Affected Resources EA Checklist
 Bureau of Land Management, Casper Field Office
WY-060-EA10-114

June 2008 thru May 2010 Oil and Gas Lease Issuance for the Casper Field Office

Determination	Resource	Rationale for Determination
PI	Air Quality	No effects associated with leasing. New information about air quality is available.
NP	Areas of Critical Environmental Concern (ACEC)	No effects associated with leasing, as there are no ACECs identified within the subject parcels.
NP	BLM Natural Areas	No effects associated with leasing, as there are no BLM Natural Areas identified within the subject parcels.
NI	Cultural Resources	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
PI	Greenhouse Gas Emissions	No greenhouse gas emissions associated with leasing. New information on greenhouse gas emissions available.
NP	Environmental Justice	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NP	Farmlands (Prime or Unique)	No effects associated with leasing, as there are no Farmlands (Prime or Unique) identified within the subject parcels.
NI	Fish and Wildlife Excluding Federally Listed Species	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Floodplains	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NP	Fuels/ Fire Management	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Geology/ Mineral Resources/ Energy Production	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Hydrologic Conditions	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Invasive Species/ Noxious Weeds	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Lands/ Access	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Livestock Grazing	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Migratory Birds	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Native American Religious Concerns	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Paleontology	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NP	Rangeland Health Standards	No effects associated with leasing beyond what

Determination	Resource	Rationale for Determination
		is currently addressed in the Casper RMP.
NI	Recreation	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Socio-Economics	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Soils	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Threatened, Endangered or Candidate Plant Species	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
PI	Threatened, Endangered or Candidate Animal Species	New information and policy changes are discussed further in the EA.
NP	Wastes (hazardous or solid)	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Water Resources/ Quality (drinking/ surface/ ground)	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Wetlands/ Riparian Zones	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NP	Wild and Scenic Rivers	No effects associated with leasing, as there are no Wild and Scenic Rivers identified within the subject parcels.
NP	Wilderness/ Wilderness Study Areas (WSA)	No effects associated with leasing, as there are no Wilderness or WSAs identified within the subject parcels.
NP	Woodland/ Forestry	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Vegetation Excluding Federally Listed Species	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NI	Visual Resources	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NP	Wild Horses and Burros	No effects associated with leasing beyond what is currently addressed in the Casper RMP.
NP	Areas with Wilderness Characteristics	All parcels were screened to determine if wilderness characteristics were present. Screening forms are located in the Casper Field Office.

DETERMINATION –

NP – not present in the area impacted by the proposed or alternative actions

NI – present, but adequately analyzed in RMP/FEIS for leasing actions

PI – present, not analyzed in RMP/FEIS or new information requires further analysis in the EA

**BUREAU OF LAND MANAGEMENT
CASPER FIELD OFFICE
ENVIRONMENTAL ASSESSMENT FOR
JUNE 2008 THRU MAY 2010 LEASE SALE ISSUANCE
WY-060-EA10-114**

1.0 INTRODUCTION

It is the policy of the Bureau of Land Management (BLM) as derived from various laws, including the Mineral Leasing Act (MLA) of 1920, as amended [30 U.S.C. 181 *et seq.*] and the Federal Land Policy and Management Act of 1976 [43 U.S.C. 1701 *et seq.*], to make mineral resources available for disposal and to encourage development of mineral resources to meet national, regional, and local needs.

As required by the Mineral Leasing Act and the Federal Oil and Gas Leasing Reform Act of 1987 (FOOGLRA) (Public Law 100-203, Sec. 5102, dated 12/22/87), an amendment to the MLA and the Code of Federal Regulations (CFR) (43 CFR 3120.1-2), the BLM Wyoming State Office conducts a quarterly competitive lease sale to sell available oil and gas lease parcels. After a public nomination process, a Notice of Competitive Lease Sale (NCLS), which lists lease parcels to be offered at the auction, is published by the BLM State Office at least 45 days before the auction is held. Lease terms and conditions as well as site-specific resource protection stipulations applicable to each parcel are specified in the Sale Notice. The decision as to which public lands and minerals are open for leasing and what leasing stipulations may be necessary, based on information available at the time, is made during the land use planning process. Surface management of non-BLM administered land overlaying federal minerals is determined by BLM in consultation with the appropriate surface management agency or the private surface owner.

In the process of preparing a lease sale the Wyoming BLM State Office sends a preliminary parcel list with the respective nominated parcels to each field office. Field Office staff reviews the legal descriptions of the parcels to determine if they are in areas open to leasing; if appropriate stipulations have been included; if new information has become available which might change any analysis conducted during the planning process; if appropriate consultations have been conducted; and if there are special resource conditions of which potential bidders should be made aware. Each Field Office confirms this review process and their recommendations by preparing a Determination of NEPA Adequacy (DNA) which supports BLM's decision that there have been no changed circumstances warranting further analysis as required under the National Environmental Policy Act (NEPA) of 1969. Once the preliminary parcel review and the DNA is completed and returned to the State Office, the NCLS is generated for available parcels with standard terms and conditions as well as site-specific resource protection stipulations attached per parcel and made available to the public. On rare occasions, additional information obtained after the publication of the NCLS, may result in the withdrawal of certain parcels prior to the day of the lease sale.

This Environmental Assessment (EA) documents the Casper Field Office review of the 313 parcels that were offered during Competitive Oil and Gas Lease Sales conducted from June 2008 through May 2010 and remain either as sold but leases were not issued or unsold. However, leases have been issued for the following parcels: WY-0812-18, WY-0812-22, WY-0812-25, WY-0812-26, WY-0812-31, WY-0812-37, WY-0812-38, WY-0812-39, WY-0812-40, WY-0812-41, WY-0812-42, WY-0812-47, WY-0812-48, WY-0812-49, WY-0812-50, WY-0812-51, WY-0812-54, WY-0812-55, WY-0812-56, WY-0812-57, WY-0812-58, WY-0812-88, and WY-0812-89. While these parcels were included in a general protest of the December 2008 lease sale, the protesters did not identify any specific issues directly related to these particular parcels. The protesters made a general allegation of injury or harm, but never demonstrated that issuing the leases would result in adverse impacts to resource values of the subject parcels. All parcels addressed in this EA are under the administration of the Casper Field Office. Of those 313 parcels (309,598.89 acres), 296 (274,343.75 acres) have been sold but no leases have been issued. Monies have been received for all 296 parcels sold. The remaining 17 parcels, containing 35,255.33 acres, are currently still available for purchase through the non-competitive bidding process for a period of 2 years from the date of the initial respective sale. This EA serves to verify conformance with the approved land use plan, address new information, and provide the rationale for the recommendations of the Casper Field Manager regarding the deferral or the issuance of leases and the deferral or continuation of availability through the non-competitive process for these parcels.

1.1 Purpose and Need

The purpose of this document is to analyze the impacts of issuing leases for parcels sold at several previous competitive oil and gas lease sales to allow private individuals or companies to explore for and develop oil and gas resources on public lands. The decision to offer parcels at previous competitive lease sales from June 2008 through May 2010 were supported by DNAs; however, given the passage of time and potential environmental issues that have arisen since those sales BLM has prepared this EA to analyze whether it remains appropriate to issue leases for these parcels.

The sale and issuance of oil and gas leases is needed to meet the growing energy needs of the United States public. Wyoming is a major source of natural gas for heating and electrical energy production in the lower 48 states, especially for markets in the Eastern United States. Continued sale and issuance of lease parcels is necessary to maintain options for production as oil and gas companies seek new areas for production or attempt to develop previously inaccessible or uneconomical reserves.

1.2 Conformance with Applicable Land Use Plan and Other Environmental Assessments

Pursuant to 40 Code of Federal Regulations (CFR) 1508.28 and 1502.21, this environmental assessment (EA) tiers to and incorporates by reference the information and analysis contained in the Casper Resource Management Plan (RMP) and Final Environmental Impact Statement (FEIS).

The Casper RMP FEIS analyzed a range of alternatives regarding land use allocations, terms and conditions, as well as resource protection stipulations specific to oil and gas leasing. Ultimately Alternative E (Proposed RMP) was selected and approved as the Casper RMP by Record of Decision (ROD) signed December 7, 2007. Federal mineral estate was identified as either administratively unavailable or open for oil and gas leasing throughout the planning area. In addition, the federal mineral estate designated as open for oil and gas leasing was further defined by acres and percentages in the following categories Open with Standard Conditions, Open with Moderate Restrictions, and Open with Major Restrictions, as listed in Table 4-5 of the FEIS and below:

Table 4-5. Total Acres of Federal Mineral Estate Administratively Unavailable for/Open for Oil and Gas Leasing for the Life of the Plan by Alternative in the Casper Planning Area					
Restriction	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E (Proposed RMP)
Open with Standard Conditions Percent (%) of Federal Mineral Estate	1,136,855 24%	446,019 10%	1,012,656 22%	1,524,375 33%	1,080,935 23%
Open with Moderate Restrictions Percent (%) of Federal Mineral Estate	2,711,404 58%	1,196,922 26%	2,058,162 44%	2,445,107 53%	2,506,530 54%
Open with Major Restrictions Percent (%) of Federal Mineral Estate	770,991 17%	2,296,267 49%	1,113,078 24%	662,664 14%	843,139 18%
Administratively unavailable for Leasing Percent (%) of Federal Mineral Estate	37,922 <1%	717,964 15%	473,276 10%	25,026 <1%	226,568 5%

BLM	Bureau of Land Management				

The Casper RMP dictates resource protection and site-specific stipulations that are attached to parcels offered for leasing throughout the Casper Field Office planning area. For a complete listing of all 313 parcels with the applicable terms and conditions as well as site-specific resource protection stipulations, see Appendix A.

