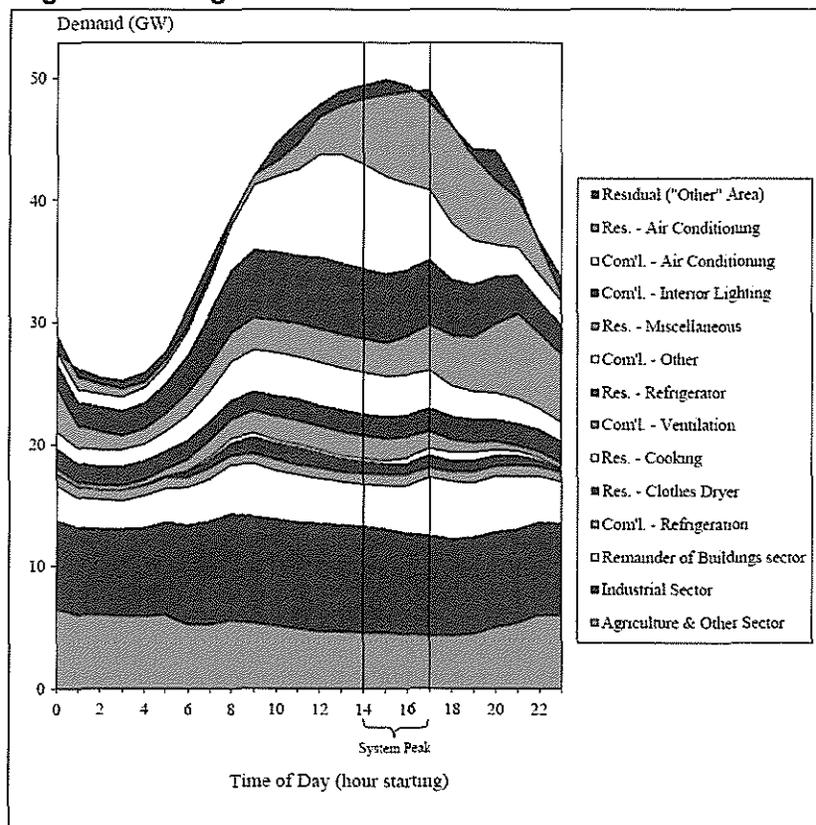

A May 2006 energy efficiency potential study prepared by Itron, Inc. for California's three IOUs estimates that as much as 48,000 GWh of reduction is attainable in existing buildings statewide with economical technologies.⁸⁴ The study identifies that 58,000 GWh is technically possible in existing structures, though not all 58,000 GWh would be considered cost-effective using the cost comparison methodology currently applied.

SDG&E represents about 10 percent of the California IOU load. Ten (10) percent of the 48,000 GWh of cost-effective statewide energy efficiency reduction potential is 4,800 GWh, about one-quarter of the estimated 20,000 GWh in total annual power sales in SDG&E service territory.

8.2.2. High Value Energy Efficiency Opportunities in San Diego County

Figure 8-1 provides a breakdown of the demand by device type on hot summer days. Air conditioning load is the dominant contributor to peak power demand on the hottest days of summer, comprising approximately one-third of total demand. In SDG&E service territory, this means a 1,500 MW air conditioning load out of a peak load of up to 4,600 MW. The statewide relationship between air conditioning load and peak load for 2005 is provided in **Attachment G**. Despite the predominance of air conditioning load during peak demand periods, relatively little forward progress has been made in reducing this load.

Figure 8-1. Largest Contributors to California Peak Demand⁸⁵

SDG&E relies on the May 2006 Itron study in measuring its energy efficiency performance.⁸⁶ SDG&E uses the Itron study as the yardstick in assessing energy efficiency savings projected by SDG&E compared to the universe of technically achievable energy efficiency savings identified by Itron. Itron is also a contractor to SDG&E tasked with developing smart meter software.⁸⁷

Itron largely avoids the issue of increasing the efficiency of central air conditioning units by stating that the 2006 federal standard for new units is Seasonal Energy Efficiency Ratio (SEER) 13 and the highest SEER rating of "economical" central air conditioning units is 14.⁸⁸ Itron goes on to state there is little difference between SEER 13 and SEER 14 in terms of efficiency and therefore no economic justification for upgrading from SEER 13 to SEER 14.

However, the average SEER rating for in-use central air conditioning units in California is approximately SEER 10, not the 2006 federal minimum standard of SEER 13 for new units.⁸⁹ Competitively-priced central air conditioning units with ratings as high as SEER 21 are commercially available. As noted below, there is about a 20 percent installed price difference between a SEER 13 or 14 unit and a SEER 21 unit. An incremental energy efficiency improvement of nearly 30 percent is realized by selecting a SEER 21 unit over SEER 13 when compared to the SEER 10 basecase.⁹⁰ Itron does acknowledge that major energy efficiency reductions can be achieved in residential and commercial heating and air conditioning systems, though in the context of emerging technology instead of off-the-shelf technology.⁹¹

Itron also does not address new thermal storage air conditioning systems now on the market which could nearly eliminate cooling-related peak demand if installed in new and existing buildings throughout the region. Graphs of the peak cooling demand reduction achieved by these commercially available thermal storage air conditioning systems are presented in **Attachment H**.

