SUMMARY

As part of the United States Department of the Interior, Bureau of Land Management (BLM), Grand Junction Field Office (GJFO) Resource Management Plan (RMP) revision, the GJFO Interdisciplinary Team analyzed whether proposed Areas of Critical Environmental Concern (ACECs) met the relevance and importance criteria. The Interdisciplinary Team analyzed 51 proposed ACECs (existing, internally, and externally proposed) (**Figure 1**, Proposed ACECs) and found that 23 met the relevance and importance criteria, for a total of 167,146 acres (**Table 1**, Proposed ACECs Found to Meet the Relevance and Importance Criteria; **Figure 2**, ACECs Recommended for Analysis in the Draft RMP). Note that expansions of existing and proposed ACECs are counted as one ACEC in the above totals. Three external proposals, one existing ACEC, and one internal proposal were for areas within either the Dominguez-Escalante or McInnis Canyon National Conservation Areas (NCAs), which are outside of the decision area for this RMP; therefore, the areas were not assessed as part of this report.

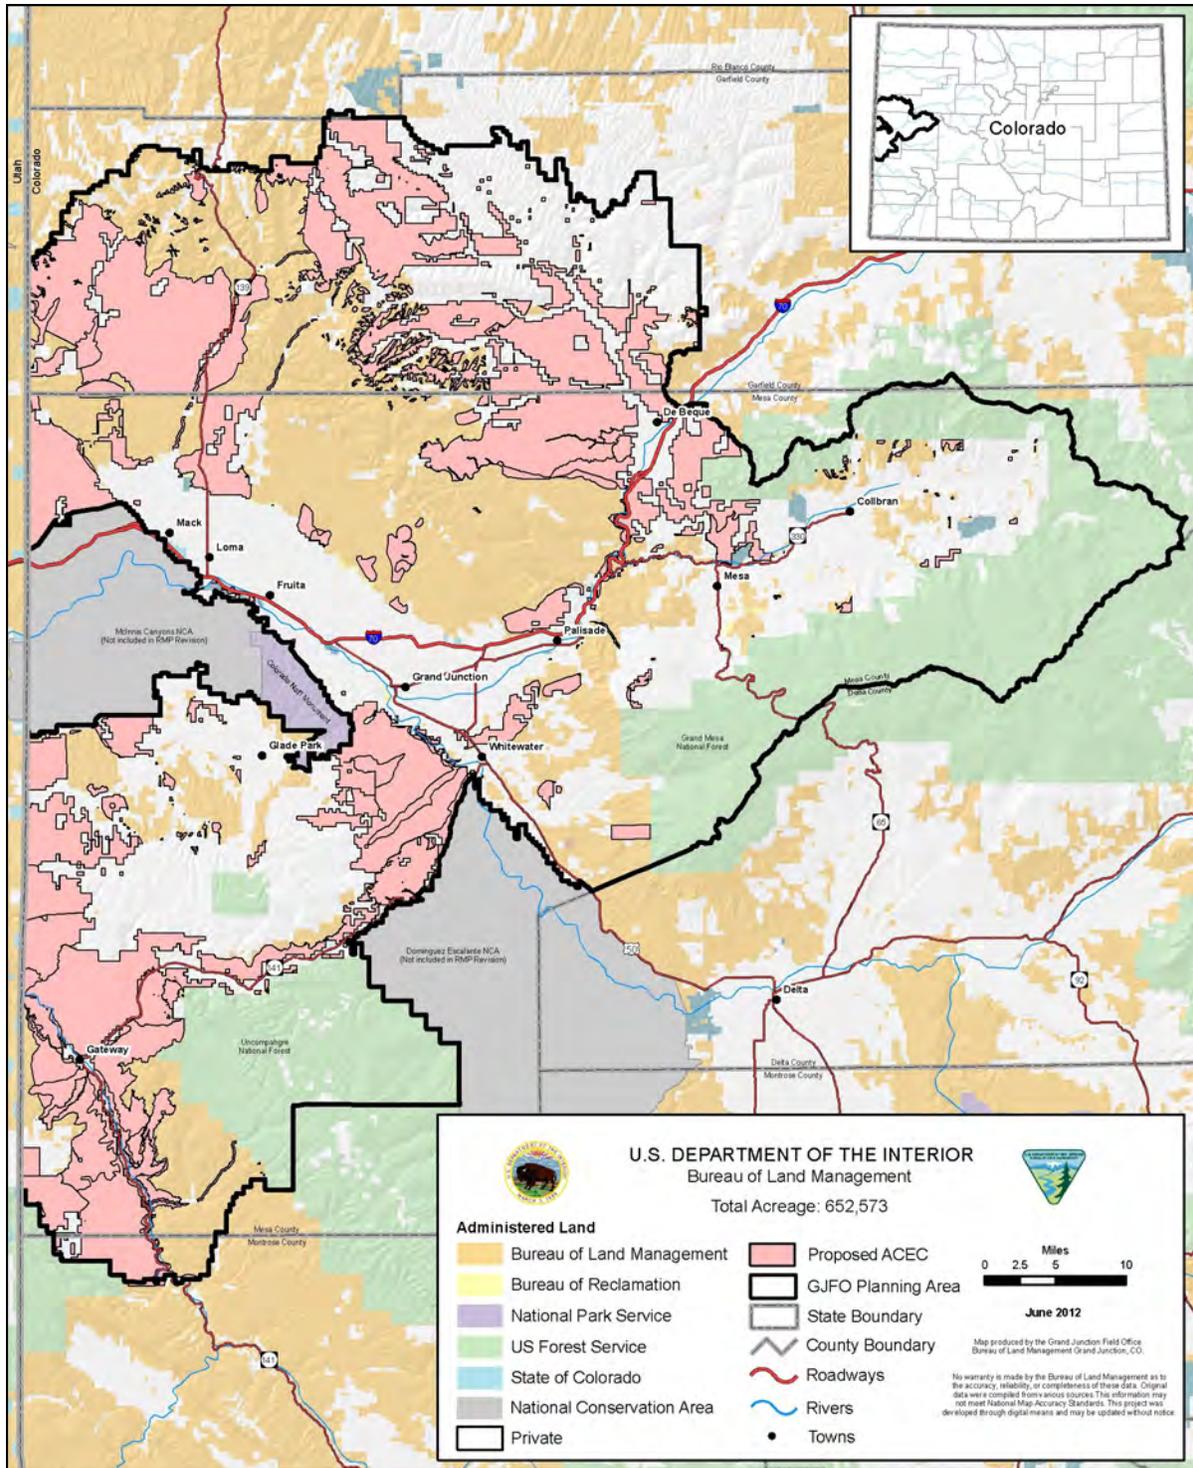

The areas found to meet both the relevance and importance criteria will be identified as potential ACECs and will be fully considered for designation and management in the RMP (BLM Manual 1613.2.21). See **Appendix A**, Maps of ACECs Recommended for Further Analysis in the Draft RMP, for maps of recommended ACECs. For the areas found not to meet the relevance and importance criteria, “the management prescriptions which are eventually established in the plan for such areas shall reflect consideration of the identified values.”

This report was completed in January 2010. Since that time the BLM has made the following changes: 1. Found an additional staff-proposed area that meets the relevance and importance criteria (i.e., Plateau Creek); 2. Found, based on updated monitoring data, that the Rapid Creek area does not meet the relevance and importance criteria; and 3. Included additional discussion of areas proposed by the public for special recreation management.