1.3 Leasing

Analysis as required by NEPA was conducted by Field Office resource specialists who relied on personal knowledge of the areas involved and/or reviewed existing databases and file information to determine if appropriate stipulations had been attached to each parcel prior to being made available for lease. The following DNAs were prepared by the Casper Field Office in support of the recommendations to initially offer all of the subject parcels for sale, and provide additional information on the site-specific resource protection stipulations for each parcel:

Lease Sale	NEPA Documentation	Date Signed
June 2008	Determination of NEPA Adequacy	01/29/2008
August 2008	Determination of NEPA Adequacy	04/02/2008
October 2008	Determination of NEPA Adequacy	06/05/2008
December 2008	Determination of NEPA Adequacy	08/21/2008
February 2009	Determination of NEPA Adequacy	09/04/2008
April 2009	Determination of NEPA Adequacy	11/20/2008
June 2009	Determination of NEPA Adequacy	02/05/2009
August 2009	Determination of NEPA Adequacy	04/03/2009
October 2009	Determination of NEPA Adequacy	05/27/2009
December 2009	Determination of NEPA Adequacy	08/04/2009
February 2010	Determination of NEPA Adequacy	10/22/2009
May 2010	Determination of NEPA Adequacy	01/22/2010

1.4 Federal, State or Local Permits, Licenses or Other Consultation Requirements

Purchasers of oil and gas leases are required to obey all applicable federal, state, and local laws and regulations including obtaining all necessary permits required should lease development occur. The BLM would not issue leases that would conflict with any local, county, or state plans.

2.0 PROPOSED ACTIONS AND ALTERNATIVES

Oil and gas competitive lease sales occurring from June 2008 through May 2010 within the Casper Field Office boundary yielded 313 lease parcels that were offered for sale and remain either as sold but leases were not issued or unsold. Of these, 296 parcels (275,343.60 acres) were sold but leases were not issued and 17 parcels (35,255.33 acres) are currently available through the non-competitive process for a period of two years after the initial sale date.

2.1 Alternative A No Action:

The BLM NEPA Handbook (H-1790-1) states that for Environmental Assessments (EAs) on externally initiated proposed actions, the No Action Alternative generally means that the proposed action would not take place. In the case of a lease sale, this would mean that an expression of interest to lease (parcel nomination) would be denied or rejected, or if a parcel has been sold, a lease would not be issued for that parcel and monies paid would be returned to the respective bidder.

Under the No Action alternative, the BLM would not issue any of the 296 leases that have been sold, and would not continue to offer for sale the remaining 17 leases that are currently open to non-competitive sale. Surface management would remain the same and ongoing oil and gas development would continue on surrounding federal, private, and state leases. The BLM would

offer a choice to high bidders on parcels with the unissued leases. One option would be for the BLM to reject the high bidder's offer for a parcel and refund paid bonus bids, rents and filing fees. The other option would be where a high bidder chose to accept the lease issuance with any necessary additional stipulations. For purposes of analysis, the no action alternative assumes that high bidders would choose to cancel the purchase and accept the refund.

It is not expected that demand for energy oil and gas will go down, and a decision to not issue these leases would not prevent future leasing in these areas consistent with land use planning decisions, and subject to appropriate stipulations, identified in the Resource Management Plan. Therefore, it is anticipated that these parcels may be nominated and leased at a future date. While future leases may contain more restrictive lease terms, it is reasonable to consider that a substantial portion of the development possible under current planning decisions will be possible under future leases.

2.2 Alternative B Proposed Action:

The Proposed Action is a recommendation from the Casper Field Manager to the State Director to issue leases for 241 of the 313 parcels (200,102.83 acres) and a deferral of issuance for 72 parcels (107,495.67 acres). This recommendation is based on a secondary review that was recently completed to address updated site specific resource data and new information not identified in the land use planning process. As required by 43 CFR 3131.3 standard terms and conditions as well as site-specific resource protection stipulations are attached to each parcel as identified by the Casper Field Office interdisciplinary review panel of specialists.

The deferrals in the recommendation are not indefinite, but based on a specific process to occur. Specifically, 39 of the 75 parcels containing approximately 55,999.90 acres are recommended for deferral of issuance of a lease pending completion of the Casper RMP amendment to address Greater sage-grouse habitat management, as directed in WY IM 2010-012. The BLM Wyoming State Office issued a Notice of Intent (NOI) on June 11, 2010 to amend six BLM Field Office land use plans to comply with WY IM 2010-012 in one Environmental Impact Statement (EIS). The six affected Field Offices are: Casper, Newcastle, Rawlins, Rock Springs, Pinedale, and Kemmerer. Cooperating Agency and Public Scoping Meetings are currently scheduled for all of the affected BLM Field Offices from now through mid August of this year with an anticipated completion date of October 1, 2012.

Forty-nine (49) parcels are recommended for deferral of issuance, containing approximately 87,266.15 acres, require revision/addition/deletion of certain stipulations; some of these parcels may be recommended for deferral for a combination of RMP amendment and new stipulations. These modifications are subject to acceptance/rejection by the High Bidder for each affected parcel. Once the lease stipulations are revised, the High Bidder would be given a chance to accept or reject those changes. Leases would not be issued for those parcels where a High Bidder does not accept the additional or modified stipulations. If the changes are rejected BLM would return all monies received a result of the sale and the parcels would not be subject to development unless and until offered and leased at a future lease sale.

The entire list of the 313 subject parcels addressed in this EA, with the stipulations applied at the initial sale date can be found in Appendix A. Appendix D lists additional stipulations that will need to be applied based on this secondary review, due to updated resource data and new policies. All parcels are listed in Appendix B with the parcel number, acreage, lease number, and location.

Once sold, the lease purchaser has the right to use so much of the leased lands as is reasonably necessary to explore and drill for all of the oil and gas within the lease boundaries, subject to the stipulations attached to the lease (Title 43 Code of Federal Regulation 3101.1-4).

Oil and gas leases are issued for a 10-year period and continue for as long thereafter as oil or gas is produced in paying quantities. If a lessee fails to produce oil and gas, does not make annual rental payments, does not comply with the terms and conditions of the lease, or relinquishes the lease; ownership of the minerals leased revert back to the federal government and may be leased again.

Before a lease owner or operator conducts any surface disturbing activities on the lease, BLM must first approve and Application for Permit to Drill (APD) and a surface use plan specified in Title 43 Code of Federal Regulation 3162.

Surface use restrictions, including timing limitation stipulations (TLS), NSO stipulations, and controlled surface use (CSU) stipulations, as well as unavailable for leasing designations, cannot be retroactively applied to valid, existing oil and gas leases or to valid, existing use authorizations (e.g., Application for Permit to Drill [APD]). Post-lease actions/authorizations (e.g., APDs, road/pipeline ROWs), however, could be encumbered by TLS and CSU restrictions on a case-by-case basis, as required through project-specific NEPA analysis or other environmental review.

2.3 Alternative C Full Lease Issuance:

Under Alternative C, all 313 parcels would be issued with the standard terms and conditions as well as site-specific resource protection stipulations recommended at the time of offering as detailed in Appendix A.

3.0 Description of Affected Environment

This section describes the environment that would be affected by implementation of the alternatives described in Section 2. Aspects of the affected environment described in this section focus on relevant major resources and issues. Certain critical environmental components require analysis under BLM policy. Only those aspects of the affected environment that are potentially impacted are described in detail.

The proposed lease parcels are located in Natrona, Platte, Goshen, and Converse Counties, Wyoming. This environmental assessment (EA) tiers to and incorporates by reference the information and analysis contained in the Casper RMP FEIS.

3.1 Air Resources

In addition to the air quality information in the RMP cited above, new information about GHGs and their effects on national and global climate conditions has emerged since the RMP was prepared. On-going scientific research has identified the potential impacts of GHG emissions such as carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), water vapor; and several trace gases on global climate. Through complex interactions on a global scale, GHG emissions cause a net warming effect of the atmosphere, primarily by decreasing the amount of heat energy radiated by the earth back into space. Although GHG levels have varied for millennia (along with corresponding variations in climatic conditions), industrialization and burning of fossil carbon sources have caused GHG concentrations to increase measurably, and may contribute to overall climatic changes.

This EA incorporates an analysis of the contributions of the proposed action to GHG emissions and a general discussion of potential impacts to climate. Air quality and climate are the components of air resources, which include applications, activities, and management of the air resource. Therefore, the BLM must consider and analyze the potential effects of BLM and BLM-authorized activities on air resources as part of the planning and decision making process.

3.1.1 Air Quality

The U.S. Environmental Protection Agency (EPA) established air quality standards (NAAQS) for criteria pollutants. Criteria pollutants include carbon monoxide (CO), nitrogen dioxide (NO₂), ozone (O₃), particulate matter (PM₁₀ and PM_{2.5}), sulfur dioxide (SO₂), and lead (Pb). Air pollutant concentrations greater than the NAAQS represent a risk to human health.

EPA has delegated regulation of air quality to the State of Wyoming and is administered by the Wyoming Department of Environmental Quality. Wyoming Ambient Air Quality Standards (WAAQS) and NAAQS identify maximum limits for concentrations of criteria air pollutants at all locations to which the public has access. The WAAQS and NAAQS are legally enforceable standards. Concentrations above the WAAQS and NAAQS represent a risk to human health that, by law, require public safeguards be implemented. State standards must be at least as protective

of human health as federal standards, and may be more restrictive than federal standards, as allowed by the Clean Air Act.

The counties that lie within the jurisdictional boundaries of the Casper Field Office are classified as in attainment of all state and national ambient air quality standards as defined in the Clean Air Act of 1977, as amended. Modeling conducted to date by the WYDEQ does not indicate that air quality is likely to exceed any limits specified by the Clean Air Act in the near future.