Cost-effective and largely untapped energy efficiency savings can readily be employed on existing commercial and institutional cooling systems as well. Many commercial buildings use electric motor-driven centrifugal chillers to provide cooling. Centrifugal chillers typically consume more electricity than any other single energy-consuming device in a commercial building.⁹² The Center for Sustainable Energy has been a leader in conducting energy efficiency evaluations of these cooling systems, conducting hundreds of energy efficiency evaluations on these systems locally. Over 90 percent of these systems operate with relative low efficiency, in the range of 1.0 to 1.2 kW per ton of cooling, using oversized pumps, constant speed equipment, and controls that do not work well.^{93,94}

A new trend in these commercial and industrial “chiller plant” cooling systems is converting all devices to variable speed operation and simplified control of the whole system. The initial conversions to this ultra-efficient operating format resulted in an average energy-use reduction of 54 percent over a three-year period.⁹⁵ The results indicate that ultra-efficient all-variable-speed systems are reliable and can be installed for the same cost as “standard” central plant systems.

An example of effective application of all-variable-speed operation to an existing chiller plant is the County of San Diego’s North County Regional Center, with 610,000 square feet of air-conditioned space (courthouse, offices, and jail). The retrofit was completed and commissioned in December 2003 at a cost of \$423,700. Two years later, the entire plant was averaging less than 0.5 kW per ton, saving the county more than \$175,000 a year. The simple payback for this upgrade was less than two-and-a-half years. The North County Regional Center also received a \$205,447 incentive payment from SDG&E, reducing the payback period to 1.3 years.⁹⁶

8.2.2 Achieving an Absolute 20 Percent Reduction in Electricity Usage by 2020

Table 8-1 lists a number of the major energy efficiency opportunities that could significantly reduce peak demand and energy consumption in the region. These include upgrades to cooling systems, lighting (phase-out of incandescent bulbs), weatherization, and refrigeration.

Table 8-1. Cost-Effective Energy Efficiency Opportunities in the San Diego Region

Device Type	Sector	Number ⁹⁷	Average baseline efficiency	Average age of device (years)	Unit of measure	Target efficiency level	Overall potential reduction versus baseline (%)	Potential peak reduction versus baseline (%)	Estimated payback period for typical installation (years)
Central air conditioning	residential/ small commercial	500,000 – 600,000 ⁹⁸	10	10.7	SEER ⁹⁹	20	50	50	depends on location and use of dynamic pricing ¹⁰⁰
Central air – ice storage	medium and large commercial	22,843	new product	new product	kW per ton	advantage is shifting cooling load to nighttime	no change	80	depends on location and use of dynamic pricing
Central heating/cooling plants	large commercial	689	1.0 – 1.2	unknown	kW per ton	0.5 – 0.7	30 - 50	30 – 50	depends on location and use of dynamic pricing
Central heating/cooling Plants – chilled water storage	large commercial	689	1.0 – 1.2	retrofit	kW per ton	0.5 – 0.7	30 - 50	80	depends on location and use of dynamic pricing
Lighting	residential	1.2 million	10 – 20	1	% CFL ¹⁰¹	100	~60	~60	< 1
Refrigeration	residential	1.2 million	931 ¹⁰²	7	kWh/yr	721	20	20	NA - new federal efficiency standard
Weatherization – utility energy conservation upgrade	residential	primarily pre-1990 homes	Title 24 new construction standard ¹⁰³	20+	kWh/yr	> 30% from existing condition	30 ¹⁰⁴	30	Presumed to be comparable to commercial building payback.
Weatherization – LEED existing building retrofit	commercial, all types	141,200	Title 24 new construction standard	20+	kWh/yr	> 30% from existing condition	30 ¹⁰⁵	30	2.6 ¹⁰⁶

A 2020 target date to achieve a 20 percent reduction in energy consumption and peak demand would allow time to re-design the current energy efficiency program so that all economically justifiable energy efficiency retrofits are in fact carried-out. This target date would also allow convenient phase-in of long-life high efficiency devices as the original devices reach the end of their useful lives. This is typically in the range of 10 to 15 years for central air conditioning units and 7 to 10 years for refrigerators.