I. INTRODUCTION

As part of the process for developing the Grand Junction RMP revision, the GJFO Interdisciplinary Team reviewed all BLM-managed lands in the planning areas to determine whether any areas should be considered for designation as ACECs. The Federal Land Policy and Management Act (FLPMA) requires that priority shall be given to the designation and protection of ACECs. ACECs are defined in FLPMA Section 103(a) (43 United States Code [USC] 1702) and in 43 Code of Federal Regulations (CFR) 1601.0-5(a) as “areas within the public lands where special management attention is required (when such areas are developed or used or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources or other natural systems or processes, or to protect life and safety from natural hazards.” The following analysis and the resultant

findings for ACEC relevance and importance criteria has been performed pursuant to FLPMA Section 202(c)(3) (43 USC 1712), 43 CFR 1610.7-2, and BLM Manual 1613, *Areas of Critical Environmental Concern*.

Figure I

II. REQUIREMENTS FOR ACEC DESIGNATION

To be eligible for designation as an ACEC, an area must meet the relevance and importance criteria described in 43 CFR 1610.7-2 and BLM Manual 1613, and need special management. The determinations in this report deal strictly with the relevance and importance criteria, and not special management attention.

Relevance and importance are defined as follows:

Relevance: There shall be present a significant historic, cultural, or scenic value, a fish or wildlife resource or other natural system or process, or natural hazard.

Importance: The above described value, resource, system, process, or hazard shall have substantial significance and value, which generally requires qualities of more than local significance and special worth, consequence, meaning, distinctiveness, or cause for concern. A natural hazard can be important if it is a significant threat to life or property.

Relevance

An area meets the relevance criterion if it contains one or more of the following:

1. A significant historic, cultural, or scenic value (including but not limited to rare or sensitive archeological resources and religious or cultural resources important to Native Americans).
2. A fish and wildlife resource (including but not limited to habitat for endangered, sensitive, or threatened species or habitat essential for maintaining species diversity).
3. A natural process or system (including but not limited to endangered, sensitive, or threatened plant species; rare, endemic, or relic plants or plant communities that are terrestrial, aquatic, or riparian; or rare geological features).
4. Natural hazards (including but not limited to areas of avalanche, dangerous flooding, landslides, unstable soils, seismic activity, or dangerous cliffs). A hazard caused by human action might meet the relevance criteria if it is determined through the resource management planning process to have become part of a natural process.

Importance

An area meets the importance criterion if it meets one or more of the following:

1. Has more than locally significant qualities that give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource.

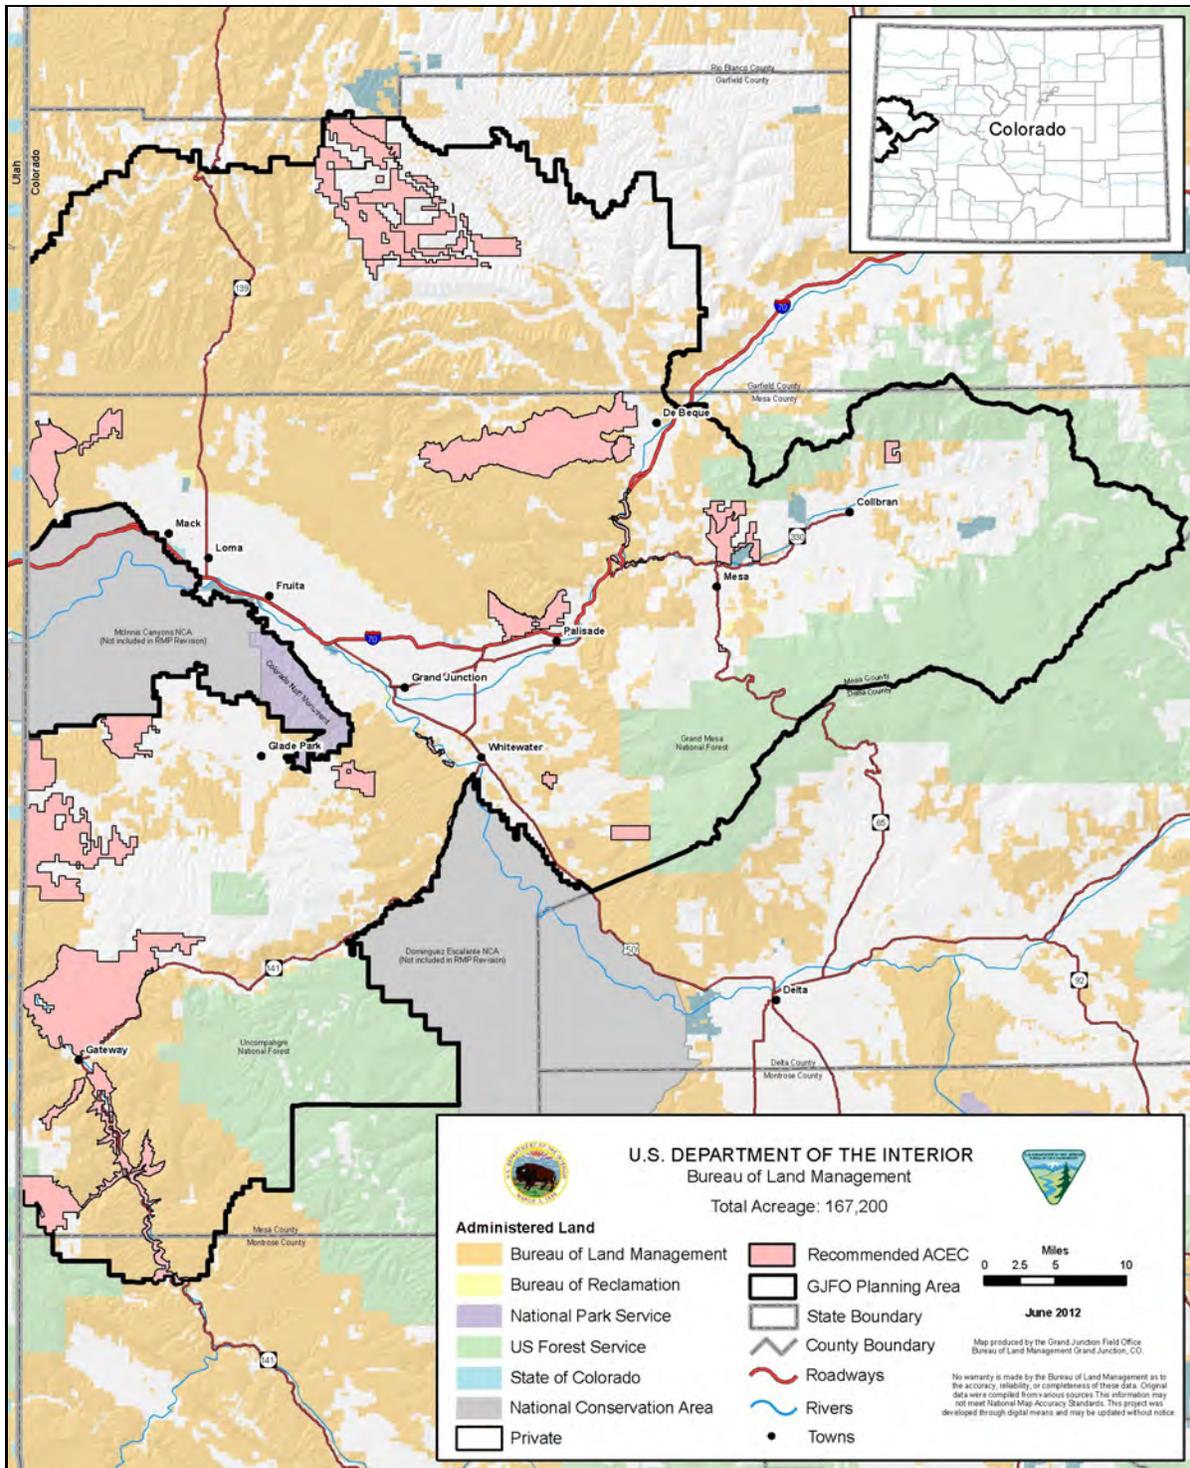

2. Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change.
3. Has been recognized as warranting protection to satisfy national priority concerns or to carry out the mandates of FLPMA.
4. Has qualities that warrant highlighting to satisfy public or management concerns about safety and public welfare.
5. Poses a significant threat to human life and safety or to property.