Although various state and federal agencies monitor air pollutant concentrations, visibility, and atmospheric deposition throughout Wyoming, at present there are only two air quality monitors near the Casper Field Office boundaries; found in Park County. Table 3.1 lists the available air quality monitoring sites in the Bighorn Basin and relevant sites nearby. The Wyoming Department of Environmental Quality (DEQ) operates a PM10 monitor as part of the State and Local Monitoring Site (SLAMS) network in Cody, Wyoming (Park County). Additional SLAMS and Special Purpose Monitoring (SPM) sites operate in nearby counties. Nearby monitoring sites include several IMPROVE monitors and BLM administered sites that are part of the Wyoming Air Resource Monitoring System (WARMS). Atmospheric deposition (wet) measurements of ammonium, sulfate, and various metals are taken at the Sinks Canyon, South Pass and Yellowstone Park sites, which the BLM operates as part of the National Acid Deposition Program (NADP).

Table 3.1: Available Air Quality Monitoring Sites

County	Site Name	Type of Monitor	Parameter	Operating Schedule	Location	
					Latitude	Longitude
Natrona	City County Bldg Center And C Streets	SLAMS	PM ₁₀	1/3	42.851064	-106.325088
Fremont	Antelope Site	SPM	PM _{2.5} , NO _x	Hourly	43.426667	-105.385833
Platte	Laramie River Power Plant Wheatland, Wy		PM ₁₀		42.114967	-104.813088
Fremont	Lander	SLAMS	PM ₁₀ , PM _{2.5}	1/3	42.833	-108.733
Campbell	Thunder Basin	IMPROVE	PM _{2.5} , NO ₃ , Ammonium, Nitric Acid, Sulfate, Sulfure Dioxide & Meterology	1/3 (PM ₁₀); 1/3 & 1/6 (PM _{2.5})	44.663	-105.287
Johnson	Buffalo	WARMS	PM _{2.5} , NO ₃ , Ammonium, Nitric Acid, Sulfate, Sulfure Dioxide & Meterology	1/3 (PM ₁₀); 1/3 & 1/6 (PM _{2.5})	44.144	-106.019

IMPROVE Interagency Monitoring of Protected Visual Environments
 Nox Nitrate
 PM Particulate Matter
 SLAMS State and Local Monitoring Site
 SPM Special Purpose Monitoring
 WARMS Wyoming Air Resource Monitoring System

With only two air quality monitors in the Casper Field Office planning area (Natron/PM 10 and Fremont/PM 10 an dPM2.5) it is difficult to accurately assess existing air quality conditions throughout the area.

However, as noted above, air quality, visibility, and atmospheric deposition are monitored throughout Wyoming, including adjacent planning areas. Therefore, the BLM assessed recent air quality conditions in the Casper Field Office by examining data collected at the two monitors in the area, supplemented by various monitors in neighboring planning areas, as summarized in Table 3.2. The examination of these data indicates that the current air quality for criteria pollutants in the Planning Area is considered good overall. Based on measurements in the area, visibility in the Planning Area is considered excellent.

Table 3.2

Pollutant	Average Time	NAAQS (µg/m ³)	WAAQS (µg/m ³)	Representative Concentrations	
				(ug/m ³)	Year
Carbon Monoxide ⁸	1 hour	40,000	40,000	1979	2005
	8 hours	10,000	10,000	931	2005
Nitrogen Dioxide (NO ₂) ⁴	Annual	100	100	0.004	2006

3.1.2 Climate

The planning area is located in a semiarid mid-continental climate regime typified by dry windy conditions, limited rainfall, and long cold winters (Trewartha and Horn 1980). Table 3.3 summarizes components of climate that could affect air quality in the region.

Table 3.3 Climate data for Casper

Climate Component	Casper, WY
Mean maximum summer temperatures	83.4°F
Mean minimum winter temperatures	13.9°F
Mean annual temperature	45.1°F
Mean annual precipitation	12.5 inches
Mean annual snowfall	77.5 inches
Mean annual wind speed	12.8 mile per hour (mph)
Prevailing wind direction	Southwest

Climate change refers to any significant change in measures of climate (e.g., temperature or precipitation) lasting for an extended period of time (decades or longer). Climate change may result from natural processes, such as changes in the sun's intensity; natural processes within the climate system (such as changes in ocean circulation); human activities that change the atmosphere's composition (such as burning fossil fuels) and the land surface (such as urbanization) (IPCC 2007).

Greenhouse gases that are included in the US Greenhouse Gas Inventory are: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF₆). CO₂ and methane (CH₄) are typically emitted from combustion activities or are directly emitted into the atmosphere. On-going scientific research has identified the potential impacts of greenhouse gas emissions (including CO₂; CH₄; nitrous oxide (N₂O), water vapor; and several trace gasses) on global climate. Through complex interactions on at regional and global scales, these greenhouse gas emissions cause a net warming effect of the atmosphere (which making makes surface temperatures suitable for life on Earth), primarily by decreasing the amount of heat energy radiated by the Earth back into space. Although greenhouse gas levels have varied for millennia (along with corresponding variations in climatic conditions), recent industrialization and burning of fossil carbon sources have caused CO₂ concentrations to increase dramatically, and are likely to contribute to overall climatic changes, typically referred to as global warming. Increasing CO₂ concentrations also lead to preferential fertilization and growth of specific plant species.

Global mean surface temperatures have increased nearly 1.0°C (1.8°F) from 1890 to 2006 (Goddard Institute for Space Studies, 2007). However, observations and predictive models indicate that average temperature changes are likely to be greater in the Northern Hemisphere. Data indicates that northern latitudes (above 24° N) have exhibited temperature increases of nearly 1.2°C (2.1°F) since 1900, with nearly a 1.0°C (1.8°F) increase since 1970 alone. It also shows temperature and precipitation trends for the conterminous United States. For both parameters we see varying rates of change, but overall increases in both temperature and precipitation. Without additional meteorological monitoring systems, it is difficult to determine

the spatial and temporal variability and change of climatic conditions, but increasing concentrations of greenhouse gases are likely to accelerate the rate of climate change.

In 2001, the Intergovernmental Panel on Climate Change indicated that by the year 2100, global average surface temperatures would increase 1.4 to 5.8°C (2.5 to 10.4°F) above 1990 levels. The National Academy of Sciences (2006) has confirmed these findings, but also indicated that there are uncertainties regarding how climate change may affect different regions. Computer model predictions forecasts indicate that increases in temperature will not be evenly or equally distributed, but are likely to be accentuated at higher latitudes. Warming during the winter months is expected to be greater than during the summer, and increases in daily minimum temperatures is more likely than increases in daily maximum temperatures.

Currently, the WDEQ-AQD does not have regulations regarding greenhouse gas emissions, although these emissions are regulated indirectly by various other regulations.

Some greenhouse gases such as carbon dioxide occur naturally and are emitted to the atmosphere through natural processes and human activities. Other greenhouse gases (e.g., fluorinated gases) are created and emitted solely through human activities. The primary greenhouse gases that enter the atmosphere as a result of anthropogenic activities include carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), and fluorinated gases such as hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. These synthetic gases are powerful GHGs that are emitted from a variety of industrial processes.

Ongoing scientific research has identified the potential impacts of anthropogenic greenhouse gas (GHG) emissions and changes in biological sequestration due to land management activities on global climate. Through complex interactions on a regional and global scale, these GHG emissions and net losses of biological carbon sinks cause a net warming effect of the atmosphere, primarily by decreasing the amount of heat energy radiated by the earth back into space. Although GHG levels have varied for millennia, recent industrialization and burning of fossil carbon sources have caused CO₂ concentrations to increase dramatically, and are likely to contribute to overall global climatic changes. The Intergovernmental Panel on Climate Change (IPCC) recently concluded that “warming of the climate system is unequivocal” and “most of the observed increase in globally average temperatures since the mid-20th century is very likely due to the observed increase in anthropogenic greenhouse gas concentrations.”

Several activities contribute to the phenomena of climate change, including emissions of GHGs (especially carbon dioxide and methane) from fossil fuel development, large wildfires and activities using combustion engines; changes to the natural carbon cycle; and changes to radiative forces and reflectivity (albedo). It is important to note that GHGs will have a sustained climatic impact over different temporal scales. For example, recent emissions of carbon dioxide can influence climate for 100 years. In contrast, black carbon is a relatively short-lived pollutant, as it remains in the atmosphere for only about a week. It is estimated that black carbon is the second greatest contributor to global warming behind CO₂ (Ramanathan and Carmichael, 2008).

The lack of scientific tools designed to predict climate change at regional or local scales limits the ability to quantify potential future impacts. However, potential impacts to air quality due to climate change are likely to be varied. Several activities occur within the planning area that may generate greenhouse gas emissions: oil, gas, and coal development, large fires, livestock grazing, and recreation using combustion engines which can potentially generate CO₂ and methane.

Some activities within the Planning Area generate greenhouse gas (GHG) emissions. Oil and gas development activities can generate carbon dioxide (CO₂) and methane (CH₄). CO₂ emissions result from the use of combustion engines, while methane can be released during processing. Wildland fires also are a source of other GHG emissions, while livestock grazing is a source of methane. Other activities in the Resource Area with the potential to contribute to climate change include soil erosion from disturbed areas and fugitive dust from roads, which have the potential to darken snow-covered surfaces and cause faster snow melt. A description of the potential greenhouse gas emissions associated with the proposed leasing activities is included in Section 4.