Some important actions that would significantly reduce energy consumption in the San Diego area require no action in San Diego other than voicing support. For example, legislation currently in the California Assembly (AB 722, Levine) would ban incandescent bulbs in the residential size range, 25 watts to 150 watts, by 2012. Incandescent bulbs would be replaced principally by compact fluorescent lighting (CFL). CFLs reduce electricity demand 75 percent compared to an incandescent bulb of comparable intensity. Currently only 10 to 20 percent of the light bulbs in California residences are CFLs.¹⁰⁷

All energy efficiency upgrades with a reasonable energy savings payback period reduce energy costs in SDG&E's service territory. However, it is unlikely that large numbers of individual consumers will be willing to spend significant additional sums of up-front money to maximize the energy efficiency of their residences and businesses. Yet it is in the interest of the community and the region that these residences and businesses are as energy efficient as feasible from a cost perspective.

The utility must fund the difference between the lowest cost, higher energy consuming device and a cost-effective state-of-the-art upgrade if the objective is to realize much of the potential efficiency gains in the region. This is also true of weatherization. The current SDG&E energy efficiency incentives are provided in **Attachment I**. These rebate and incentive payments are modest. No incentive payments are currently offered for central air conditioning system upgrades. The program is far too modest to achieve the energy efficiency targets contemplated for *San Diego Smart Energy 2020*.

Carrier Corporation is a leading provider of central air conditioning systems. The energy demand of a 3-ton Carrier Corporation SEER 10 central air conditioning unit is approximately 4.0 kWh under hot summertime conditions.¹⁰⁸ The company advertises a 56 percent reduction in electricity demand for its Infinity® 21 (SEER 21) model compared to a SEER 10 unit.¹⁰⁹ In an area of the county where air conditioning may be necessary much of the summer, in the range of 800 to 1,000 hours per year, more than 2,000 kWh of energy demand would be eliminated over the course of the summer peak period by selecting the Infinity® 21 for the upgrade.¹¹⁰

As noted, the 2006 federal standard for new central air conditioning units is SEER 13. Is it cost-effective to purchase a SEER 21 unit over a SEER 13 unit solely on the basis of energy savings? Yes. The difference in the installed cost prior to rebates of a reference case Carrier Corporation 3-ton SEER 13 residential central air and heating unit, which costs approximately \$9,000, and a state-of-the-art Infinity® 21 unit (SEER 21) is around \$2,000.¹¹¹ Carrier offers a rebate on high efficiency units that reduces the cost difference between the SEER 13 and SEER 21 alternatives. The SEER 21 unit would save approximately 1,200 kWh relative to the SEER 13 unit over 1,000 hours.^{112,113} Summer peak savings would be \$300 per year, assuming a peak demand rate of \$0.25/kWh and smart meters to measure real-time consumption. By way of comparison

regarding peak rates, SDG&E is already proposing a critical peak pricing rate of \$1.20/kWh for non-residential customers in an effort to reduce peak demand.¹¹⁴ The simple payback for the \$2,000 additional cost of the Infinity® 21 would be 6 to 7 years.

Implementing a cost-effective state-of-the-art requirement for residential central cooling system upgrades would be quite simple in concept. For example, SDG&E would advise local heating and cooling system contractors that the utility will pay the difference between the base price for a central air conditioning system that meets the 2006 federal SEER 13 standard and a state-of-the-art unit (SEER 21 in 2007). SDG&E, or a third party provider such as the Center for Sustainable Energy, would identify each municipality and area in the county where the upgrade is automatic, such as Ramona, Lakeside, Santee, Poway, and El Cajon. The incentive payment in cooler areas of the county where air conditioning systems are run on only the very hottest days, such as La Jolla or Pacific Beach, would be pro-rated to cover the additional cost of the highest SEER rating that is cost-effective based on air conditioning usage patterns in that area.

That conversion to smart meters offers another relatively painless method for dramatically reducing peak load on hot days.¹¹⁵ There are an estimated 500,000 to 600,000 central air conditioning units in residences in the San Diego region.^{116,117} Most or all of these units are in operation on the hottest days of summer. Smart meters with home thermostat control are capable of increasing the set-point room temperature automatically to reduce air conditioning load.

Cycling the set-point of one-half of the central air conditioner population from 72 °F to 78 °F for 10 or 15 minutes, and repeating this cycling with the other half of the population for 10 to 15 minutes, would reduce instantaneous MW load during critical peak demand periods by hundreds of MW with almost no impact on the comfort of end users. Residences with sensitive populations, such as the elderly or chronically sick, would be kept out of this type of program. Other customers could opt-out if a compelling reason was provided after the customer had been included in the program for a time and had experienced the impact (or lack of impact) of air conditioning cycling on the comfort level within the residence.

Effective building weatherization is a necessary component of any program intended to minimize the cooling demand. SDG&E has a low-income weatherization program that reached approximately 10,000 homes in 2005.¹¹⁸ SDG&E reports that the weatherization program elements are cost-effective but does not report the actual reduction in peak electricity demand realized as a result of the program.