Figure 2

III. SPECIAL MANAGEMENT ATTENTION

Special management attention refers to “management prescriptions developed during preparation of an RMP or amendment expressly to protect the important and relevant values of an area from the potential effects of actions permitted by the RMP, including proposed actions deemed to be in conformance with the terms, conditions, and decisions of the RMP.” Thus, these are management measures that would not be necessary and prescribed if the relevant and important values were not present.

A management prescription is considered to be special if it is unique to the area involved and includes terms and conditions specifically to protect the values occurring within the area. BLM Manual 1613 includes the following guidance on incorporating management prescriptions for potential ACECs into appropriate alternatives:

During the formulation of alternatives, management prescriptions for potential ACECs are fully developed. Management prescriptions will generally vary across the plan alternatives. If there is no controversy or issues raised regarding the management of a potential ACEC, it may not be necessary to develop a range of management alternatives. In other words, management prescriptions may not vary significantly across alternatives. A potential ACEC (or portion thereof) must be shown as recommended for designation in any or all alternatives in the Draft RMP in which special management attention is prescribed to protect the resource or to minimize hazard to human life and safety. Because special management attention must be prescribed in at least one plan alternative, each potential ACEC will appear as a recommended ACEC in at least one plan alternative. Designation is based on whether or not a potential ACEC requires special management attention in the selected plan alternative (i.e. preferred alternative).

IV. EVALUATION PROCESS

In compiling a list of areas to be analyzed in this report, the BLM Interdisciplinary Team followed the guidance set forth in BLM Manual 1613 and considered:

1. Existing ACECs;
2. Areas recommended for ACEC consideration (internal and external nominations);
3. Areas identified through inventory and monitoring; and
4. Adjacent designations of other federal and state agencies.

ACECs may be nominated by BLM staff, other agencies, or members of the public at any time. During the RMP revision scoping process, the GJFO solicited nominations and comments from the public and other agencies. A map of special

designation areas was distributed at the scoping meetings and made available on the RMP website: <http://www.blm.gov/col/st/en/fo/gjfo/rmp.html>.

As part of the formal outreach process, the BLM received nominations from the Colorado Natural Heritage Program (CNHP) and the Center for Native Ecosystems. The BLM staff also reviewed information from BLM inventories, the Colorado Division of Wildlife (CDOW) species of concern data, and other reports to ensure that all potentially relevant and important values within the planning areas were considered. In evaluating the large number of biological proposals, the BLM determined an area met the relevance criteria for fish and wildlife or natural processes or systems if it contained any special status species (listed, candidate, or BLM sensitive species). If it did not contain a special status species, it met the criteria if it contained species or plant communities that were either ranked G1, G2, S1, or S2 by CNHP. The CNHP rankings are defined as follows:

- G1/S1: Critically imperiled globally or statewide. Species or community is at very high risk of extinction due to extreme rarity (often five or fewer populations), very steep declines, or other factors.
- G2/S2: Imperiled globally or statewide. Species or community is at high risk of extinction due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors.

The maps of ACECs recommended for analysis in the Draft RMP are included in **Appendix A** and are for those areas that were found to meet the relevance and importance criteria. The size and management prescriptions for each ACEC may vary by alternative to reflect a balance between the goals and objectives of the alternative and values being protected (BLM Manual 1613.2.22.B.1-2). **Table 2**, Relevance and Importance Criteria Evaluation for Existing and Proposed ACECs, summarizes the proposed ACECs evaluated, the values assessed, and whether the criteria were met (including supporting information).