3.1.3 Visibility

There are several National Parks, National Forests, recreation areas, and wilderness areas surrounding the Casper Planning Area. Table 3.4 lists areas designated as Class I or Class II airsheds. National Parks, Monuments and some state designated Wilderness Areas are designated as Class I. The Clean Air Act “declares as a national goal the prevention of any future, and the remedying of any existing, impairment of visibility in mandatory Class I Federal areas . . . from manmade air pollution.” 42 U.S.C. § 7491(a)(1).25. Under the BLM Manual Section 8560.36, BLM lands, including wilderness areas not designated as Class I, are managed as Class II, which provides that moderate deterioration of air quality associated with industrial and population growth may occur.

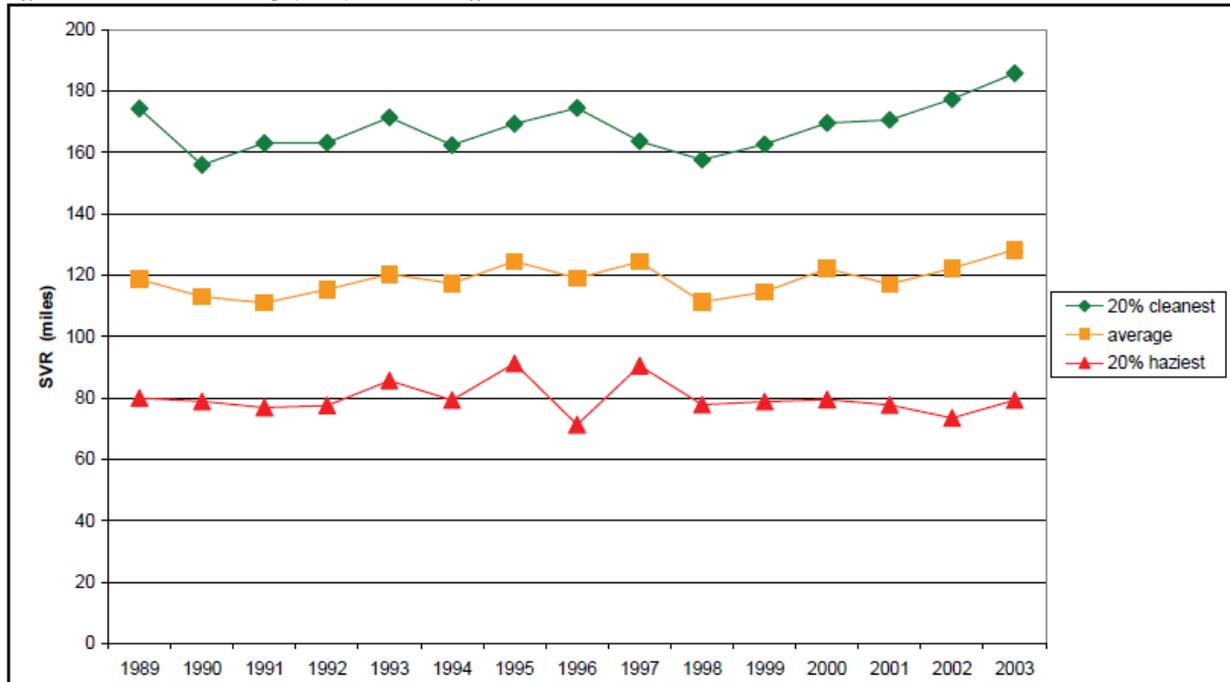

Table 3.4 National Parks, Wilderness Areas, and National Monuments in the Vicinity of the Casper Planning Area

Area Name	Closest Distance to the Casper Planning Area (miles)	Direction from the Casper Planning Area	Clean Air Act Status of the Area
Wind Cave National Park	75	East	Class I
Yellowstone National Park	>100	Northwest	Class I
Grand Teton National Park	>100	Northwest	Class I
Badlands National Park	>100	East	Class I
Jewell Cave National Monument	50	East	Class II
Cloud Peak Wilderness Area	65	North	Class II
North Absaroka Wilderness Area	>100	Northwest	Class I
Washakie Wilderness Area	>100	Northwest	Class I
Fitzpatrick Wilderness Area	100	West	Class I
Bridger Wilderness Area	90	West	Class I
Teton Wilderness Area	>100	Northwest	Class I

Source: NPS 2006

The BLM works cooperatively with several other federal agencies to measure visibility with the Inter-Agency Monitoring of Protected Visual Environments (IMPROVE) network. The IMPROVE station operating in the Class I area nearest to the planning area, approximately 90 miles to the west, is in the Bridger Wilderness Area. Figure 3-1 shows the visual range measured in the Bridger Wilderness Area over the last 15 years.

Figure 3.1 Annual Visibility (SVR) in the Bridger Wilderness Area.

3.2 Wildlife

3.2.1 Special Status Species

Section 7 of the ESA requires that BLM land managers ensure that any action authorized, funded, or carried out by the BLM is not likely to jeopardize the continued existence of any threatened or endangered species and that it avoids any appreciable reduction in the likelihood of recovery of affected species. Consultation is required on any action proposed by the BLM or another federal agency that affects a listed species or that jeopardizes or modifies critical habitat.

The BLM’s Special Status Species Policy outlined in BLM Manual 6840 is to conserve listed species and the ecosystems on which they depend and to ensure that actions authorized or carried out by BLM are consistent with the conservation needs of special status species and do not contribute to the need to list any of these species. The BLM’s policy is intended to ensure the survival of those plants that are rare or uncommon, either because they are restricted to specific uncommon habitat or because they may be in jeopardy due to human or other actions.

By BLM policy, species proposed for federal listing are to be managed with the same level of protection provided for threatened and endangered species. The policy for federal candidate

species and BLM sensitive species is to ensure that no action that requires federal approval should contribute to the need to list a species as threatened or endangered.

Other management direction is based on RMP management objectives, activity level plans, and other aquatic habitat and fisheries management direction, including 50 CFR 17, the Land Use Planning Handbook, Appendix C, Part E, Fish and Wildlife.

The current RMPs have evaluated the need to protect habitat necessary for the success of species identified through these regulations and policies. New information regarding the status of the Greater Sage-grouse has elevated its status from a BLM sensitive species to a federal candidate species. Policy was issued by the Wyoming BLM in December, 2009 under Information Memoranda 2010-012 and 2010-013; additional policy was issued by the Washington Office BLM under Information Memoranda 2010-071.

The Greater sage-grouse is a candidate species for listing under provisions of the ESA as determined by the USFWS and documented in a March 5, 2010 Federal Register notice declaring that listing of the Greater Sage Grouse was warranted but precluded. Greater sage-grouse are distributed in sagebrush habitat throughout the Casper Field Office, predominately in Natrona County. Greater sage-grouse leks are generally at mid elevations within sagebrush habitat. Nesting and brood-rearing habitat is sometimes associated with the lek and sometimes found at a distance from the lek in sagebrush habitat. These suitable sagebrush habitat areas could be productive for Greater sage-grouse; however, fragmentation and degradation might limit the distribution and abundance of Greater sage-grouse. The WGFD has identified core areas, which represent these relatively productive areas, and has suggested special management for these areas. In mid July, 2010, the WY Game and Fish Department also released Version 3 of their Sage Grouse Core Area boundaries. All parcels have been screened against this version in accordance with IM 2010-13. Specific information regarding each parcel can be found in Appendix B.

There are many sources of habitat fragmentation, all of which may affect the Greater sage-grouse. Industrial development, livestock grazing, mining, gravel pit operations, oil and gas activity, land exchanges and disposal, vegetation manipulation, fuel reduction projects and other activities may cause an artificial component to a natural habitat condition. Structures such as powerlines, towers and industrial disruptive activities may cause avoidance and abandonment of habitat. Livestock grazing, fuels treatments, and weed spread infestations are factors which may cause habitat degradation depending upon severity, intensity, and design. West Nile virus, which recently has had lethal effects on Greater sage-grouse in parts of Wyoming, could become an important factor in Greater sage-grouse survival. There has been little research to document the presence of the virus and its effect on Greater sage-grouse

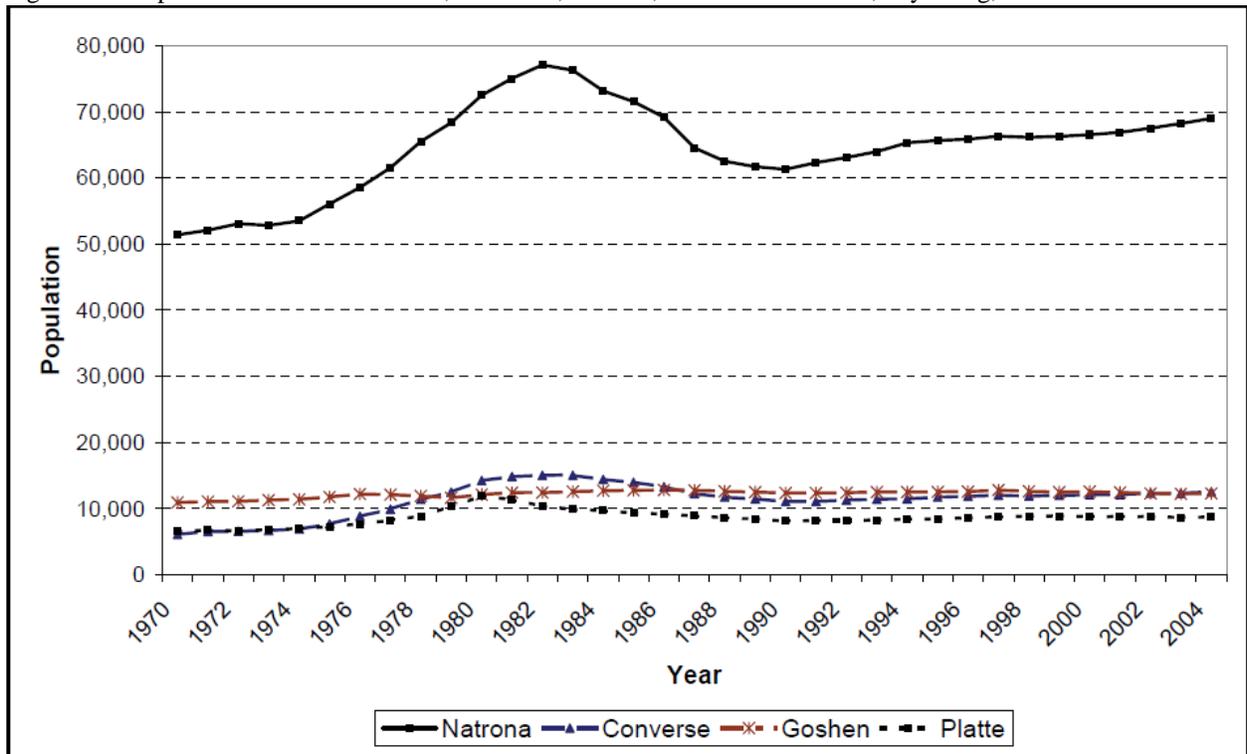

Greater sage-grouse have been declining across the west, which has prompted several petitions to list them as threatened under the ESA, including a recent petition that led to the March 5, 2010 finding by the USFWS of warranted for listing but precluded. Population levels throughout the