However, the City of Houston has published case study data on a 2006 weatherization program conducted in an older neighborhood that resulted in a 14 percent reduction in peak energy demand.¹¹⁹ Six hundred homes, with an average age of 40 to 60 years in the range of 1,000 to 1,300 square feet, were weatherized. The program was basic. Homes were weatherized with caulking, weatherstripping, and attic insulation of nine inches. The program cost an average of \$1,000 per home. Average savings were \$160 in the 2006 summer season.

9. Demand Response: Current Utility Program, Pricing and Smart Meters¹²⁰

9.1 Why California is falling short on reducing peak demand

California will fall short of achieving its goal of reducing system peak demand for the three investor owned utilities by 5 percent in the summer of 2007. This goal specifically applies to price response programs that can be called on a day in advance and are designed to address forecasted peaks or supply constraints. Price response programs are likely to reduce peak demand by 2.2 percent, or less than half of the target percentage.

To identify why the state's demand response goals will not be achieved this year, the Brattle Group, which provides consulting services and expert testimony in economics, finance and regulation interviewed two dozen stakeholders within and outside of California. Several reasons for not meeting the demand response goals emerged.

First, the goals focused solely on price response programs, which require advanced interval meters. When the goals were set, only customers with greater than 200 kW demand, representing about one-fourth of the system peak load, had these meters. Achieving the 5 percent goal from large customers alone requires that they reduce their peak demand by about 20 percent.

Second, even by 2011, when advanced metering infrastructure will be installed for customers under 200 kW, a large portion of the electricity consumption in the commercial customer class with demand under 200 kW will continue to be protected from rate changes by AB 1X. This protection may last through the year 2021.

Large customers already face time-of-use (TOU) rates that charge higher prices for demand during peak periods. Many of the largest customers have been on TOU for years. Over 23,000 advanced interval meters were installed for customers with greater than 200 kW of demand as a result of AB 29X. The legislation required that all meter recipients shift to TOU rates. Much of the potential for peak load reduction from the largest commercial customers has already been realized as they have adapted their operations to higher peak prices.

The utilities have proposed voluntary critical peak pricing rates and peak time rebates to accommodate the AB 1X provisions. However, the true potential for demand response from commercial customers is unlikely to be achieved due to a combination of complications. For example, there is currently a built-in disincentive to customers with average demand under 200 kW and with a high peak demand to leave a program, AB 1X, that protects these customers from rate spikes.

The current approach appears to be too centered on the utility and may need to be replaced with an approach focused on customer needs and infrastructure constraints. California lags behind states with restructured power markets where all large customers above 1 MW face default hourly real-time pricing tariffs. Most regions with active demand response programs have both “day ahead” and “day of” programs using a combination of pricing and rebate payments to encourage customers to lower peak loads and/or shift load to off-peak periods.

9.2 Steps necessary to get more from demand response

Rate and program designs must be developed that better reflect the value of demand response to the electricity system and the value of consumption to customers. California has pursued its energy efficiency goals through a combination of programs and standards. At least half of the efficiency gains that have been realized since 1975 have been due to standards. Now may be the time to examine the potential for using standards to achieve the state's demand response goals.

Cost-benefit methodologies for evaluating demand-side programs need to be improved. Protocols must be developed for measuring demand response impacts. Innovative rate designs are needed that incorporate the risks of outages and high peak generation costs.

Dynamic rate designs and effective protocols for measuring demand response impacts are steps toward solving these problems. There is a need to better educate customers about the costs embodied in current rates, the benefits that could come from broad adoption of dynamic rates, the true impacts on their electricity costs that would result from such a change, and the options they have for responding.

Many customers assume such rates would amount to rate increases when in fact utility revenue would not change. Customers whose consumption patterns reflect below average peak consumption would see bill reductions. Those with above average peak consumption would see increases that reflect the degree to which their peak consumption is currently receiving a hidden subsidy from other customers.

9.3 Smart meters are a part of the solution

The demand for electricity is highly concentrated in the top 1 percent of hours of the year. In most parts of the United States, these 80 to 100 hours account for roughly 8 to 12 percent of the maximum or peak demand. In California, they account for approximately 11 percent.

If a way can be found to reduce some of this peak demand, it would eliminate the need to install generation capacity that would be used less than 100 hours a year. This generating capacity is primarily gas-fired peaking combustion turbines. This is expensive power generation given these turbines are idle for almost all of the year.

How much will be saved by demand response will depend on two things: 1) how much peak load can be reduced by customers and 2) how much generation (and related power delivery) investment and fuel can be offset by this load reduction. The first item depends on two things: how rapidly utilities and regulators move to install new pricing designs that provide the correct price signals to customers, and how well customers respond to the price signals.

A prerequisite to the provision of dynamic pricing is the installation of Advanced Metering Infrastructure (AMI). Depending on features and geography, AMI investment costs can range from \$100 to \$200 per meter. Much of that cost can be recovered through operational benefits

such as avoided meter reading costs, faster outage detection, improved customer service, better management of customer connects and disconnects, and improved distribution management.