					<p>The ACEC meets the relevance and importance criteria for a natural system that supports sensitive plants and ongoing hydrologic research. Rare plants include grand buckwheat (<i>Eriogonum contortum</i>) and Ferron's milkvetch (<i>Astragalus musiniensis</i>). Also contains rare plant species cliffdweller's cryptantha (<i>Cryptantha elata</i>) and Gardner's saltbrush/salina wildrye (<i>Atriplex gardneri/Elymus slaina</i>).</p> <p>The Badger Wash watershed was withdrawn for experimental purposes, scientific research, and studies by Executive Order 10355 in 1952. The Badger Wash ACEC was put in place to protect these values, particularly the hydrologic studies examining the effects of grazing on runoff, sediment, and salinity on this Mancos Shale landscape prevalent in western Colorado and Utah. Studies have occurred since 1953 and published reports are available. Cooperative hydrologic studies are ongoing,</p>

					supported by the BLM, US Geological Survey, and US Bureau of Reclamation. Meets the relevance criteria for a natural system and importance criteria for sensitive plants and to satisfy national priority concerns.			
Badger Wash Potential <i>Public Proposed</i>	Fish	None	None	No	Meets the relevance criteria for rare plants in isolated areas and wildlife supporting habitat for burrowing owls. As proposed the site does not meet the importance criteria because it is overly broad and all areas contained within the proposal are not considered unique compared to other habitat within the range of the species. A portion of this site (355 acres) will be carried forward in the proposed Badger Wash ACEC expansion. The proposed area contains designated release sites for the Mesa County Prairie Dog Relocation project; however these sites do not meet the relevance and importance criteria. The area does not meet the relevance or importance criteria for fish bearing

					<p>Roan and Carr Creeks.</p> <p>Meets the relevance criteria for a natural process or system which supports the BLM sensitive plant species Piceance bladderpod. The area contains A-ranked (excellent quality) occurrences of the bladderpod. In addition to the bladderpod, the site also contains hanging garden sullivantia (<i>Sullivantia hapemanii</i> var. <i>pupusii</i>) and narrowleaf cottonwood/skunkbrush (<i>Populus angustifolia/Rhus trilobata</i>) communities. Meets the importance criteria because the bladderpod is vulnerable to adverse change.</p> <p>Meets the relevance criteria for wildlife resource (sage-grouse) because it contains occupied, potential, and vacant/unknown greater sage-grouse habitat. Does not meet importance criteria because these areas are small portions of the currently occupied range of the Parachute-Piceance-Roan population of the greater sage-grouse and are not locally significant.</p>			Valley ACECs

Plants	3	1 and 2			<p>supporting rare plants. Meets the importance criteria for more than locally significant qualities and qualities that are sensitive, rare, and unique.</p> <p>Portions of Sinbad Valley that occur on BLM property contain a broad oval depression that is the exposed core of a breached anticline. As the salt (halite) layer in the center of the anticline was exposed to weathering and quickly dissolved, the entire structure collapsed on itself, leaving a valley floor ringed by faults and inward-facing escarpments on the valley rim. Rocks exposed in Sinbad Valley range in age from Pennsylvanian in the lower slopes and valley floor, to Lower Cretaceous in the upper part of the outer rim. The rim includes dramatic exposures of Wingate and Entrada sandstones.</p> <p>Recent rare plant surveys have mapped populations of the newly described and extremely rare Gypsum cateye (<i>Cryptantha gypsophila</i>). This</p>			

Table 2 (continued)
Relevance and Importance Criteria Evaluation for Existing and Proposed ACECs

Comments	1987 RMP Acres	Proposed Acres¹ <i>includes acres from 1987 RMP</i>	Acres Carried Forward¹
					<p>area meets the relevance criteria for the presence of significant cultural resources, historic landscape values, and resources important to Native Americans.</p> <p>Cultural Resource surveys within Sinbad Valley have resulted in recording sites important to the Ute Tribe, including wickiup camps and trails. Alignment and local historical accounts make it likely that the Ute trail, unique because of distinctive travois tread, continues into the proposed ACEC. Plant resources important to the Ute are also present in a high density that may be attributable to historic cultural practices. Traditional use and heritage resources are more than locally significant and give this area special meaning to the Native Americans who traditionally used the area. Ute trails are exemplary to connecting modern visitors to this historic landscape.</p>