Planning Area declined during the mid 1990s. Since 2004, the levels have maintained or slightly increased. It is thought this resurgence was a result of well-timed precipitation events. These precipitation events promoted forage growth, which aided the survival of young. Population growth has varied throughout the Planning Area based on specific local conditions, with some areas showing little change; other areas have had a recent increase in lek count numbers.

3.3 Socio-economics

The four counties in the planning area are Natrona, Converse, Platte, and Goshen. As of 2004, Natrona was the most populous, with 69,010 people. Converse County had 12,515 people, Platte had 8,666 people, and Goshen had 12,286 people. Since 1970, the population has grown slowly and steadily in Goshen County. The remaining counties experienced rising population in the late 1970s into the early 1980s, a decline in population at some point in the 1980s, and slow growth since about 1990, with overall growth positive from 1970 to 2004 (BEA 2005; U.S. Census Bureau 2005a). Figure 3-2 provides a visual summary of population trends by county from 1970 to 2004.

Figure 3-2. Population Trends in Natrona, Converse, Goshen, and Platte Counties, Wyoming, from 1970 to 2004

Sources: BEA 2005; U.S. Census Bureau 2005a

The BLM administers 37 percent of the total area of Natrona County (approximately 1.1-million acres of the total 3-million acres), 5 percent of Converse County (approximately 130,000 of the 2.7-million acres), 6 percent of Platte County’s land (82,000 of the 1.35-million acres), and 2 percent of Goshen County (25,000 of the 1.4-million acres). However, the BLM also administers the subsurface mineral estate in all four counties of the socioeconomic study area. Thus, BLM’s management decisions could potentially affect social conditions in all four counties. However,

with respect to social conditions related to ranching, BLM's decisions have more potential to affect conditions in Natrona and Converse counties than in Goshen or Platte counties.

Mining and mineral production in the planning area constitutes the majority of economic activity in the planning area. Table 3-1 provides a summary of the quantity and value of mining production in the counties in the planning area, and for the state as a whole. Economically, the largest contributors to mining activity are oil and gas in Converse and Natrona counties and coal and uranium mining in Converse County. The Mineral Resources section of this document contains additional information about mineral resources in the planning area.

Table 3-1. Estimated Mineral Production and Value by County in the Casper Planning Area

Mineral	Natrona	Converse	Platte	Goshen	Wyoming
Production or Sales (units)					
Oil (bbls sold)*	2,920,191	1,863,333	0	0	50,167,571

4.0 ENVIRONMENTAL EFFECTS

4.1 Air Resources

4.1.1 Air Quality

Alternative A: No Action

Under the no action alternative, the monies received from those previously sold parcels where leases were not issued, would be refunded and no development would occur. Due to demand for oil and gas, it is expected that these parcels may be re-nominated in the future, consistent with appropriate land use planning decisions, and would be offered for sale with additional stipulations. There is no way to accurately predict what level of restrictions future leasing may require, but it can be assumed that a substantial portion of the development that would have been authorized under the leases currently sold would still be permitted under future leases. Nominations of parcels for lease under future land use plans and decisions would be screened for consistency with the land use plan in effect at the time, and the appropriate environmental analysis would be conducted to determine associated air quality impacts. Impacts to air quality from leases issued from any future sales would be analyzed in the appropriate environmental documents for those sales. Analysis of air quality impacts is also required at the time an application for a permit to drill is submitted.

A decision to not issue leases for any of the 313 parcels would support continued current uses of these parcels. These uses are primarily associated with grazing, with some dispersed recreation such as hunting and hiking. These uses typically entail vehicle travel for access, and would be expected to continue at current rates.

Alternative B: Proposed Action

Issuing leases for the subject tracts would have no direct impacts to air quality. Any potential effects to air quality would occur if and when the leases were developed. These wells would contribute a small percentage of the total emissions (including GHG's) from oil and gas activities in Wyoming.

Potential impacts of development could include increased air borne soil particles associated with the construction of new well pads, pipelines, or roads, exhaust emissions from drilling equipment, compressors, vehicles, and dehydration and separation facilities, as well as potential releases of GHG and volatile organic compounds during drilling or production activities. The amount of increased emissions cannot be quantified at this time since it is unknown how many wells might be drilled, the types of equipment needed if a well were to be completed successfully (e.g. compressor, separator, dehydrator), or what technologies may be employed by a given company for drilling any new wells. The degree of impact will also vary according to the characteristics of the geologic formations from which production occurs. Emissions of all regulated pollutants (including GHGs) and their impacts will be quantified and evaluated at the time that a specific development project is proposed.

In February 2005, the BLM Wyoming State Office Reservoir Management Group produced a draft Reasonably Foreseeable Development Scenario (RFD) document for the Casper Field

Office RMP revision. This document demonstrates that between 1,400 and 2,800 wells could be drilled from 2001 to 2020 (195 were drilled in 2001-2003). (The petroleum resources specific to these leases in the Proposed Action are not known whether they are gas or oil or a combination thereof). The absolute density of drilling depends upon the technology available (vertical, directional, or horizontal) and the geology of the hydrocarbon-bearing zone. As a result, it is unknown the specific numbers of wells that could potentially be drilled under a full field development scenario as a result of issuing the leases. However, the RFD takes these assumptions into account, and on a Field Office wide basis, is still valid. Current APD permitting trends within the field office confirm that these assumptions are still accurate as from October 1999 through September 30, 2009 the Casper Field Office has approved 805 APDs, or an average of 80 APDs per year.

Subsequent development of any leases issued, would contribute a small incremental increase in overall hydrocarbon emissions, including GHGs. When compared to total national or global emissions, the amount released as a result of potential production from the proposed lease tracts would not have a measurable effect.

According to the Reservoir Management Group RFD (Reasonable Foreseeable Development for Oil and Gas, Casper Field Office, Wyoming 2005) there are 50 coalbed gas wells have been drilled in the Casper Field Office since 1999. The RFD does assume that over the next twenty years, up to 7000 coalbed gas wells could be drilled.

Alternative C: Full Lease Issuance:

Under this alternative, leases would be issued with the aforementioned stipulations. However, due to the larger acreage under this Alternative potentially subject to surface disturbing activities, drilling and production, the potential for impacts are similar to, but have a higher probability of occurring in larger amounts, as under Alternative B.

Mitigation

None

4.1.2 Greenhouse Gas Emissions

Alternative A: No Action

A decision to not issue the leases would preclude oil and gas development that could contribute greenhouse gas emissions from these leases. However, as discussed previously under the no action alternative, this would not preclude future nomination, leasing, and development consistent with land use planning decisions at that time. Based on demand for oil and gas, it is expected that these parcels would be nominated in the future, consistent with appropriate land use planning decisions, and would be offered for sale with appropriate stipulations. There is no way to accurately predict what level of restrictions future leasing may require, but it can be assumed that a substantial portion of the development that would have been authorized under the leases currently sold would still be permitted under future leases. This would result in a postponement of development, and the possibility of the development occurring with increased restriction on greenhouse gas emissions. The levels and types of restrictions would be determined at the time of lease, and submittal of development activities for approval, but are

expected to allow for at least moderate development of areas open to leasing. Therefore, the no-action alternative would likely delay, and not prevent, greenhouse gas emissions. The no-action alternative may also result in reduced levels of emissions associated with future expanded restrictions.

See Section 4.4 for a discussion of the impacts of these potential greenhouse gas emissions on global climate change.

Alternative B: Proposed Action

The issuance of leases in itself would not result in any direct greenhouse gas emissions. However, in regard to future development, the assessment of GHG emissions and climate change is in its formative phase. While it is not possible to accurately quantify potential GHG emissions in the affected areas as a result of making the proposed tracts available for leasing, some general assumptions however can be made: issuing the proposed tracts may contribute to drilling new wells.

The Center for Climate Strategies (CCS) prepared the Wyoming Greenhouse Gas Inventory and Reference Case Projection 1990-2020 (Inventory) for the Wyoming Department of Environmental Quality (WYDEQ) through an effort of the Western Regional Air Partnership (WRAP). This inventory report presents a preliminary draft greenhouse gas (GHG) emissions inventory and forecast from 1990 to 2020 for Wyoming. This report provides an initial comprehensive understanding of Wyoming's current and possible future GHG emissions. The information presented provides the State with a starting point for revising the initial estimates as improvements to data sources and assumptions are identified.