Many utilities have already installed AMI because they were able to recover their entire investment through operational benefits. According to a recent Federal Energy Regulatory Commission report, AMI currently reaches 6 percent of electric meters in the United States. Certain states, such as Pennsylvania and Wisconsin, have AMI penetration rates in excess of 40 percent. AMI penetration rates are in the double digits in eight states.¹²¹

California's three investor-owned utilities tested a variety of dynamic pricing designs in a \$20 million pilot project that involved approximately 2,500 residential and small commercial and industrial customers over a three-year period. The experimental process involved a working group that was facilitated by the CPUC and CEC and many interested parties, some opposed to dynamic pricing and some supporting it.

The California experiment provided time-varying prices and smart meters to all participants. In addition, some of the participants also received enabling technologies such as smart thermostats and always-on gateway systems. Smart thermostats automatically raise the temperature setting on the thermostat by 2 or 4 degrees when the price becomes critical. Always-on gateway systems adjust the usage of multiple appliances in a similar fashion and represent the state-of-the art.

The experiment showed that the average Californian customer reduced demand during the top 60 summer hours by 13 percent in response to dynamic pricing signals that were 5 times higher than their standard tariff. Customers who had a smart thermostat reduced their load about twice as much, by 27 percent. And those who had the gateway system reduced their load by 43 percent. The AMI meters that SDG&E will install will be capable of supporting smart thermostat controls and gateway systems.

The gateway "smart meter" system represents the maximum technical potential for demand reduction in the residential customer class. The smart meter system has the potential for lowering peak demand by 43 percent. In the commercial and industrial classes, automatic demand response programs that control multiple end-use loads while working with the energy management system that is installed in most facilities are projected to reduce demand by 13 percent. The weighted average technical demand response potential for all classes is estimated at approximately 23 percent.

The peak demand in SDG&E service territory in 2007 was 4,636 MW. A 23 percent reduction in 2007 peak demand through use of smart meters represents a demand reduction of approximately 1,070 MW. SDG&E estimates that the use of smart meters in SDG&E territory will result in a 5 percent reduction of peak demand 2016, a forecast demand reduction of 249 MW.¹²²

10. San Diego Solar Initiative: Cost-Effective Regional Photovoltaics

10.1 Design of California Solar Initiative

The SB1 “million solar roofs” legislation has established the objective of adding 3,000 MW of commercial and residential PV installations in California by 2017. SDG&E serves approximately 10 percent of the IOU customer base in California, and for that reason it is assumed that 300 MW of this PV capacity will be added in SDG&E service territory.¹²³ \$3.35 billion in incentives will be paid-out over the course of the 10-year program. The objective of these incentive payments, in combination with federal and state tax incentives, is to make PV cost-competitive with purchased utility power.

The 12 kW system example shown in Table 10-1 demonstrates the financial impact of the incentive payment and tax credits on the net cost of the PV system. The 12 kW system used in the example is presumed to be a system installed on a residence under a commercial third party power purchase agreement structure.

Table 10-1. Net Cost of 12 kW PV System under SB1 California Solar Initiative¹²⁴

Cost or (Credit), \$	Cost Element
100,000	gross cost of 12 kW PV system @ approximately \$8 per installed watt
(15,000)	net CSI incentive payment, gross incentive of \$25,000 less income tax paid of \$10,000
(30,000)	30 percent federal tax credit on gross cost
(28,000)	depreciation on gross cost less tax credit ($\$70,000 \times \text{tax rate}$)
27,000	net cost of PV system

The annual loan payment would be \$2,500 per year, assuming the net capital cost of \$27,000 is amortized at 7 percent interest over 20 years. This system would be expected to generate approximately 1,550 kWh per year kW installed, or $1,550 \text{ kW} \times 12 \text{ kW} = 18,600 \text{ kWh}$ per year. Dividing the annual cost of \$2,500 by the annual power production of 18,600 kWh gives a unit electricity generation cost of \$0.135/kWh. This compares to a typical current SDG&E electric energy charge of \$0.15 to \$0.25/kWh for residential customers.¹²⁵

Commercial PV systems rely on the incentives, tax credits, and depreciation shown in Table 10-1 to produce electricity that is competitive with utility electricity rates. The major program under SB1 is the California Solar Initiative (CSI). CSI has a \$2.165 billion incentives budget and a goal of 1,940 MW of new PV capacity by 2017. The CSI program provides performance-based incentive payments for each kWh produced from commercial PV systems instead of a flat initial payment for smaller systems that is based on the size of the PV system.

The fundamental concept behind the CSI program is that a large increase in demand for PV systems will steadily reduce the cost of PV to the point where PV technology will be cost-

competitive with purchased utility electricity rates by 2017 without incentive payments (though assuming federal and state tax credits remain). Expectations of large growth in PV capacity are predicated on the cost of PV steadily dropping over the next decade to half the current cost due in part to the large demand increase created by the CSI incentives.

Favorable utility tariffs will play an important role in driving the expanded use of PV in commercial systems as well. Most of the initial CSI incentives for commercial PV systems went to applicants in PG&E service territory, in part because of favorable rate structure for PV systems. This rate structure, known as the A-6 tariff, pays nearly triple the proposed SDG&E rate for commercial solar power.¹²⁶ The PG&E and SDG&E rate structures for commercial solar installations are compared in Table 10-2. A SDG&E commercial solar tariff structure that is comparable to the PG&E tariff would allow commercial PV in SDG&E service territory to compete on a level playing field for statewide incentive payments under CSI.

Table 10-2. Comparison of PG&E and SDG&E Commercial PV Rate Structures

	PG&E A-6 tariff	SDG&E AL-TOU tariff (proposed) ¹²⁷
Energy Charges (\$/kWh)		
Summer		
Peak	0.319	0.109
Part-peak	0.157	0.092
Off-peak	0.093	0.073
Winter		
Peak		0.108
Part-peak	0.138	0.100
Off-peak	0.102	0.079
Demand Charges (\$/kW)		
Facility charges	none	10.70
Summer peak	none	4.72
Winter	none	3.59

10.2 Proposed San Diego Solar Initiative

10.2.1 Achieving 50 Percent Greenhouse Gas Reduction with Photovoltaics

A primary goal of *San Diego Smart Energy 2020* is to reduce greenhouse gas emissions from power generation serving San Diego County customers as rapidly as cost-effectively feasible. Accelerated use energy efficiency measures and renewable energy will be necessary to achieve this goal. The *Regional Energy Strategy 2030* establishes a goal of 50 percent of the renewable energy used in the region coming from local renewable energy resources. The large majority of the renewable resources that SDG&E is proposing to utilize to meet the SB 107 “20 percent by 2010” renewable energy mandate, primarily biomass, wind, geothermal, and solar power, will be imported from other regions.

The most abundant renewable resource in San Diego County is the sun. San Diego County currently has approximately 38 MW of installed commercial and residential PV capacity. San Diego County also has thousands of MW of PV potential on existing commercial buildings, parking lots and parking structures, and residences. Rooftop PV has the advantage of being relatively non-controversial from a siting standpoint. The City of San Diego and San Diego Schools pay less per kWh for PV power purchased from third party providers than the energy charge they would otherwise pay SDG&E for the same power generated by conventional power plants. This is possible under the current matrix of PV incentives, tax credits, and depreciation that apply to these PV systems.

For these reasons, the renewable energy component of *San Diego Smart Energy 2020* is focused on local rooftop PV, primarily commercial installations, to expand the renewable energy component of the power used by San Diego County businesses and residences from 20 percent in 2010 to 50 percent in 2020. PV is arguably the best renewable energy “fit” for San Diego County, due primarily to the fact that PV is generated at the point of use and is generally operating at or near capacity when electric power is most needed and most valuable. This is especially true if the PV systems are equipped with adequate battery storage to operate as reliable peaking power units during summertime afternoon peak demand periods.

The renewable energy component of *San Diego Smart Energy 2020* would require the addition of just over 2,000 MW of PV by 2020 to achieve a 50 percent GHG reduction from electric power generation. A leading developer of commercial solar PV was contacted by Powers Engineering to provide an estimate of the incentives budget necessary to cost-effectively meet this PV target by 2020. “Cost-effective” in this case means a payback in approximately 10 years for a commercial PV system in a market where the benchmark utility electric rate is \$0.12/kWh. The estimated life-of-project PV incentives budget to achieve this goal is estimated at \$1.5 billion (in 2007 dollars).¹²⁸ All of this \$1.5 billion incentive budget would be utilized to build renewable PV distributed generation in the San Diego region. The *San Diego Solar Initiative* is an appropriate name for this PV program.

The *San Diego Solar Initiative* would be far less expensive than the proposed SPL transmission project over time. The capital cost estimated by SDG&E for its portion of the transmission project is \$1.265 billion. The estimated total cost over the 40-year project lifetime, including SDG&E profit, is approximately \$7 billion in 2010 dollars.¹²⁹ A recent proposal by SDG&E to underground the transmission line between Lake Hodges and Santa Ysabel could add up to another \$300 million to the capital cost, increasing the estimate to \$1.565 billion.¹³⁰ This would in turn increase the levelized cost of the project over 40 years from \$7 billion to \$8.3 billion.