The inventory report discloses that activities in Wyoming accounted for approximately 56 million metric tons (MMt) of carbon dioxide equivalent (CO₂e) emissions in 2005, an amount equal to 0.8% of total US gross GHG emissions. These emission estimates focus on activities in Wyoming and are *consumption-based*; they exclude emissions associated with electricity that is exported from the State. Wyoming's gross GHG emissions increased 25% from 1990 to 2005, while national emissions rose by only 16% from 1990 to 2004. Annual sequestration (removal) of GHG emissions due to forestry and other land-uses in Wyoming are estimated at 36 MMtCO₂e in 2005. Wyoming's per capita emission rate is more than four times greater than the national average of 25 MtCO₂e/yr. This large difference between national and State per capita emissions occurs in most of the sectors – Wyoming's emission per capita significantly exceed national emissions per capita for the following sectors: electricity, industrial, fossil fuel production, transportation, industrial process and agriculture. The reasons for the higher per capita intensity in Wyoming are varied but include the State's strong fossil fuel production industry and other industries with high fossil fuel consumption intensity, large agriculture industry, large distances, and low population base. Between 1990 and 2005, per capita emissions in Wyoming have increased, mostly due to increased activity in the fossil fuel industry, while national per capita emissions have changed relatively little.

Wyoming's gross GHG emissions are expected to continue to grow to 69 MMtCO₂e by 2020, 56% above 1990 levels. As shown in Figure ES-3, demand for electricity is projected to be the largest contributor to future emissions growth, followed by emissions associated with

transportation. Although GHG emissions from fossil fuel production had the greatest increase by sector in the period 1990 to 2005, the growth from this sector is projected to decline due to assumption of decreased carbon dioxide emissions from venting at processing plants.

As of 2008, the Inventory indicates that there over 33,000 oil and gas wells in the State. There are approximately 3,443 existing Federal oil and gas wells in the Casper Field Office, which account for approximately 10.4 percent of the total Federal wells in Wyoming. Therefore, GHG emissions from all wells within the field office amount to approximately 2.04 metric tons CO₂e annually (mt) ($19.6 \text{ mt} \times 0.104 = 2.0384 \text{ mt}$) assuming steady production and emission venting.

Based on this emission factor, each potential well that may be drilled on these parcels, if issued, could emit approximately 0.00059 mt CO₂e assuming. It is unknown what the drilling density may be for these parcels, if they were to be developed; therefore, it is impossible to predict what level of emissions could occur from development at this stage under the proposed action.

See Section 4.4 for a discussion of the impacts of these potential greenhouse gas emissions on global climate change. Emissions of all regulated pollutants (including GHGs) and their impacts will be quantified and evaluated at the time that a specific development project is proposed.

Alternative C: Full Lease Issuance

Under this alternative, leases would be issued with the appropriate stipulations as listed in Appendix A. However, due to the larger acreage under this Alternative potentially subject to surface disturbing activities, drilling and production, the potential for greenhouse gas emissions are similar to, but have a higher probability of occurring in larger amounts, as under Alternative B.

See Section 4.4 for a discussion of the impacts of these potential greenhouse gas emissions on global climate change. Emissions of all regulated pollutants (including GHGs) and their impacts will be quantified and evaluated at the time that a specific development project is proposed.

Mitigation

The BLM holds regulatory jurisdiction over portions of natural gas and petroleum systems, identified in the EPA Inventory of US Greenhouse Gas Emissions and Sinks document. Exercise of this regulatory jurisdiction has led to development of “Best Management Practices (BMPs)” designed to reduce emissions from field production and operations. Analysis and approval of future development on the lease parcels would include applicable BMPs as conditions of approval (COAs) in order to reduce or mitigate GHG emissions. Additional measures developed at the project development stage would be incorporated as COAs in the approved APD or with a programmatic EIS, which are binding on the operator.

Such mitigation measures may include, but are not limited to:

- Flare hydrocarbon and gases at high temperatures in order to reduce emissions of incomplete combustion through the use of multi-chamber combustors;
- “Green” (flareless) completions,
- Water dirt roads during periods of high use in order to reduce fugitive dust emissions;

- Require that vapor recovery systems be maintained and functional in areas where petroleum liquids are stored;
- Installation of liquids gathering facilities or central production facilities to reduce the total number of sources and minimize truck traffic,
- Use of natural gas fired or electric drill rig engines,
- The use of selective catalytic reducers on diesel-fired drilling engines; and,
- Re-vegetate areas of the pad not required for production facilities to reduce the amount of dust from the pads.

The EPA Inventory data show that adoption by industry of the Best Management Practices proposed by the EPA's Natural Gas Energy Star program has reduced emissions from oil and gas exploration and development (Inventory of US Greenhouse Gas Emissions and Sinks: 1990-2006). The Casper Field Office will work with industry to facilitate the use of the relevant BMPs for operations proposed on federal mineral leases where such mitigation is consistent with agency policy.

4.2 Wildlife

4.2.1 Special Status Species

Alternative A: No Action

Under the No-Action alternative, oil and gas development of the 313 parcels would not occur. Therefore, no impacts would result from BLM actions. Additionally, activities in Sage Grouse Core Areas would be limited to those associated with current land uses, primarily recreation and agriculture. Sage Grouse Core Areas are identified by the state of Wyoming and adjusted to include additional habitat identified in consultation with the local WY Game and Fish office. In early July 2010, the Game and Fish Department released Version 3 of these boundaries; approximately 11,477.22 acres of Sage Grouse Core Area habitat has been identified in 7 parcels; these parcels would not be developed, consistent with the WY Governor's strategy and IM 2010-012 to conserve the species in support of the USFWS finding of Warranted but Precluded until completion of the RMP amendment. As discussed previously, many of these parcels may be eligible for nomination, lease, and development in the future, and could be leased subject to appropriate levels of restriction identified in the RMP at the time.

Alternative B: Proposed Action

Under this alternative 241 parcels would be recommended for issuance and 72 parcels would be recommended for deferral of issuance. Of these 72 parcels, 5 would receive a recommendation for deferral of issuance specifically because they have been identified as meeting the criteria for Sage Grouse Core Area in accordance with IM 2010-13. An additional 33 parcels are recommended for deferral for Greater Sage-grouse habitat protection pending the amendment of the Casper RMP. Approximately 55,999.90 acres of development would be curtailed sage grouse management is defined in the Casper RMP amendment. Development of 7 parcels containing 11,477.22 acres of sage grouse core habitat would also be curtailed pending completion of the Casper RMP amendment. The RMP amendment may dictate new sage grouse stipulations and until stipulations in accordance with the Sage Grouse Core strategy could be attached to leases for the affected parcels and management direction is codified in a Record of

Decision for the Casper RMP amendment. Once the lease stipulations are revised, the High Bidder would be given a chance to accept or reject those changes. If the changes are rejected BLM would return all monies received a result of the sale and the parcels would not be subject to development unless and until offered and leased at a future lease sale. All other impacts are the same as those described in the Casper RMP as they relate to Sage Grouse.

Alternative C: Full Lease Issuance

Under this alternative, lease for all 313 parcels would be issued or be allowed to be issued with the stipulations as detailed in Appendix A. Under this alternative approximately 11,477.22 acres of Greater Sage-grouse Core Areas would be subject to surface disturbing activities. The potential for impacts are similar to, but have a higher probability of occurring and at a greater intensity, as under Alternative B. Without conformance with the WY Sage-grouse Core Area Conservation Strategy, it is likely that the Sage-grouse would be listed as a T&E species; such a listing would violate the BLM Sensitive Species policy as authorized under BLM Manual 6840.

Mitigation

Modification of the stipulations for 6 parcels is recommended to ensure continued population and habitat objectives for the Greater Sage-grouse in accordance with IM 2010-12. Additional mitigation and/or Conditions of Approval could be identified at the development stage to further minimize impacts associated with oil and gas development.

4.3 Socio-economics

Alternative A-- No Action:

Under this alternative, no leases would be issued and no development under those leases would occur. As primarily rural communities that rely heavily on energy development revenue and agricultural uses, the communities in the leasing areas are likely to be negatively impacted by loss of potential revenue from subsequent development, of these parcels. However, the pace of development has historically been slower than that in many areas of the state, with approximately 80 Applications for Permits to Drill (APD) approved per year. Because there is demand for oil and gas, it is expected that if the leases are not issued the parcels will be re-nominated and leased in the future under more stringent stipulations. This would still allow for development of leases, and generation of revenue from Federally-managed minerals. Therefore, it is an assumption that the No Action Alternative (no lease option) may result in a slight reduction in domestic production of oil and gas. This would likely result in reduced Federal and State royalty income, and the potential for Federal land to be drained by wells on adjacent private or state land.

Under the No-Action alternative, the BLM will be expected to refund \$46,007,501.50 in bonus bids, filing fees, and rental fees. By law, the BLM provides approximately 50% of that revenue to the State of Wyoming. This represents a loss of considerable revenue to the State of Wyoming and to the Federal Government. Appendix B lists each parcel and the monies that were received for each lease sold during the period of June 2008 through May 2010.

Consumption of oil and gas developed from the proposed lease parcels is expected to produce GHGs. Consumption is driven by a variety of complex interacting factors including energy costs,

energy efficiency, availability of other energy sources, economics, demography, and weather or climate.

Alternative B – Proposed Action:

Under this alternative, 231 leases would be issued and 10 parcels would continue to be available for purchase through the non-competitive process. This would result in revenue of approximately \$43,340,345.00 for the Federal and State government, and a need to refund approximately \$2,667,096.52 of already-purchased parcels. Development of the issued leases would proceed consistent with the Reasonable Foreseeable Development report, at approximately 60 wells per year coming into production. Specific economic impacts would be identified in the NEPA document supporting the Application for Permit to Drill, when a more accurate analysis is possible based on the speculative nature of leasing in relation to development.