The cost to build transmission lines is also rising rapidly in general. A recent report prepared by the Brattle Group for the Edison Foundation states that price increases in the past several years have affected all utility sector investments from coal and wind power projects to transmission and distribution projects. Between January 2004 and January 2007, the costs of steam-generation plants, transmission projects, and distribution equipment rose by 25 to 35 percent (compared with an 8 percent rise in the overall price level). The coauthor of the report noted that if these cost increases persist, they will confront utilities and regulators with even tougher choices on capital investment plans in the future, and motivate stepped-up conservation and

demand-side programs.¹³¹

The levelized annual cost of the proposed SPL transmission project, in 2006 dollars, is \$174 million per year for 40 years. This expenditure would provide 1,000 MW of additional import capacity to the San Diego region. However, there is no assurance that there will be power to import over the line during periods of peak regional demand. For example, the California Independent System Operator (CAISO) declared a statewide Stage 1 electrical emergency on August 29, 2007 from 3:20 pm to 8:00 pm. A Stage 1 emergency designation is a call for voluntary conservation. The Stage 1 press release issued by CAISO stated a primary reason for the Stage 1 emergency was, “*temperatures throughout the Southwest continue to climb, decreasing the availability of imported power.*”¹³² The existence of transmission capacity does not assure that the transmission capacity can be utilized during periods of peak demand if electricity demand is peaking throughout the region at the same time.

The \$1.5 billion incentives budget under the *San Diego Solar Initiative* would total \$1.5 billion over 20 years in current dollars. The average annual cost of the *San Diego Solar Initiative*, in 2007 dollars, would be \$76 million per year over the 20-year life of the incentive payment program, less than one-half the cost of the SPL over the same time period. The distribution of the \$1.5 billion in PV incentives is shown in the PV incentive program financing plan summary tables included in **Attachment J**.

The \$1.5 billion budget would incentivize the installation of 2,040 MW of commercial PV (primarily) in the San Diego region by 2020. This PV capacity will be equipped with sufficient battery storage so that it can reliably serve the afternoon peak load at rated output. This capacity is in addition to the 300 MW of PV that will be installed in SDG&E service territory by 2017 as a result of SB1.

The assumptions behind this addition of 2,040 MW by 2020 are that current federal tax credits and accelerated depreciation remain in place, and customers pay a third party provider \$0.12/kWh for the PV energy. Additional assumptions are that the majority of the installed capacity, approximately 75 percent, will be commercial installations over 100 kW, and that a high level of standardization will be utilized by a limited number of large contractors to minimize costs through bulk purchasing of PV system hardware.

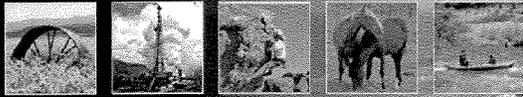

Achieving the goal of 2,040 MW installed by 2020 under the *San Diego Solar Initiative* is also based on the installed cost of PV systems dropping by approximately 40 percent between 2008 and 2017. The *San Diego Solar Initiative* would be a major PV incentive program in addition to SB1, accelerating the decline in PV cost relative to conventional power generation. The current installed cost of residential rooftop PV systems is approximately \$8 per watt prior to incentive payments and tax credits (see Table 10-1). The cost is 10 to 15 percent lower for large wholesale buyers of PV panels and associated hardware.¹³³

This projected decline in the cost of PV systems is conservation relative to U.S. Department of Energy (DOE) projections and current industry trends. Figure 10-1 is a DOE projection of the decline in PV costs through 2020. DOE estimates PV will reach cost parity with high cost conventional baseload power generation by 2020 under a “business as usual” scenario. The

Stirling Energy Systems Solar Two Project

Stirling Energy Systems (SES) has submitted an application to the Bureau of Land Management (BLM) for development of the proposed SES Solar Two Project, a concentrated solar electrical generating facility capable of generating 750 megawatts (MW) of renewable power. The proposed SES Solar Two Project site is located on approximately 6,140 acres of federal land managed by the BLM and approximately 300 acres of privately owned land.

The project site is in Imperial County, California, approximately 4 miles east of Ocotillo, and 14 miles west of El Centro. Generally, the proposed site boundary is the Union Pacific Railroad on the north and Interstate 8 on the south. The eastern boundary is approximately 1½ mile west of Dunaway Road; and the western boundary is the westerly section line in Section 22 in Township 16 South, Range 12 East. An additional 125 acre construction area is located east of Dunaway Road.

The project would be constructed in two phases. Phase I of the project would consist of up to 12,000 SunCatchers with a nominal generating capacity of 300 MW. Phase II would consist of approximately 18,000 SunCatchers, expanding the project to approximately 30,000 SunCatchers, with a total generating capacity of 750 MW.

The SunCatcher is a 25-kilowatt solar dish that is designed to automatically track the sun and collect and focus solar energy onto a power conversion unit (PCU), which generates electricity. The system consists of a 38' high by 40' wide solar concentrator in a dish structure that supports an array of curved glass mirror facets. These mirrors collect and concentrate solar energy onto the solar receiver of the PCU.

The proposed SES Solar Two Project also includes an electrical transmission line, water supply pipeline, and a site access road. A new 230-kV substation would be constructed approximately in the center of the project site. This new substation would be connected to the existing SDG&E Imperial Valley Substation via an approximately 10.3 mile, double-circuit, 230 kV transmission line. Approximately 7.56 miles of the new line would be constructed offsite. Other than this interconnection transmission line, no new transmission lines or off-site substations would be required for the 300 MW Phase 1 construction. The full Phase II expansion of the project, and delivery of the additional renewable power to the San Diego regional load center, would require the construction of the 500 kV Sunrise Powerlink transmission line proposed by SDG&E. The off-site 6-inch diameter water supply pipeline would be constructed a distance of approximately 3.4 miles from the Westside Main Canal to the project boundary. The water pipeline would be routed in the Union Pacific Railroad right-of-way (ROW), or adjacent to this ROW on federal and private lands. A site access road would be constructed from Dunaway Road to the eastern boundary of the project site, generally following an existing road.

On June 30, 2008, SES submitted an Application for Certification (AFC) to the California Energy Commission (CEC). CEC is the State agency responsible for reviewing and ultimately approving or denying all applications to construct and operate thermal electric power plants of 50 MW and greater.

The BLM and CEC have executed a Memorandum of Understanding concerning their intent to conduct a joint environmental review of the project in a single National Environmental Policy Act (NEPA)/California Environmental Quality Act (CEQA) process. It is in the interest of the BLM and CEC to share in the preparation of a joint environmental analysis of the proposed project to avoid duplication of staff efforts, to share staff expertise and information, to promote intergovernmental coordination at the local, state, and federal levels, and to facilitate public review by providing a joint document and a more efficient environmental review process.

Over the coming months, the CEC and BLM will conduct a number of public workshops and hearings on the proposal to determine whether the proposed project should be approved for construction and operation and under what set of conditions. These workshops and hearings will provide the public as well as local, state and federal agencies the opportunity to ask questions about, and provide input on, the proposed project. The CEC will issue notices for these workshops and hearings at least 15 days prior to the meeting.

Additional project details, status, copies of notices, an electronic version of the AFC, maps and figures, and other relevant documents are available at <http://www.energy.ca.gov/sitingcases/solar2wo/> under *Project Proceeding*.

Reports

(AFC) to construct and operate the Stirling Energy Systems Solar Two project (SES Solar Two), a solar dish Stirling systems project in Imperial County, California.

The proposed SES Solar Two project would be a nominal 750-megawatt (MW) Stirling engine project, with construction planned to begin either late 2009 or early 2010. Although construction would take approximately 40 months to complete, renewable power would be available to the grid as each 60-unit group is completed. The primary equipment for the generating facility would include the approximately 30,000, 25-kilowatt solar dish Stirling systems (referred to as SunCatchers), their associated equipment and systems, and their support infrastructure. Each SunCatcher consists of a solar receiver heat exchanger and a closed-cycle, high-efficiency Solar Stirling Engine specifically designed to convert solar power to rotary power then driving an electrical generator to produce grid-quality electricity. The 6,500 acre project site is located on approximately 6,140 acres of federal land managed by the Bureau of Land Management (BLM) and approximately 360 acres of privately owned land. The site is approximately 100 miles east of San Diego, 14 miles west of El Centro, and approximately 4 miles east of Ocotillo Wells.

The project will be constructed in two phases. Phase I of the project will consist of up to 12,000 SunCatchers configured in 200 1.5-MW solar groups of 60 SunCatchers per group and have a net nominal generating capacity of 300 MW. Phase II will add approximately 18,000 SunCatchers, expanding the project to a total of approximately 30,000 SunCatchers configured in 500-1.5-MW solar groups with a total net generating capacity of 750 MW.

The Applicant has applied for a ROW grant for the Project Site from the Bureau of Land Management (BLM) California Desert District. Although the Project is phased, it is being analyzed in this Application for Certification as if all phases will be operational at the same time.

The project would include the construction of a new 230-kV substation approximately in the center of the project site, and would also be connected to the SDG&E Imperial Valley Substation via an approximate 10.3-mile, double-circuit, 230-kV transmission line. Other than this interconnection transmission line, no new transmission lines or off-site substations would be required for the 300-MW Phase I construction. The full Phase II expansion of the project will require the construction of the 500-kV Sunnyside Powerlink transmission line owned and operated by SDG&E. Within the Project

Energy Commission Facility Certification Process

The Energy Commission's facility certification process carefully examines public health and safety, environmental impacts and engineering aspects of proposed power plants and all related facilities such as electric transmission lines, natural gas pipelines, etc.

The Energy Commission is the lead agency under the California Environmental Quality Act (CEQA) and has a certified regulatory program under CEQA. Under its certified program, the Energy Commission is exempt from having to prepare an environmental impact report. Its certified program, however, does require environmental analysis of the project, including an analysis of alternatives and mitigation measures to minimize any significant adverse effect the project may have on the environment.