Alternative C-- Full Lease Issuance:

Under this alternative, all leases would be issued. This would provide the most opportunity for development of oil and gas, and the most revenue for the Federal government and the State (over \$46M). Under this alternative, no money would be refunded.

Mitigation

None.

4.4 Cumulative Impacts

There are approximately 3,443 Federal producing wells in the Casper Field Office; there are 10 producing coalbed methane production wells.

Analysis of cumulative impacts for reasonably foreseeable development (RFD) of oil and gas wells on public lands in the Casper Field Office is presented in the Casper RMP/FEIS. Potential development of all available federal minerals in the field office, including those in the proposed lease parcels, was included as part of the analysis.

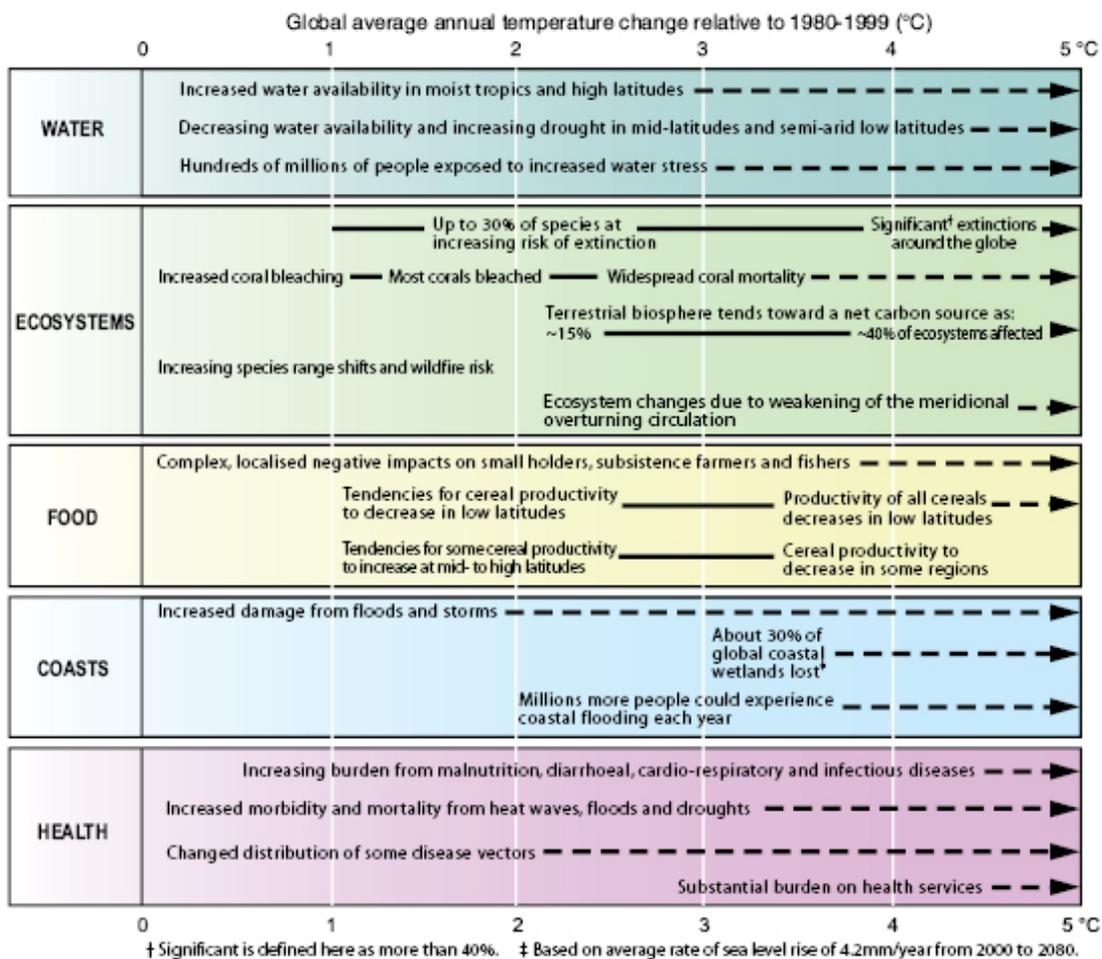

As described in the analysis of environmental consequences, the proposed action and/or the alternative may contribute to the effects of climate change to some extent through GHG emissions. However, it is not currently possible to associate any of these particular actions with the creation of any specific climate-related environmental effects. The lack of scientific tools designed to predict climate change at regional or local scales limits the ability to quantify potential future impacts.

The assessment of greenhouse gas (GHG) emissions and climate change is still in its formative phase; therefore, it is not yet possible to know with confidence the net impact on climate. However, the Intergovernmental Panel on Climate Change (IPCC 2007) recently concluded that “warming of the climate system is unequivocal” and “most of the observed increase in globally average temperatures since the mid-20th century is very likely due to the observed increase in anthropogenic [man-made] greenhouse gas concentrations.” As the temperatures of the land and sea change, environmental factors such as weather patterns, sea levels, precipitation rates, the timing of the seasons, desert distribution, forest cover, and

ocean salinity will also change. These changes influence the world's climate systems and will have different impacts to different areas. Some agricultural regions may become more arid while others become wetter; some mountainous areas will experience greater summer precipitation, yet experience disappearing snowpack.

Based on research compiled for the International Panel on Climate Change Fourth Assessment Report, 2007, potential effects of climate change on resources in the affected environment are likely to be varied. Figure 4.1, taken from the Fourth Assessment Report indicates varying responses of the natural world to increasing temperatures as a result of increasing global temperatures.

Figure 4.1: Examples of impacts associated with global average temperature change (Impacts will vary by extent of adaptation, rate of temperature change and socio-economic pathway)

Within North America, the report specifically forecasts that: Warming in western mountains is projected to cause decreased snowpack, more winter flooding and reduced summer flows, exacerbating competition for over-allocated water resources; in the early decades of the century, moderate climate change is projected to increase aggregate yields of rain-fed agriculture by 5 to 20%, but with important variability among regions; major challenges are projected for crops that

are near the warm end of their suitable range or which depend on highly utilized water resources; cities that currently experience heat waves are expected to be further challenged by an increased number, intensity and duration of heat waves during the course of the century, with potential for adverse health impacts and coastal communities and habitats will be increasingly stressed by climate change impacts interacting with development and pollution. Specific modeling and/or assessments of the potential effects for the Casper Field Office and for the State of WY currently do not exist.

Global mean surface temperatures have increased nearly 1.8°F from 1890 to 2006. Models indicate that average temperature changes are likely to be greater in the Northern Hemisphere. Northern latitudes (above 24°N) have exhibited temperature increases of nearly 2.1° F since 1900, with nearly a 1.8°F increase since 1970 alone. Without additional meteorological monitoring systems, it is difficult to determine the spatial and temporal variability and change of climatic conditions, but increasing concentrations of GHGs are likely to accelerate the rate of climate change.

Based on a 0.00059 mt/well emission factor (See Section 4.2), an RFD of 60 wells drilled and produced per year would result in approximately 0.0354 mt of CO₂e, potentially being added to the current levels associated with oil and gas development in the Newcastle Field Office. It is unknown what the drilling density may be for these parcels, if they were to be developed; therefore, it is impossible to predict what level of emissions could occur from development at this stage under the proposed action.

The average number of oil and gas wells drilled annually in the Field Office and probable GHG emission levels, when compared to the total GHG emission estimates from the total number of Federal oil and gas wells in the State, represent an incremental contribution to the total regional and global GHG emission levels. This incremental contribution to global GHG gases cannot be translated into incremental effects on climate change globally or in the area of these site-specific actions. As oil and gas and natural gas production technology continues to improve in the future, one assumption is that it may be feasible to further reduce GHG emissions.

Regarding the linkage between climate change related warming and associated impacts, an assessment of the IPCC states that difficulties remain in attributing observed temperature changes at smaller than continental scales. Therefore, it is currently beyond the scope of existing science to predict climate change on regional or local scales resulting from specific sources of GHG emissions. Emissions of all regulated pollutants (including GHGs) and their impacts will be quantified and evaluated at the time that a specific development project is proposed.

Significant uncertainties remain with respect to the estimates of the current level of emissions and projections of future production of fossil fuels as the oil and gas industry is difficult to forecast with the mix of drivers: economics, resource supply, demand, and regulatory procedures. The assumptions used for the projections, based on recent trends or State production trends in the near-term, and AEO2006 growth rates through 2020, do not include any significant changes in energy prices, relative to today's prices. Large price swings, resource limitations, or changes in regulations could significantly change future production and the associated GHG emissions. Other uncertainties include the volume of GHGs vented from gas processing facilities

in the future, any commercial oil shale or coal-to-liquids production, and potential emissions-reducing improvements in oil and gas production, processing, and pipeline technologies.

Black Mountain Wind Park, LLC (Black Mountain) has submitted an application and Plan of Development to develop a 105 MW wind energy facility, consisting of approximately 50 wind turbine in western Natrona County. The Proposed Project ROW will consists of 4,313 acres (6.7 square miles) consisting of 40 acres of state managed public land (1%), 3,878 acres of BLM managed public land (90%), and 395 acres of lands under private ownership (9%) Black Mountain is planning to place approximately 50 2.1 MW wind turbines along the rolling hills of Black Mountain. Approximately 43 of the turbines will be sited on public lands and approximately 7 turbines will be sited on lands under private ownership. The Proposed Project will involve siting approximately 50 wind turbines in linear strings along the rolling hills of Black Mountain. In addition to the siting of wind turbines, the Proposed Project will require the construction of new access roads, an overhead transmission line, an electrical substation, an electrical interconnection facility/switchyard, an O&M building, and laydown areas that may also serve as batch plant locations during construction. It construction activities will encompass approximately 224.9 acres of temporary disturbance and 40.7 acres of permanent disturbance.

5.0 Description of Mitigating Measures and Residual Impacts

The issuance of those leases identified under the proposed action will be mitigated by attaching appropriate conditions of approval to any subsequent requests for lease development either on a case by case basis or upon receipt of a multi-well project proposal. The Casper Field Office, Surface Use and Occupancy Requirements, Conditions of Approval, and the Casper Field Office's Special Leasing Stipulations, which are in place at the Wyoming State Office, will provide adequate mitigation for issuance of all lease parcels under the Proposed Action.

Direct, indirect, cumulative and residual impacts of leasing and lease development are generally described in the Casper RMP. An environmental analysis will be prepared on a case-by-case basis upon receipt of future subsequent actions.

TLS (1) Nov 15 to Apr 30; (2) as mapped on the Casper Field Office GIS database; (3) protecting big game on crucial winter range.

CSU (1) Surface occupancy or use within 1/4 mile of Class I and Class II waters may be restricted or prohibited unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts; (2) as mapped on the Casper Field Office GIS database; (3) protecting Class I and Class II waters.

CSU (1) Surface occupancy or use will be restricted or prohibited unless the operator

and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts; (2) as mapped on the Casper Field Office GIS database; (3) protecting Class I and/or Class II Visual Resource Management Areas.

CSU (1) Surface occupancy or use within 1/4 mile or visual horizon of the trail, whichever is closer, may be restricted or prohibited unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts; (2) as mapped on the Casper Field Office GIS database; (3) protecting cultural and scenic values of the Oregon Trail.

CSU (1) The lease area may now or hereafter contain plants, animals, or their habitats determined to be threatened, endangered, or other special status species. BLM may recommend modifications to exploration and development proposals to further its conservation and management objective to avoid BLM-approved activity that will contribute to a need to list such a species or their habitat. BLM may require modifications to or disapprove proposed activity that is likely to result in jeopardy to the continued existence of a proposed or listed threatened or endangered species or result in the destruction or adverse modification of a designated or proposed critical habitat. BLM will not approve any ground-disturbing activity that may affect any such species or critical habitat until it completes its obligations under applicable requirements of the Endangered Species Act as amended, 16 U.S.C. § 1531 et seq., including completion of any required procedure for conference or consultation; (2) as mapped on the Casper Field Office GIS database; (3) protecting *Spiranthes diluvialis* (Ute ladies'-tresses); Species affected by water depletions from the Platte River system; *Zapus hudsonius preblei* (Preble's meadow jumping mouse).

CSU (1) Surface occupancy or use within 1/4 mile of Class I and Class II waters may be restricted or prohibited unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated

impacts; (2) as mapped on the Casper Field Office GIS database; (3) protecting Class I and Class II waters.

CSU (1) The lease area may now or hereafter contain plants, animals, or their habitats determined to be threatened, endangered, or other special status species. BLM may recommend modifications to exploration and development proposals to further its conservation and management objective to avoid BLM-approved activity that will contribute to a need to list such a species or their habitat. BLM may require modifications to or disapprove proposed activity that is likely to result in jeopardy to the continued existence of a proposed or listed threatened or endangered species or result in the destruction or adverse modification of a designated or proposed critical habitat. BLM will not approve any ground-disturbing activity that may affect any such species or critical habitat until it completes its obligations under applicable requirements of the Endangered Species Act as amended, 16 U.S.C. § 1531 et seq., including completion of any required procedure for conference or consultation; (2) as mapped on the Casper Field Office GIS database; (3) protecting *Spiranthes diluvialis* (Ute ladies'-tresses); Species affected by water depletions from the Platte River system.

Lease Notice No. 3

Special Lease Stipulation

TLS (1) Nov 15 to Apr 30; (2) as mapped on the Casper Field Office GIS database; (3) protecting big game on crucial winter range.

CSU (1) Surface occupancy or use within 1/4 mile of Class I and Class II waters may be restricted or prohibited unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts; (2) as mapped on the Casper Field Office GIS database; (3) protecting Class I and Class II waters.

CSU (1) Surface occupancy or use within 50,000 feet of the Casper Airport may be prohibited or restricted unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts; (2) as mapped on the Casper Field Office GIS database; (3) protecting aircraft fly zones.

CSU (1) The lease area may now or hereafter contain plants, animals, or their habitats determined to be threatened, endangered, or other special status species. BLM may recommend modifications to exploration and development proposals to further its conservation and management objective to avoid BLM-approved activity that will contribute to a need to list such a species or their habitat. BLM may require modifications to or disapprove proposed activity that is likely to result in jeopardy to the continued existence of a proposed or listed threatened or endangered species or result in the destruction or adverse modification of a

designated or proposed critical habitat. BLM will not approve any ground-disturbing activity that may affect any such species or critical habitat until it completes its obligations under applicable requirements of the Endangered Species Act as amended, 16 U.S.C. § 1531 et seq., including completion of any required procedure for conference or consultation; (2) as mapped on the Casper Field Office GIS database; (3) protecting *Penstemon haydenii* (Blowout penstemon); *Spiranthes diluvialis* (Ute ladies'-tresses).

TLS (1) Mar 15 to Jul 15; (2) as mapped on the Casper Field Office GIS database; (3) protecting nesting Greater sage-grouse.

CSU (1) The lease area may now or hereafter contain plants, animals, or their habitats determined to be threatened, endangered, or other special status species. BLM may recommend modifications to exploration and development proposals to further its conservation and management objective to avoid BLM-approved activity that will contribute to a need to list such a species or their habitat. BLM may require modifications to or disapprove proposed activity that is likely to result in jeopardy to the continued existence of a proposed or listed threatened or endangered species or result in the destruction or adverse modification of a designated or proposed critical habitat. BLM will not approve any ground-disturbing activity that may affect any such species or critical habitat until it completes its obligations under applicable requirements of the Endangered Species Act as amended, 16 U.S.C. § 1531 et seq., including completion of any required procedure for conference or consultation; (2) as mapped on the Casper Field Office GIS database; (3) protecting *Centrocercus urophasianus* (Greater sage-grouse).

BLM may recommend modifications to exploration and development proposals to further its conservation and management objective to avoid BLM-approved activity that will contribute to a need to list such a species or their habitat. BLM may require modifications to or disapprove proposed activity that is likely to result in jeopardy to the continued existence of a proposed or listed threatened or endangered species or result in the destruction or adverse modification of a designated or proposed critical habitat. BLM will not approve any ground-disturbing activity that may affect any such species or critical habitat until it completes its obligations under applicable requirements of

the Endangered Species Act as amended, 16 U.S.C. § 1531 et seq., including completion of any required procedure for conference or consultation; (2) as mapped of the Casper Field Office GIS database; (3) protecting *Centrocercus urophasianus* (Greater sage-grouse); *Cynomys leucurus* (white-tailed prairie-dog).

Lease Notice No. 3

Special Lease Stipulation

CSU (1) The lease area may now or hereafter contain plants, animals, or their habitats determined to be threatened, endangered, or other special status species. BLM may recommend modifications to exploration and development proposals to further its conservation and management objective to avoid BLM-approved activity that will contribute to a need to list such a species or their habitat. BLM may require modifications to or disapprove proposed activity that is likely to result in jeopardy to the continued existence of a proposed or listed threatened or endangered species or result in the destruction or adverse modification of a designated or proposed critical habitat. BLM will not approve any ground-disturbing activity that may affect any such species or critical habitat until it completes its obligations under applicable requirements of the Endangered Species Act as amended, 16 U.S.C. § 1531 et seq., including completion of any required procedure for conference or consultation; (2) entire lease; (3) protecting Species listed under the Endangered Species Act as amended, 16 U.S.C. § 1531 et seq.

Lease Notice No. 3

Special Lease Stipulation

CSU (1) The lease area may now or hereafter contain plants, animals, or their habitats determined to be threatened, endangered, or other special status species. BLM may recommend modifications to exploration and development proposals to further its conservation and management objective to avoid BLM-approved activity that will contribute to a need to list such a species or their habitat. BLM may require modifications to or disapprove proposed activity that is likely to result in jeopardy to the continued existence of a proposed or listed threatened or endangered species or result in the destruction or adverse modification of a designated or proposed critical habitat. BLM will not approve any ground-disturbing activity that may affect any such species or critical habitat until it completes its obligations under applicable requirements of the Endangered Species Act as amended, 16 U.S.C. § 1531 et seq., including completion of any required procedure for conference or consultation; (2) as mapped on the Casper Field Office GIS database; (3) protecting *Penstemon haydenii* (Blowout penstemon).

TLS (1) Feb 1 to Jul 31; (2) as mapped on the Casper Field Office GIS database; (3) protecting nesting Raptors.

CSU (1) The lease area may now or hereafter contain plants, animals, or their habitats determined to be threatened, endangered, or other special status species. BLM may recommend modifications to exploration and development proposals to further its conservation and management objective to avoid BLM-approved activity that will contribute to a need to list such a species or their habitat. BLM may require modifications to or disapprove proposed activity that is likely to result in jeopardy to the continued existence of a proposed or listed threatened or endangered species or result in the destruction or adverse modification of a designated or proposed critical habitat. BLM will not approve any ground-disturbing activity that may affect any such species or critical habitat until it completes its obligations under applicable requirements of the Endangered Species Act as amended, 16 U.S.C. § 1531 et seq., including completion of any required procedure for conference or consultation; (2) entire lease; (3) protecting Species listed under the Endangered Species Act as amended, 16 U.S.C. § 1531 et seq.
